When the official awards are out, competitors begin to unseal their lips; and I have heard many sensational items since the medals were allotted. But it is only fair to add that the great majority of the gold medal winners got through without trouble and without infringing the rules.

Overheating or Overloading? A Curious Phenomenon.

On August 24th I described an experience with a overhead inlet valve. The tappet and rocker had worn down a trifle so that the valve opened late and closed early, the spring being too strong to permit the valve to function automatically, independently of the tappet action. Loss of power naturally resulted, accompanied by abnormal engine heat. A week later one of my most precise readers objected to my use of the word "overheating" in describing the behaviour of the engine. Almost simultaneously I notice a report by Mr. B. H. Davies of a somewhat similar trouble with an engine of a different make, when he was climbing Keighley Gate in the Six Days. In his case the tappet adjuster nut shook loose, and reduced his inlet valve "drop" to $\frac{3}{32}$ in. Like myself, he suffered from loss of power, but no heating accompanied it. In fact, he goes so far as to say that after he had climbed the hill on the instalment system, running alongside for much of the ascent, his engine was almost stone cold. I instantly verified the diverse results on my own engine. If my inlet valve is adjusted with a slightly excessive gap at the tappet and rocker; I get loss of power plus a hot engine; if the gap is made so excessive that the valve hardly opens at all; I get loss of power plus a very chilly engine. The real trouble in both cases is no doubt correctly described as "overloading."

Which is the Stiffest Trial?

A discussion has been raging amongst the leading competition riders as to which six days' trial has proved the most severe on record. I have been exchanging views with a number of the riders, and with pressmen and others who have attended all the recent events, and their almost unanimous opinion places the trials in the following order of severity:

1. The Scottish Trials of 1910.
2. The Scottish Trials of 1911.
3. The A.C.U. Harrogate Trials of 1911.

Last year's Scottish Trials are considered to have combined the greatest amount of severe hill-climbing with the worst surfaces on record. Such hills as Glendoe, Cairnwell, Cockbridge, and Amulree were notably worse than any of the Yorkshire acclivities, while the surfaces were notoriously execrable. The 1911 Scottish Trials were probably inferior to the Harrogate Trials, so far as the compulsory hills were concerned, but on several days the going was simply dreadful from start to finish, a rare combination of grease and rough roads being provided.

In the Harrogate Trials there was a record quantity of hill-climbing, but not one of the hills exhibited that conjunction of phenomenal gradient and unique cornering which is calculated to unseat a first class rider on a first class variably geared machine, while there was not one mile of grease in the entire trial. Had the weather been bad in the A.C.U. Trial it could probably have taken first place for severity.

A COMFORTABLE LOW-BUILT SIDECAR.

THE accompanying illustrations are of an interesting sidecar attachment of registered design, submitted to us by Mr. W. S. Turner, Wyncolm, Streetly, near Birmingham. The shape of the low-built sidecar is distinctly original, and its uncommon appearance attached to an equally low-built four-cylinder three-speed T.A.C. attracts much attention.

We are told—and we can readily believe—that the attachment is perfectly weather and wind proof with its covered in canoe-like front, and the sitting position is recumbent like a modern two-seated car. The screen and top lift up for the entrance. Being long and low it gives the minimum of wind resistance. Since the photographs were taken a hood has been added and the passenger is kept cosy and dry, even if rain is pouring in torrents.

The sidecar has undoubtedly come to stay, but so far comparatively few makers have launched out on original lines. There is no reason why every sidecar should not be handsome in appearance as our illustrations testify.

Mr. W. S. Turner's registered design sidecar.

THE SPIDER QUAD.

FOR more than four months I have owned and driven a light air-cooled quadcar, and in my opinion it is perfectly practicable, and is no more limited in its scope than a motor bicycle and sidecar. The machine I have weighs about 5 cwt., and cost about £95. As regards comfort it takes precedence of a bicycle and sidecar, as anyone who has driven both types in a storm of wind and rain will readily admit. Now, to my mind, one of the real difficulties in designing a quad is to decide on the nature of the body. Sheet-iron, backed by wood, and wicker-work both have their drawbacks. The former is much inclined to rattle, and also magnifies sound; the latter does not last well, and looks extremely "gauche" and out of place. Of the two I should prefer a sheet iron body properly stayed. My own car has a body of this description, but this originally was not sufficiently stayed, and rattled a good deal. A writer in this journal some time ago made very disparaging remarks about seats of the deck-chair type. Now, I can assure him that I find my seats very comfortable, and so do my passengers. They are simply leather, arranged on the lines of the

Some Experiences and Deductions.

ordinary canvas deck-chair, and their weight is just 8 ounces.

If a man wants a padded, upholstered easy chair style of seat, he had better buy a car.

Let us remember that these four-wheeled Spider quads are a compromise, and for £90 or so do not let us expect the comfort and luxury of a £300 car. For his £90 a buyer of a well-designed quad gets more than the comfort of a sidecar, and more than the speed of any car up to 20 h.p. My little quad will now do forty-eight miles an hour with a gear of 4 $\frac{2}{3}$ to 1, which speaks well for the 7 h.p. twin J.A.P.

Now one word about gears, and I have had my say.

Why will makers of these quads fit a dog clutch gear? In my opinion, it is too tricky to handle. Mine collapsed twice with most careful handling, and I see that a similar fate overtook Morgan—a plucky pioneer—in the Six Days' Trials. Why not fit an epicyclic gear, which a novice or a lady can easily handle? This is a good "talking point." At any rate, let us have no more clutches with their jar and clatter, and their need for the greatest care in changing gear.

"MUGWUMP, M.B."

Further views of the low-built T.A.C. and sidecar referred to on this page.

A New Lucas Lamp and Generator Bracket.

FOR use with their well-known "King of the Road" motor cycle projectors and generators, Messrs. Joseph Lucas, Ltd., Great King Street, Birmingham, have recently introduced a new adjustable bracket which is quite one of the most effective things of its type that we have yet seen. It will be remembered that the earlier combination brackets designed to support both the generator and the lamp from the handle-bar, were intended to be affixed to the handle-bar stem. The new

Fig. 2.

every shape, and they allow also for a very wide choice in the relative positions of the generator and head lamp. Fig. 2 illustrates one of these positions in which the lamp is kept high. As a matter of fact, however, it can be put even higher, or can be brought down so as to be level with the generator.

Fig. 3 indicates how useful the bracket is in the event of punctures or other repairs having to be carried out by the roadside at night. To obtain a light on

Fig. 3.

Fig. 1.

pattern, however, is clipped to the handle-bar itself and thus allows the combination to be fitted without alteration on almost any motor cycle, whether there be a fixed existing lamp bracket or not.

Fig. 1 illustrates the combination carrier which it will be seen comprises no cast lugs, etc., all such portions being steel stampings, which in addition to being much neater in pattern, are also much lighter in weight. The various members of the carrier are articulated to one another in such a way that they can easily be made to fit handle-bars of any and

the rear of the machine it is only necessary to undo one of the wing nuts which bind the head lamp to one of the carrier clips, and to swivel the lamp on the other clip, when it can be faced backwards, as shown in the diagram.

A New Generator.

In the annexed diagrams is shown a new type of generator which Messrs. Lucas have recently introduced, and which takes the place of the type with the underneath swing clip for binding the carbide container to the water chamber.

Fig. 4.

The new type is shown in fig. 4, and is of very simple and sound construction. The rim of the carbide container is forced against a rubber washer attached to the base of the water container by a perforated cup, on the top edge of which are two small ledges which engage with a coarse cut thread in the base of the water container. This thread consists of a helically wound strip, and there is no possibility of "crossing" the threads or screwing up in any but the right manner.

The attachment of the clips has also been strengthened by carrying them in a stout ring encircling the water container.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By ROAD RIDER.

SOME RUDGE-WHITWORTH TIPS.

370. To remove an R.W. exhaust valve, unscrew the sparking plug and put the handle of the Quickgrips through the plug hole. This will keep the exhaust valve down on its seat, and a little leverage with a screwdriver will instantly raise the spring and enable the cotter to be withdrawn. This plan is quicker and easier than the use of any patent tool on this engine.

In removing the cylinder there is no need to disconnect the exhaust pipe. Simply loosen the nuts on the front footrest, lower the silencer, and then raise the cylinder when the exhaust pipe will lift out of the silencer. The exhaust pipe may be withdrawn with the cylinder, if the connecting rod is at the back of the slot in the crank case, and the piston is tilted forward. The cylinder should be turned round to the pulley side of the machine, and it may then be pulled off with the exhaust pipe still attached to it.

Oil the overhead inlet valve rocker at intervals, or its spindle will wear loose in its carrier, and become noisy.

Whenever the rear axle nuts are touched their threads should be cleaned with paraffin and oiled, otherwise the advantages of the quick detachable wheels will be lost, owing to one nut or the other becoming tight on its thread. A screwdriver slot may be filed in one end of the spindle, which enables the spindle to be held while the nuts are removed. The cone adjusting nut on both axles is on the left-hand end, and, of course, the axle nut and cone on the right-hand side of the spindle should be tight home before the cone is adjusted.

The oil pump ball valve is, as is usually the case, a somewhat delicate fitting. If the oil pump appears to be working irregularly, delivering a small charge, or very stiff to operate, the valve should be unscrewed from the underside of the tank and washed in paraffin, to clear out any grit. There is no need to take it to pieces. If there is oil in the tank, an ordinary whisky cork will plug the hole while the valve is out.

A BELT TIP.

371. When a belt requires shortening always cut that end which was not

cut on the last occasion of taking a bit out. Thus you ensure the alternate renewal of each bolt hole and reduce the probability of a pull through to the minimum. Some inexperienced riders cut off either end at random, and, as a consequence, their belts often pull through and become too short. If a belt becomes so short that the insertion of a second fastener is necessary to restore it to a working length, fit one fastener of the fixed type. If a belt contains two hook fasteners it is irritating to handle.

CARRYING A ROUTE CARD.

372. In competitions, or indeed on any lengthy ride across a strange country, it is convenient to carry a route card somewhere on the machine in constant sight, without having to ferret in the pockets at intervals. A good tip is to lay the card against the acetylene generator (now usually mounted on a bracket projecting backwards from the steering head), and secure it by slipping a couple of rubber rings round the top and bottom of the generator barrel. The card is then always in sight, and being vertical, no rain will remain on it to spoil it.

The City & West End Motor House
117, LONG ACRE, LONDON, W.C.

RELIABLE ACCESSORIES AT
London's Lowest Prices

"ANTARNISH."

A non-greasy, weather-proof and INVISIBLE Lacquer for applying to the plated parts of Motor Cars, Cycles, etc., and also to bare clean steel, brass, or any other metal.

Price per tin, 9d. Postage 2d.

"COVEROLE."

For Repairing Leaky Petrol Tanks. Pipes, Unions, etc.

DIRECTIONS:

For Worn Unions.—Paint the threads and cone liberally with Coverole, screw up tightly and give a final application to the outside.

For Cracked Pipes, &c.—Smear a piece of paper, canvas, tape or similar material with Coverole, and wrap tightly round the pipe.

Price 1/- Postage 2d.

"ROSCO" CYLINDER PAINT.

Keeps the engine cool, prevents overheating, produces a smooth dead black surface. Unaffected by heat or water.

Price per tin, 6d.

Postage 2d.

THE H.H. BELT PUNCH AND CUTTER.

Both the cutter and punch are easily removable for sharpening, and either can be immediately renewed at the cost of a few pence—this is an advantage not to be obtained in any other punch.

Suitable for all size belts.

Price 5/-.

Postage 2d.

IMMEDIATE DELIVERY

of Motor Cycle Tyres. All standard sizes stocked. Chucher A Won, rubber-studded, 26 x 2, 33/-; tube 11/-, 26 x 2 1/2, 35/-; tube, 11/-, London Agents for Continental Tyres. Continental combination rubber and steel-studded, 26 x 2 1/2 81/3, 26 x 3 110/-. Rom combinations, rubber and steel studded non-skids, 26 x 2, £2 12s. 26 x 2 1/2, £2 15s. 26 x 2 1/2, £2 17s. 6d.

THE HUNT

EXHAUST WHISTLE.

A splendid road clearer. Operated by the foot.

Easily fitted.

Fits on exhaust pipe. Effective on one or more cylinders.

Price 5/6, postage 3d.

The Auxiliary Air Inlet.

Fits on inlet pipe. Gives a wider range of mixture. Useful on a hot day. Price 3/6 Postage 2d.

The Hunt North Road Overalls, suitable for wearing with the above coat.

These meet a long-felt want. They can be instantly slipped on over the ordinary trousers. They fasten round waist with a leather strap and buckle. Being made in one piece, they are a great protection to the stomach, also it is impossible for the rain to drive in as with the ordinary overalls. Made in three lengths—short, medium, and long. Shaped to go over boot. Patent side fasteners.

Manufactured of Double Texture Paramatta, thoroughly waterproof.

PRICE, quality No. 1. 24/- per pair.

" " " 2. 16/6 "

" " " 3. 13/6 "

THE HUNT DRIP FEED LUBRICATOR.

For inserting in existing oil pipe. Adjustable to any number of drips. Oil can be forced through by pump if desired.

Price (plated) 5/6, postage 3d.

The Hunt Valve Spring Remover.

By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free

Price, 2/6 post free.

THE "HUNT" REGD. COAT.

This coat is essentially a storm one. From the collar, where the opening is started under a watertight pocket, to the bottom the fastening is cut on a curve, so as to fall perpendicularly and down the side of the wearer when riding. This excludes the severest head storm, and gives the user a coat the equal of the sleeved poncho without its disadvantages. Pockets are placed not on the hips, where but little can be carried, and with inconvenience, but on the chest. The large one is pleated, and takes Bartholomew's 3-in. scale motor map, and has a small cash pocket within. On the other side is a smaller pocket, suitable for a "vest" screw-hammer and minor tools. The contest and trials rider will find this coat a boon, for by means of the push buttons used it can be fastened and adjusted while riding, notwithstanding the thickest gloves being worn.

Manufactured of Double Texture Paramatta, thoroughly waterproof, fitted with collar, wind and rainproof sleeves, ventilated under arms. Best guaranteed proofing. Length 26in. Stocked to fit chest 40in., 42in., 44in. (outside measurement).

PRICE, quality No. 1, 40/- Quality No. 2, 25/-.

BRADBURY MOTOR CYCLES.

Bradbury 3 1/2 H.P.

Immediate delivery. Price £48.
With two speed and free engine, £55.

LONDON AGENTS
FOR
MILLS AND FULFORD
SIDECARS.

A full range of 1911 Models now on view, stocked to fit all makes of machines. Immediate delivery.
Prices from £6 6s. 0d.

THE HUNT RELLESEN DRY CELL.

No corroding terminals. No acid. No charging. Always ready, clean, and dry. The "Flash." Height 6 1/2 x 4 x 2 1/2 in. Approx. mileage, with single-cylinder engine, 1500. Price 6/6. The "Flight" ditto. Height 5 1/2 x 5 1/2 x 2 1/2 in. Price 6/6. The "Midget" emergency ditto. Height 5 1/2 x 4 1/2 x 1 1/2 in. Will run approx. 300 miles. Price 4/4. Postage 6d. extra.

THE COWEY SPEED INDICATOR AND MILEAGE RECORDER (Guaranteed).

Registers a speed up to 60 miles per hour. Mileage recorder registers up to 10000 miles, then automatically starts again. The indicator can be easily attached by any motorist, and once fitted requires no attention or adjustment whatever. It will continue to render good service as long as it is attached to the cycle, for it is constructed throughout of the best and most suitable materials by expert British mechanics at Kew Gardens.

Price, in Nickel, 84/-, carriage paid.

THE "ACME" WATCH AND CASE.

These Watches are constructed to stand vibration. Each watch guaranteed for twelve months. To clip on handle-bar. Very neat. Made in Aluminium. Complete with Ingersoll Watch.

Price 8/6, postage 2d.
Case only, 3/6.

The "Hunt" ALL Metal Switch.

The design of this Switch is so extremely simple that there is nothing in it to get out of order; the contact is quick and definite for both make and breaks. The whole of the switch is made out of heavy sheet brass well finished and nickel-plated, the terminals insulated with extra large ebonite washers and the fixing clip is attached by a bolt and a nut passing through the sides of the metal case, thus ensuring a reliable attachment to the handle-bar.

Price. One Way, 2/3. Two Way, 2/9. Postage 1d.

Illustrated Catalogue sent gratis and post free.

In answering this advertisement it is desirable to mention "The Motor Cycle."

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A New Zealander's Views on a Knotty Question.

[5854].—Probably by the time this reaches you all interest in the subject of which wheel of a sidecar combination lifts will have been dropped. However, I think I have solved the question, at least to my own satisfaction. Driving a Montgomery No. 5 castor wheel sidecar with a light passenger and car fitted on the left side, I took a right-hand corner a great deal faster than I ought. The corner is sharp, a good deal sharper than a right angle. I felt the outfit tilt in a rather curious way, and as I had to stop a few yards further on, I went back to look at the tracks. There had been recent rains and the tracks were quite clear and not at all obscured by other tracks. The sidecar wheel had not left the ground at all, nor had the rear wheel of the bicycle, but the front had lifted for 12ft. H 075.

The Advantage of Advertising Prices.

[5855].—May I have a grumble? Some little while ago I wrote to the Co. for a new mudguard for my sidecar, also asking them for a price list of spares, and I had a curt reply to the effect that they only dealt through agents.

This market is only now opening out for motor cycles, so is, I suppose, not worth any attention from the makers, hence their letter.

It might interest you to know that two years ago there were not more than five motor cycles in British East Africa. Within the last six months something like another fifteen have been added, and a good many more are on order. Triumphs and F.N.'s so far hold the market. Of course, this is very small, but so is the place.

Nairobi, British East Africa.

S. T. LYDFORD.

Businesslike Methods.

[5856].—Will you allow me to give readers of your instructive a diary of a "business" transaction, not yet completed?

On June 24th, 1910, I wrote to a sidecar manufacturing firm in the Midlands to ask for a quotation for alterations to a sidecar frame of their own make in my possession.

On June 28th I got their quotation, and that the job could be done in fourteen days.

On July 7th, 1910, the firm acknowledged receipt of sidecar, quotations having been accepted by me.

On July 20th, 1910, the firm wrote saying spring wheel parts had not been delivered from Chater Lea.

On July 26th, 1910, Chater Lea wrote me saying that no order had been given by the firm, only enquiry made.

From that time until September 8th, 1910, I waited. Then, in reply to a note of mine, I was told the firm had again written to Chater Lea.

I now got rather worried over the high speed of the business, and asked the firm to fit their own spring wheel, and on September 19th, 1910, they wrote and said the job had been put in hand.

I felt mildly pleased that we were moving, if ever so slowly. However, my joy was short-lived. Christmas came, so did the New Year, but no sidecar. So another attempt at a start was made, and on January 6th, 1911, I sent a registered letter, as ordinary letters seemed to go astray in the post, for replies were not received.

This mild remonstrance of mine brought a reply on January 8th, 1911, full of various excuses, and proposing I should take a complete new stock frame of their own at a revised quotation. This estimate I accepted, provided delivery was made in one week.

On January 11th, 1911, I received a reply: "We beg to acknowledge your esteemed order as below, and same shall have our very best attention." From then till now silence has reigned. I begin to think the article I sent the firm could not have been mine at all, though I did originally buy it from them and paid hard coin of the realm for it.

Mr. Editor, what would you do now? Or will readers advise? ONLY A MEDICO.

Tandem Geared Engines.

[5857].—I note in your last issue a description of a multi-cylinder engine having separately geared crankshafts. Herewith I send you an old specification of mine, which illustrates, describes, and claims an engine somewhat similar to the one you illustrated. You will note there are two adaptations of this engine—one for a heavy tricar engine—one for a heavy tricar

CHAS. Y. HOPKINS.

The Mont Cenis Hill-climb.

[5858].—Why do not our manufacturers compete in the Mont Cenis hill-climb? As an interested spectator in the recent contest on this famous pass on August 13th, I should like to say that a more difficult test for motor cycles would be hard to find. The hairpin bends are terrible, and the course is a long one. Three teams of Italian makes, besides several French machines and one English machine, competed, and an Italian machine called the S.I.A.M.T. carried everything before it. Their new 500 c.c. twin, ridden by Riva, the holder of the record of 1905 on a 12-14 h.p. Peugeot, actually beat his own record, and made an average speed of over 60 kiloms. (37½ miles) per hour in this climb of 6,000 feet in 23 kiloms. (or 14½ miles). I think there are ten or eleven real hairpin bends on this small pimple, and only 1½ kiloms. of anything like straight road. It was interesting to watch the competitors, including the winner, on their single-geared machines, jam on their brakes, jump off at the hairpins, and run, with their engines still firing, round the corners—a gymnastic feat which is necessary owing to the sharpness of the turns. It may be also interesting to note that the S.I.A.M.T. won every class, and that the 290 c.c. single-cylinder averaged 34½ m.p.h. for the climb.

An exhibition being held in Turin, and several magnificent exhibits of British machines being shown, it was very disappointing to us to find that only one of our most famous makes competed, although it was said that two of their special racing models arrived too late for the contest.

Let us hope to see quite a number of English machines make a show next year, as motor cycling is fast becoming a favourite pastime in Italy, and, as shown by the marvellous times on the hill-climb this year, the Italian machines have apparently exceptionally efficient engines. [We published the times in our last issue; see page 917.—Ed.]

Perhaps it will be remembered that the famous Nazzaro on a 140 h.p. F.I.A.T. took only 19m. (record) for this climb.

No doubt in the near future you will have the S.I.A.M.T. machines in England, as I hear that an English firm has secured the agency for this handy little lightweight motor cycle. I do hope to see a few of our manufacturers enter next year in such a fine contest as the Mont Cenis hill-climb.

Turin.

CYRIL A. SNIPE.

Road Hogging.

[5859.]-Re E. C. Morris's letter in issue of August 24th on road hogs. I experienced a few days ago a most unpleasant sensation while riding over the Hog's Back towards Farnham.

I noticed a car coming towards me, about a mile away, at a very rapid pace, and when the distance got to about 200 yards, a second car shot out from behind and got alongside the front car. The pace was terrific and neither seemed to give way; they came along neck and neck with not a foot of the road to spare. I feel, had I left it a moment later to dash at the bank, which at this point was about eight inches high, I must have been killed instantly; as it was I came off the machine and seemed to turn four or five somersaults while the machine was on the grass bank a few yards away. When I had collected my wits again, the cars were specks in the distance. I, fortunately, escaped with a scratch or two, but the machine seemed all doubled up. On examination the back carrier was twisted all out of shape, lamp and controls were smashed, and several other minor damages. You will imagine my feelings to be run off the road in this dastardly manner, while on the other hand not a soul was near to witness this to enable me to benefit by my insurance policy. C. H. COOK.

Change-speed Gears and Sidecars.

[5860.]-I have read with interest the several letters written on the above subject, but do not think that anyone has mentioned the very excellent N.S.U. two-speed gear. I have had for the last two years a 6 h.p. twin N.S.U. fitted with this gear, which has not given me a moment's trouble, and has only needed one operating roller renewing, which can be done in one minute without removing the gear. The low gear clutch will start the machine and sidecar with 22 stones and luggage comfortably on hills of 1 in 15 or so, and will do so on 1 in 10 if the driver walk alongside while putting in the clutch until the machine has got a bit of "way" on it, and he can then step on board. I have used my present machine for three holiday tours to Land's End and back via the coasts of North and South Wales, Derbyshire, South Dorset, and Devon, and it has never failed on any hill, and my single trouble has been one broken inlet valve.

Engine averages sixty to eighty miles to the gallon. The sidecar tyre is in its third year, and the ribs are still on the tread. The front cover has just been replaced because it was worn through to the canvas. The present is the second back tyre, and will probably finish out the season. The section is 2½ in. on bicycle and 2¼ in. on sidecar.

AX 37.

The Life of Tyres.

[5861.]-I have often seen complaints in your correspondence columns about the life of tyres, particularly from those who drive high-powered machines either solo or with sidecar. My own experience may interest you.

I bought a 650 by 65 mm. grooved Dunlop last summer for £3 5s., when the price of rubber was at its highest. I put the tyre on the back wheel of my 8 h.p. Bat driven solo throughout, and it stayed there for 4,280 miles, the first puncture occurring just before 3,000 miles. I had the tyre retreaded and rehbed by the Dunlop Co. and put it on the back wheel of my new 8 h.p. Bat at Easter. It is now worn down to the canvas, but has completed 2,735 miles all on the back wheel, of which 1,655 miles have been with sidecar. The tyre has thus a mileage of 7,015 on the back wheel of an 8 h.p. twin to its credit.

I have driven fast over Lancashire and Yorkshire roads, the Devonshire hills and Lake District passes, and though there is no doubt that the spring frame on my machine adds greatly to the life of tyres, yet this does not lessen the credit which I think is due to the makers. The wonderful wear of tyres on my machine enables me to run it at a less cost than a 3½ h.p.

If those who complain about their tyres and tyre troubles would only fit accessories which are suitable to the power of their machines and the work they have to do, we should hear less of them. G. ARTHUR GREGSON.

P.S.—I have no interest in either tyre or machine beyond a purely personal one.

Variable Gears in Hill-climbs.

[5862.]-I am obliged to you for inserting my letter on the subject of variable gears in hill-climbs, but I think that your editorial note apparently discredited my complaint.

I would now like to answer your note with a view to showing that the complaint is real.

First of all, the original programme only included six events, and then (I understand to meet our objections) another class was added. This seventh class is open to any machine without restriction, so that any freak machine of any weight, and whether stripped for racing or not, can complete. This does not, in my opinion, meet the objection.

When you say that out of seven classes variable gear machines are eligible for four, you are including this seventh class and also the class for ladies, which with the lightweight class and the variable gear class make up the four.

There is no doubt that the public are more concerned with the classes for 3½ h.p. machines, and of these classes there are two—one for touring machines and the other for T.T. machines, and Zenith-Gradua machines are barred from both these classes.

The only classes in which an ordinary variable gear machine can compete are the variable gear class, in which singles and twins are lumped together, and the new class No. 7 in which any freak can run.

I think you must, therefore, agree with me that your editorial note, though quite correct in fact, gives a totally wrong impression, and an impression which could only be removed by careful analysis of the programme.

The significant fact to my mind is that whilst single-gear singles and single-gear twins have separate classes, the variably geared singles and twins are thrown together in one class, despite the fact that the variably-gear machine is more largely used for trials than the single gear machine.

Bear in mind that the single-gear 3½ h.p. singles and the single-gear twins get three classes exclusively to themselves, whilst the variably-gear 3½ h.p. and twins get one class only, excluding the classes for lightweights, ladies, and freaks.

W. G. BOWER.

Managing Director Zenith Motors Ltd.

[In arranging the classes those receiving the least support last year were deleted by the Coventry and Warwickshire Motor Club. We should like to point out to Mr. Bower that there were only seven variably-gear single and twin-cylinder machines in class 6, so that separate classes would not have filled. There were twenty-four and thirty-three single geared machines respectively in classes 1 and 5.—Ed.]

Miss May Walker and her three-speed Handy Hobart of which she is a delighted owner. Miss Walker was a competitor in the Coventry & Warwickshire M.C. Hill-climb last Saturday.

A CUSTOMER WRITES—

"... I purchased a 1½ h.p. machine, second-hand, from the Service Co. (no connection other than satisfied user), and these people have laid themselves out to give me ever satisfaction, and most courteously, too; yet it was only an accumulator machine, and of low price."

CLINCHER

DREADNOUGHT MOTOR CYCLE TYRES

Should be fitted to machines which are in continual use over all sorts of roads, and in every kind of weather. The rubber studded tread is designed to take advantage of any projection or inequality of the road surface, and thus gives the highest non-skid efficiency possible. The studs wear down evenly and (owing to the thickness of the tread) after they are entirely gone, the cover is as good as an ordinary round tread. Tyre upkeep is the bugbear of the Motor Cyclist.

MANFG. CO., ———
PENGE, LONDON,
S.E. ———**

LOST NO MARKS

That's the way to emerge from the Six Days' Trials—without the loss of a single mark. That is what Mr. S. T. Tessier accomplished on his 5 h.p. **BAT** thus proving absolute reliability and constructional perfection. Mr. E. Babington a private owner lost only 7 marks throughout the whole 1,000 miles. You cannot do better than invest in a British built Bat with Bat Spring Frame, Bat Spring Forks, Protected Magneto in Tank, Automatic Lubrication, and many other exclusive feature.

REMEMBER—the Bat created another Class Record at Brooklands on August 26th in the B.M.C.R.C. Speed Trials.

3½-4 h.p., £48 10s.
5-6 h.p., £58.
7-8 h.p., £60.

Continental Touring.

[5863.]—In your last issue the Car Supply Co. say, "We notice Mr. Fawcett complains that he was charged £1 for his motor cycle when crossing from Folkestone to Boulogne." Will the Car Supply Co. please read my letter again, and they will see I said for my machine and Mr. Grange's, a totally different thing. W. FAWCETT.

Motor Cycle Insurance.

[5864.]—With reference to my previous letters on the above subject and Mr. A. H. Priestley's reply [No. 5666, 5703, and 5720], I now beg to say that as a result of Mr. Priestley's intervention, the Insurance Co. have admitted my claim, and sent me a cheque for the full amount. I may say that my first letter was not intended as a "grumble," as I considered the argument perfectly logical, but as a warning to others, who, like myself, might err unthinkingly. ADSUM.

[5865.]—Your correspondent in the last issue raises a point of vital importance to motor cyclists who use their machines partly or chiefly for business purposes, say, commercial travellers, doctors, etc.

I gather that doctors get their motor cycles insured at the "pleasure" rate without question, and as they have to be out at all hours of the day and night, and in any weather, and are often called to urgent cases, they can hardly be considered a good risk. At any rate, the commercial traveller, who is more concerned to get along steadily and reliably than to "scorch," and who prefers to get his business over during regular business hours; in fact, *has* to do, would seem to be a much better risk.

Yet, in half a dozen proposal forms, I find similar restrictions. The A.A. and M.U. and a Lloyd's form specify "private pleasure purposes," the A.C.U. and the Car and General say "private purposes," and only the C.T.C. thinks of "combined pleasure and business." TRAVELLER.

Hill-climbs—A Suggestion.

[5866.]—When the competitors do not all ride, one cannot be sure whether the last man in any class has ascended the hill. It is even more uncertain when post entries have been accepted and not printed on the programme.

This uncertainty entails some risk to spectators when, say, a lightweight class is followed by an open class, and a clear road is needed for fast machines.

It is suggested that the last man in each class should wear a red sash handed to him by the starting marshal. Then all would know the class was completed. OLDHAM.

Broken Piston Rings.

[5867.]—I thought I should like to mention that I have had a similar experience with a broken piston ring. On coming up a very slight hill one night my machine (running well at the time) started a most weird knocking and pulled up in a few yards. On trying to start again it fired as though blowing past rings, but finally picked up well enough to take me home. When I had the cylinder down I also found that the small overlapping piece on the underside of ring was missing, and there were no traces of it, cylinder as bright and polished as when new. I am sure that the piece did not go in crank case, as that has been taken down to fit new bushes which I found was the cause of the trouble that I asked you about some time ago.

MORTIMER W. LARKIN.

The Six Days' Trials.

[5868.]—I was surprised to see in the list of private owners competing in the A.C.U. 1,000 miles trials a person who works daily at the trade at a dealer's shop, and who did not own the machine used in the trials. This extract is from a newspaper published where he lives.

"A notable triumph has been achieved by Mr. —, head engineer to —, of the — cycle and motor works, on one of the famous — motor cycles. With his usual enterprise, — who has always had full confidence in the —, decided to be represented in the A.C.U. Motor Cycle Reliability Trials. Riding a — taken out of the — works, — rode 1,100 miles and covered the steepest hills in Yorkshire, Wass Bank, Sutton Bank, Blue Bank, Whitby, and Garrowby. Mr. — not only made a clean ascent of all the hills, but out-distanced many of the professional riders who were representing some of the biggest firms in the trade.

He was awarded full marks and a gold medal for his fine performance, which also enhanced the reputation of the — machine locally and nationally."

As this rider figures amongst the six from which the best amateur performer was selected, a decided injustice would have been done to any genuine private owner had it been awarded to him.

Surely it is time the A.C.U. made some enquiry into the status of some of the so-called private owners.

PLAY THE GAME FAIR.

[The A.C.U. inform us they do make enquiries.—ED.]

Shall I Buy a Motor Cycle?

[5869.]—On reading last week's issue of your paper, I came across the article by "Pedal Cyclist."

I was considerably interested in it, as I have a friend who was in a similar predicament. However, he took the hazardous step, and invested in a well-known make of lightweight twin.

I may say, without any discourtesy to my friend, that his knowledge of petrol engines is a minus quantity; and the reason why the thing should go at all, so far as he is concerned, is an addition to the seven wonders of the world.

I took upon myself the arduous duty of instructing him how to start the machine, lubricate, and control it.

I am glad to say he more or less digested this, but when I gave him a general description of the mechanism, he looked nonplussed; it had all gone out the other ear.

However, he now makes journeys of a considerable length with great success. Punctures he cannot mend. He has them done where he can, but engine trouble has practically been non-existent.

I undertake the cleaning of the plugs and carburetter periodically. He finds the gardener competent enough to keep the machine clean externally.

He has now ridden for some nine months, and I may say he derives a considerable amount of pleasure from the pastime, as he has often told me, though ignorant of the mechanism of his power unit.

If "Pedal Cyclist" took the rash step, I feel sure that curiosity and a little experience would produce the required knowledge in time. J. E. M.

Will O. J. Taylor, who gave the address G.P.O., Carlisle and lent a spanner to a motor cyclist between Kirkham and Blackpool, kindly communicate with Arthur Martin, c.c. the Editor? A communication addressed to him has been returned marked "Not called for."

ANCIENT AND MODERN.

Harry Long on an old boneshaker with his Triumph alongside. Mr. Long had completed 30,000 miles when this photograph was taken. (See page 927.)

THE NEWNHAM HILL-CLIMB.

Competitors' mounts ranged in order on Newnham Green. A space was allotted to each class, so that riders knew exactly where to place their machines. The excellence of much of the local organisation is due to the efforts of a Davenport member, Mr. Hubert Reynolds.

UNDER the above title the Coventry and Warwickshire M.C. open hill-climb may not be recognised except by competitors, officials, and the actual spectators, so well had the secret been kept. Newnham hill was selected by the Coventry Club committee last week, although permission had also been obtained to use Willersey Hill, the steeper gradient used last year, but which was ruled out on account of its dangerous nature, the bad corner and rough surface not being suitable for fast speeds.

The selection of Newnham proved a popular one, though it certainly would have been better if the gradient had been more severe.

The surface was in very fair condition generally, but the corners were just gradual enough to necessitate extreme caution at speed. A record entry for the club was again the result, the entries numbering 120 with the teams.

Preliminary Operations.

The weighing was carried out in the morning on Newnham village green, the machines being subsequently examined by the scrutineer, Mr. B. H. Davies, only one touring machine being prevented from starting, as it had dropped handle-bars in contravention of the rules.

After being passed by the examiner, the machines were ranged in thoroughly business-like order alongside pegs bearing numbers, and the big assembly of machines glittering in the sunlight was indeed a sight to behold.

The horse-power was calculated on the Coventry and Warwickshire Motor Club's formula, which is—

$$\text{H.P.} = \frac{D^2 \times \sqrt{S} \times N}{18,000}$$

$$\text{H.P.} \times T$$

and the formula was :

W

Where T = time in seconds, W = weight in lbs., D = bore in mm., S = stroke in mm., and N = number of cylinders.

The lowest figure of merit denoted the winner.

A start was made soon after 1 p.m. in glorious sunny weather. There were few spectators at this stage, owing to the early start, so that the task of the boy scouts and marshals was a comparatively easy one.

Single-cylinder Touring Machines.

There were twenty-four competitors in Class 1 for single-gear, single-cylinder touring machines up to 500 c.c., S. Russell Cooke (Rudge) leading off the ball. The Ivy-Precision team created a great impression, as also N. Ayres and his 3½ h.p. Singer, and Geoffrey Smith, whose new model 2½ h.p. Singer romped up the hill, putting to shame many a 3½ h.p. machine. E. A. Burney was a non-starter, owing to a cracked cylinder, and W. F. Newsome withdrew.

The results on time and formula are as under. In cases where position numbers are alike it indicates that the riders tied :

CLASS 1. Single-gear single-cylinder touring motor cycles, with engines not exceeding 500 cubic centimetres capacity.—First on formula, the President's cup. Second on formula, club prize. First on time, Triumph gold medal. Second on time, club prize.

S. C. Perryman, 3½ Ariel	1	85×85	14	19
F. P. Davies, 3½ Rudge	1	85×88	15	20

In Class 2, for lightweights, there were only six entries, Roy Walker (New Hudson) winning on formula, although his stand dropped down during the ascent, and slowed him somewhat. R. H. Viggers (Enfield) was fastest.

Class 3, for T.T. machines, attracted thirty-four entries, and some splendid speeds were witnessed, the machines hardly slowing a tick on the last stretch of 1 in 6. The belt on Stanhope Spencer's Rudge was apparently slipping. H. Goodwin (4 h.p. Blumfield) slowed almost on the finishing line, owing to the air control wire coming adrift. He passed the post and was timed, but, of course, he was out of it. Singularly enough, the next man "A. Gee" (3½ h.p. Precision), whose belt had become smothered with oil, repeated the performance. He succeeded in passing the line, but only on foot. W. Croyton (3½ h.p. Triumph) unfortunately fell at the

Coventry and Warwickshire M.C. hill-climb. Weighing competitors and their machines on Newnham Green. The lady on the scales is Miss Baxter with her 3½ h.p. Rex.

cross roads, and was lucky to get off with but a few skin abrasions. Creyton and other Triumph trade riders always wear leather suits, a wise precaution in these events. Woollen clothing in Creyton's case would have meant serious flesh wounds. W. F. Newsome (Triumph) rode splendidly in making fastest time. Results of Classes 2 and 3:

CLASS 2. Lightweight motor cycles in touring trim. Single-cylinders up to 300 c.c. Multi-cylinders up to 340 c.c. Fixed or variable gears.—First on formula, club prize. First on time. Britannia Foundry Co.'s gold medal.

*Allan Hill made fastest time but, as he failed to stop between the strips, the prize was awarded to C. T. Newsome.

L. B. Hart-Davis (scoutmaster) stopping a competitor between the strips in the variable gear class. The scouts rendered yeoman service in keeping the course.

The Newnham Hill-climb.—

As was expected, Miss Hind made fastest time in the ladies' class, riding her usual mount, a 5 h.p. Rex. Mrs. Simpson, 3½ h.p. Rudge, was first on formula. Unfortunately, our pictorial artist did not secure a good photograph of this lady.

The All Comers' Class.

Naturally the most excitement was in Class 7 open to all classes of motor cycles, no restrictions being made. O. C. Godfrey's failure to put in an appearance with his 7 h.p. Indian caused some disappointment, as the duel between him and the Coventry Club speed amateur A. Mackenzie Cott was expected to provide a close race. As it was Cott made the fastest ascent of the day on his 8 h.p. J.A.P., to which he had fitted a C.A.P. carburetter with wonderful results, though W. F. Newsome on his T.T. Triumph was less than a second slower. On formula G. Smith (*The Motor Cycle*), riding the touring 2½ h.p. Singer, was again successful, despite the fact that his magneto machine came adrift and had to be held on to its platform by means of straps. It is worthy of mention that this is the thirtieth different machine Mr. Smith has ridden this year. Roy Walker, on an overhead valve New Hudson-Jap, was second on formula. The leading positions will be found hereunder:

All the events had been run off by 3.45 p.m., greatly due to the efforts of chief marshal Holroyd and his staff of helpers. Further, the results were posted in Daventry before 5 p.m., thanks to the energy of the results calculators, Messrs. J. W. Roebuck, Wh. Ex., J. L. Milligan, B.Sc., and C. B. Waterlow, B.Sc. The official awards on formula in Class 1 were withheld on Saturday evening, as G. Smith's 2½ h.p. Singer on which he won had a 2in. tyre on the front wheel and a 1½in. on the rear wheel, thus giving the impression that the smaller tyre was not standard. As soon as the makers produced their printed list showing that 1½in. tyres are the standard equipment, the results were passed by the committee.

Coventry being the seat of the motor cycle industry it is not surprising that the industry was more strongly represented than is usual at motor cycle competitions, the leading lights in the trade from Coventry, Birmingham and district, being either lookers-on, officiale, or competitors.

W. F. Newsome rushes for the cross roads at full speed on his 3½ h.p. Triumph. Newsome only just missed fastest time of the day by fractions of a second.

The Newnham Hill-climb.—

CLASS 7. All-comers'. No restrictions as to equipment of machine.—First on formula, Rudge-Whitworth cup. Second on formula, club prize. First on time, the club cup. Second on time, club prize.

Rider, H.P. and Machine.	Cyl.	Bore and Stroke.	Position.	
			On Time.	On Formula.

S. Crawley, 3½ Triumph	1	85 × 88	23	17
F. P. Davies, 3½ Rudge	1	85 × 88	24	19

Other Prizes.

The *Midland Daily Telegraph* prize was awarded to A. Mackenzie Cott for the fastest ascent of the day.

SPECIAL COVENTRY CLUB MEMBERS' PRIZES.—Club prizes for the best performance on formula by a member who has not won a prize in a hill-climb were awarded as follows: In Classes 3 and 7 to A. B. Jepson (3½ h.p. Triumph) and C. S. Burney (3½ h.p. Rudge). The special team prize was won by the K.N. team: J. Gibson (3½ h.p. Rudge), Geoff. Smith

C. T. Newsome who, riding a 3½ h.p. Rover with Armstrong three-speed gear, won the variable gear class both on time and formula. In the photograph he is seen restarting between the strips.

(2½ h.p. Singer), and Roy Walker (2½ h.p. New Hudson). With regard to the placing on formula it should be noted that A. Mackenzie Cott would have had to ascend the hill at something like 80 m.p.h. to have beaten Geoff. Smith, supposing the latter's pace to have been about 25 m.p.h. Obviously an impossible performance. This points to the need of a new formula. While the present formula is in use, if the h.p. is double for a given weight of machine and rider the speed must also be doubled. This is, of course, quite out of the question, for air resistance alone increases as the square of the speed. For this reason it is probable that the formula suggested in our correspondence columns a few weeks ago would give better results. This formula is

$$W$$

$$C \times T^2$$

A fast climb was made by S. T. Tessier on a 4 h.p. Bat-Jap in Class 3 when he ran second to W. F. Newsome, but he was not quite fast enough to get level with the Triumph crack.

THE TRIUMPH TWO-SPEED GEAR.

FOR some months past we have known that the Triumph Cycle Co., Ltd., Coventry, were experimenting with a two-speed countershaft gear fitted in a box behind the usual pedal bracket, but at the special request of the makers we refrained from mentioning it in these pages. However, as a contemporary has seen fit to publish a photograph and description of the gear our hands are no longer tied, and we now have pleasure in reproducing a line sketch showing the external arrangement of the drive and the gear

The Triumph experimental countershaft two-speed gear with combined chain and belt transmission. It is not yet ready for the market.

box, and append a technical description of the gear. It is, however, advisable to point out that the Triumph Cycle Co. are not in any way prepared to deliver this gear, and only last Saturday, in conversation with their works manager, Mr. Hathaway, we were informed that the final design was not yet decided upon, and that before the gear was offered to the public there would doubtless be some alterations.

SCORCHING.

AS Mr. Hugh Gibson and Mr. Hart-Davies have been taking my name in vain somewhat freely of late, I am asking the Editor's permission to reply, especially as I am charged with inconsistency. I was unaware my name had ever appeared at the foot of an article condemning End-to-end record breaking, but possibly these gentlemen are correct, and my position needs explanation.

Let me say at once quite frankly that I see nothing dangerous in averaging thirty miles an hour over the majority of our good roads, that I should welcome the extension of the speed limit to 30 m.p.h. if we are to be permanently afflicted with a speed limit, and that like 999 out of every 1,000 motorists I not infrequently drive at speeds in excess of legal limit.

These opinions are perfectly compatible with the strongest condemnation of the End-to-end record rides. It is one thing for a solitary rider to average thirty miles an hour over a broad, straight road for a short distance, up to 250 miles or so. He selects this pace because he regards it as safe under the circumstances, and because he enjoys it. If grease or corners or traffic or a change in the character of the road suggest that he should slow down to 10, 15, or 20 m.p.h., he generally does slow down. Anybody who saw me passing through a village, or approaching a hidden corner on one of my worst "blinds," would take me for the tamest rider on earth.

The circumstances of an End-to-end record are as different as chalk from cheese, and this is just what the outlaws refuse to recognise. A combination of forces urge the record breaker to snatch every available second. He has devoted his annual holiday to the attempt, he has possibly laid out a sum of money on the affair, he knows he can only succeed by a very small margin, and when danger looms ahead, all these influences combine to make him take risks. The odds are 100 to 1 against his slowing down when he ought to, whereas commonsense has free play with the fast tourist.

The chief features of the gear are that starting can be effected on either high or low speed without the use of a separate clutch, and that the chain connecting the gearing to the engine can be easily adjusted. The gear mechanism comprises a small gear box with two shafts passing through it, one of the shafts carrying two expanding clutches, somewhat of the type used on the earlier De Dion cars. By expanding either clutch, starting can be effected on the corresponding gear, the higher of which is direct, whilst in the lower the power passes through the gearing, giving a reduction of speed. The expansion of the clutches is effected by means of a rod sliding through one of the shafts, and actuated by means of a link from a double-ended pedal. When the pedal is in one position, both clutches are out of engagement; when one end of the pedal is depressed, one gear is engaged; whilst to change speed the other end of the pedal is depressed, bringing the first clutch into the neutral position and engaging the second. There is thus no sliding of gear wheels or engaging of positive clutches, and consequently starting can be effected gradually and easily on either gear—which is a very important point, as it obviates the necessity for employing any external starting clutch or "free engine."

One of the gear box shafts can be fitted with a starting handle if desired, enabling the engine to be started with the machine stationary. As will be gathered, the engine transmits the power to the gear box by means of a chain, and, as can be seen in the illustration, the motion is transmitted from the gear box to the back wheel by means of a belt. The method adopted for providing simple means of adjustment of the chain is very clever.

The exterior of the gear box is made circular, and it is carried in a circular bracket or housing, which forms part of the main frame. The centre of the chain sprocket is eccentric to the centre of the gear casing, so that if the casing is rotated the chain sprocket is moved nearer to or further away from the corresponding sprocket on the engine-shaft. Thus the chain is adjusted by merely rotating the gear box slightly, whilst it is held firmly in place by means of a simple form of clamp carried by the gear box housing. This type of gear should be almost fool-proof.

By B. H. Davies.

We have to add to this the fact that only one record breaker in twenty is wholly *compos mentis* over the concluding stages of the classic route. Averaging thirty miles an hour for two stages of 100 miles apiece between meals is a very different thing from averaging thirty-five miles an hour including stops for nearly 900 miles; there is a certain intoxication which results from prolonged compulsory speed, combined with a degree of physical exhaustion, or at least abnormal physical conditions.

I have more than once seen a record breaker "blind" through a small and tortuous village, preceded by his "pilot" and rear-guarded by his "followers," the whole crowd roaring along at nearly 40 m.p.h. with their cut-outs open, and their hooters tooting madly, and each man in the team excited, or, as I put it above, in an abnormal physical and emotional condition. They do not shrink from risks like the fast tourist; they rather trust to luck and to superb steering to override risks. Surely there is some justification of the A.C.U. attitude in these considerations.

I need hardly say I am completely at one with Messrs. Gibson and Hart-Davies in desiring to see "blinding" eliminated from the English and Scottish Six Days. I do not think either trial has produced much reckless driving, though the desire to save marks now and then has just the same effect as the desire to smash a record, but if the "scorching" is not undertaken to save marks, it is not essential to the trial; and if it is done to save marks, it implies unpenalised trouble, and is therefore a defect.

Moreover, the fast riding of large clumps of riders may render motor cycles unpopular, and add to prejudice. I sincerely hope, therefore, that in the 1912 trial there will be two surprise checks per diem, and that the present 20 m.p.h. average, which is a wild farce, will be strictly enforced. But I repeat there is not the least danger in a sensible driver averaging 30 m.p.h. for short distances over suitable roads.

**Scottish Motorists' Protest.**

Motorists in the North are grumbling very much about the state of the roads, sign-posting, etc., on the main Deeside Road, which passes Balmoral Castle and leads to the Devil's Elbow. The correspondence in *The Aberdeen Daily Journal* is both long and loud.

Provincial Motor Cycle Shows.

It is probable there will be no local or provincial show of motor cycles this year. Manufacturers and others who are members of the Manufacturers' Union are bound under heavy penalties not to show at any other than the society's exhibitions in Great Britain.

The A.C.U. Club Championship.

The team chosen to represent the Coventry and Warwickshire M.C. in the A.C.U. Club championship is made up as follows: Alan Hill (3½ h.p. Rudge N.S.U. gear), S. Wright (2½ h.p. twin Humber), Geoffrey Smith (3½ h.p. Triumph), E. A. Gorton (7 h.p. twin Rex), C. S. Burney (3½ h.p. Rudge), and A. Elson (3½ h.p. Triumph).

Hill-climb at Ballymacroe.

The Dublin and District M.C.C. held its concluding hill-climbing competition of the season on Saturday last, when a prize presented by one of the members, Mr. J. Healy, was competed for. The hill selected for the competition was at Ballymacroe, near Ashford, Co. Wicklow, a very steep hill leading from the coastline to the watershed of the Vartry, some parts of which have a gradient of 1 in 6. The afternoon was favourable for the competition, but the surface of the hill was in a very loose condition, and consequently the times were not so fast as was expected. The competition was decided on a rather unusual plan, the men being sent off in pairs, and the winners of each heat met in the second round, and so on until only two were left in. The heat winners of the first round were: P. J. Brady (3½ h.p. Rudge), 15 secs. start; T. Green (4 h.p. Waverley), 12 secs. start; G. Tyson (3½ h.p. Rudge), 15 secs. start; C. B. Franklin (7 h.p. Indian), scratch; F. J. Walker (8 h.p. J.A.P.), 5 secs. The second round resulted as follows: T. Green beat G. Tyson, F. J. Walker beat C. B. Franklin, and P. J. Brady beat J. Healy (a bye). The latter went into the semi-final round as fastest loser, but was beaten by Walker, and P. J. Brady beat T. Green. The final lay between Walker and Brady, and the first-named won. The distance was 1,144 yards.

Our Colonial Issue.

The above special issue, which will be published on October 12th, will contain among other interesting features the following articles: A list of colonial and foreign customs, tariffs and freight charges compiled from information obtained from shippers and the consulates. The Colonial Mount: Advantages of a Change-speed Gear for the Colonies, etc., by B. H. Davies. Our Export Trade: A chart showing the rapid rise of the British motor cycle exports. Experiences and opinions from Overseas Readers of *The Motor Cycle*. My Ideal Specification, by Expert Colonial Users. Numerous illustrations, etc. The price will be one penny as usual.

South African Hill-climb.

The Pretoria Motor Club held a very successful open hill-climb for motor cycles last month. Results: 2½ h.p. and under.—1, Metzger (H. and R. Precision), 39½s. 2, J. Hodgkinson (Hobart), 42s.; 3, W. Bosch (Wanderer), 47½s. 4 h.p. and under.—1, R. Cotter (T.T. Triumph), 32½s.; 2, E. Rose (F.E. Rudge), 34s.; 3, J. Hodgkinson (F.E. Triumph), 34½s. After this event a sweepstake open to all machines on the ground was held, which resulted as follows: 1, R. Cotter (T.T. Triumph); 2, Cutting (T.T. Bradbury); 3, Mozer (T.T. Bradbury).

A. Hill v a Hill.

Mr. Alan Hill called at our office a few days ago and informed us that he climbed Mucklows Hill, between Halesowen and Birmingham, on Monday afternoon with a 3½ h.p. Rudge and sidecar, carrying a combined weight of 47 stones. He also succeeded in restarting on the gradient half-way up with three passengers, whose combined weight amounted to 35 stones. The gear used was the N.S.U., giving ratios of 4½ to 1 and 6½ to 1. This speaks well for both the Rudge machine and the N.S.U. gear.

Scottish Hill-climb.

The Glasgow club autumn members' hill-climb was held last Saturday at Garslake Hill, a steep rise about half a mile long. W. Hunter (7 h.p. Indian) made fastest time (38½s.)

Class 1 (lightweights).—T. L. Rankine (2 h.p. Singer), figure of merit 212; W. Watt (2½ h.p. Enfield), 199.

Class 2 (single-cylinders).—R. M. McCulloch (3½ T.T. Triumph), 249; H. W. Ballardie (3½ T.T. Triumph), 243; J. S. Grant (3½ T.T. Triumph), 212.

Class 3 (twins).—W. Deans (5 h.p. Indian), 166; W. Hunter (7 h.p. Indian), 158.5.

Class 4 (passengers).—W. Hunter (7 h.p. Indian and sidecar), 132; Hans Stick (3½ h.p. Humber and sidecar), 114.

Miss N. Baxter (3½ h.p. Rex), whose skill at Newnham on Saturday last was much admired.

Motor Cyclist and Prospective Airman.

C. T. Newsome, who won a gold medal on a $3\frac{1}{2}$ h.p. Rover in the recent 1,000 miles trial, in addition to being a keen motor cyclist, is also interested in aviation. With a friend he is at present constructing an aeroplane in which he hopes to be flying at an early date.

Belgian Motor Cycle Race.

The silver cup presented by the "Express" (Belgium) in connection with the motor cycle race organised by the Motor Cycle Club of Liège was won by a Monsieur Fagard, riding a Sarolea motor cycle fitted with the new type $3\frac{1}{2}$ h.p. Sarolea ball bearing engine.

Coventry Hill-climb Notes.

Quite phenomenal results were obtained on Saturday last by G. Smith on the new $2\frac{1}{2}$ h.p. single-cylinder Singer. This machine has an engine with a bore of 69 mm. and a stroke of 79 mm. The machine was responsible for three firsts on formula, and had it been entered in the lightweight class, it would have won both on time and formula. The best figure of merit of the day was secured by the same rider with 434 points.

First, second, and third positions on time in Class 1 stand to the credit of the Precision engines—a fact of which their makers are justly proud.

It was freely reported on Saturday that a Rudge lightweight machine had been seen on the road during the last few days. It is quite true that a special light Rudge was on the road, but it had the ordinary $3\frac{1}{2}$ h.p. engine, and was only reduced in weight for the purpose of hill-climbs where there are no restrictions as to equipment. This model weighs about 140 lbs., and may be reckoned to give a good account of itself when it is thoroughly tuned up.

A. Mackenzie Cott's 8 h.p. J.A.P. was if anything a bit too powerful even for an easy hill like Newnham. The pace of a projectile of this description, even on a moderate bend, is so high that it is imperative to cut out to get round, and it was only three-fifths of a second faster than Newsome's $3\frac{1}{2}$ h.p. Triumph. Allowing for the difference in the weight of the riders, one may reasonably ask what advantage is there in riding a machine of this power? Cott's time equals a speed of $52\frac{1}{2}$ miles per hour, whilst Newsome's came out at 51.8 miles per hour.

The Rover win in the variable gear class was a popular one. C. T. Newsome is a trier, and the fact that he won first position on time, and was awarded the formula prize, owing to Alan Hill unfortunately failing to stop his wheels between the strips, was a creditable performance, and is another feather in the cap of the Armstrong three-speed gear. A similar gear was fitted to Roy Walker's New Hudson-Jap, which gained first place on formula in the lightweight class.

It was unfortunate there were not sufficient novice entries in several classes to allow the special club prize to be presented for the best performance on formula and on time by members who had never won a prize in a hill-climb. Incidentally, there were some very warm novices on the hill, who, although they may not have won prizes in hill-climbs, have performed creditably in other events.

Premier Profits.

A net profit of £27,478 7s. 11d. has been made by the Premier Cycle Co., Ltd., on the past year's working, dividends being recommended at the rate of $7\frac{1}{2}\%$ on the preference shares, and 10% on the ordinary.

The R.I.A. Midland Centre Scheme.

The Midland Centre of the Roads Improvement Association has been established to enable motor cyclists and other road users to take a greater interest in the condition of their roads. The membership subscription has been fixed at 5s. per annum, or £1 1s. for five years. The Association is well worthy of the support of all motor cyclists, its objects being as under. To secure that—

(a.) No metal is left unrolled or loose upon the road surfaces at night or over week-ends.

(b.) Road repairs are carried out, as far as possible, over half the width of the surface at a time.

(c.) Patching of surfaces and repair of pot-holes shall be properly done.

(d.) Gritting of street surfaces shall be done with more suitable material, having some regard for rubber tyres.

(e.) Roadside grass margins shall be properly sloped to enable wheels to mount them with a minimum risk of accident.

Subscriptions should be sent to The Secretary, the R.I.A. (Mr. Wallace E. Riches), Caxton House, Westminster, S.W.

Midland Road Information.

Three steam rollers are at work on the Birmingham-Hagley-Kidderminster Road—one on Mucklows Hill, one in Halesowen, and one on Hagley Hill.

Harry Long's Long Ride.

Harry Long completed 30,000 miles of his long distance ride last week. We publish a photograph on page 929 taken by *The Motor Cycle* photographer, which depicts Long on a boneshaker with his $3\frac{1}{2}$ h.p. "Mile Eating" Triumph alongside. Our photographer has been facetious enough to write on the print that Long thinks of changing his mount for one of the pedal-propelled wooden-spoked bicycles on which he is depicted, but we do not think there is any likelihood of any such alteration being made while his Triumph continues to carry him so well.

A.C.U. Club Championship.

The following clubs have entered for the A.C.U. inter-club championship on September 16th: Coventry and Warwickshire M.C. (holders), Wolverhampton and District M.C.C., Herts County A.C., N.W. London M.C.C., Birmingham M.C.C., Chesterfield and District M.C.C., Streatham and District M.C.C., and Oxford M.C.C. The course is a secret one, in the Midlands, measuring forty-two miles, and it will be covered four times. The starting and finishing point will be at Banbury, Oxon. Teams will consist of six riders, one of whom must drive a passenger motor cycle.

G. Smith ($2\frac{1}{2}$ h.p. Singer), who won three cups at the Coventry Club's hill climb on Saturday last. The rider on the left is A. Mackenzie Cott who rode his 8-10 h.p. J.A.P. to victory in the All Comers' class.

IRISH END-TO-END SIDECAR RECORD.

HUGH GIBSON and J. Eastwood, mounted on a $3\frac{1}{2}$ h.p. Bradbury and sidecar, left Mizen Head at 4.35 a.m. on the 31st ult. for Fairhead, Co. Antrim, with the intention of establishing an Irish End-to-end sidecar record. The riders were in Cork at 7.23 a.m. on the same day, C. E. Murphy, of Cootehill, acting as pilot. The record breakers were followed by P. Platt, another Bradbury rider, and were timed by M. Chambers.

Lessons of the Ride.

In a letter to us Mr. Gibson says that he has learned several important things in the End-to-end Irish ride which could never have occurred in ordinary touring tests. He therefore feels particularly pleased when he hears the argument trotted out that road records are useless. He reckons the Irish End-to-end record is worth quite £1,000 to the makers of the machine he rode, irrespective of its value as an advertisement. Incidentally, he mentions that Mr. J. Eastwood, who accompanied him, made quite a good haul in orders, as upwards of forty orders were handed to Mr. Eastwood, who, however, could only accept them subject to confirmation from the works.

The whole ride was accomplished with one puncture, and the only contretemps which occurred was when the chain jumped off the sprocket through the machine being turned on to the grass to avoid a restive horse. This lost the riders fifteen minutes, because the chain locked between the spokes and the sprocket. Another little incident was when a cart and horse backed across the road, and the riders just managed to swing on to the footpath and back again on to the road without stopping—a rather narrow escape, which somewhat controverts Mr. Gibson's argument that road records are quite harmless.

That thorough sportsman, C. E. Murphy, had a puncture, but the others stopped to help him, as he had lost all his tools. Near Cork the pacer's machine caught fire, but the conflagration was soon extinguished. Two other pacers, P. and G. Simpson, lost all their tools.

No Mechanical Troubles.

Gibson says the road was difficult to find, and the surface was bad to Cork. Good roads were experienced from Navan. Gibson concludes by saying that he stopped twenty-five minutes at Navan for food, had no mechanical trouble at all, rode in a following wind all the way, and had rain for the last hour. There were no police traps, no speed limits, and no accidents. His wrists and arms were sore, otherwise he was quite fresh at the finish.

He left Mizen Head, as we have already pointed out, at

4.35 a.m., Cork 7.23 a.m., Cashel 9.35 a.m., Navan 1.50 p.m., Banbridge 4.20 p.m., Fairhead finish 6.39 p.m. Total time, 14 hours 4 mins.

The riders were started by Coastguard Richard Tucker, of Mizen Head, and timed in by N. MacNaughton, of Ballyvoy, witnesses being C. E. Murphy, J. Stewart, and the passenger J. Eastwood. The machine was sealed and examined both at the start and finish. The total weight of the combination and passengers was nearly 600 lbs. C. E. Murphy's time on a Triumph was 13 hours 6 minutes.

Irish End-to-End record. Hugh Gibson and his passenger, J. Eastwood, with the $3\frac{1}{2}$ h.p. Bradbury and sidecar. The photograph was taken at Fair Head, Co. Antrim. The headland can be seen in the distance. Mr. Eastwood is said to have booked forty orders for these machines as a result of the ride.

The argument that a $3\frac{1}{2}$ h.p. engine is not powerful enough for a sidecar is, we think, sufficiently answered by Mr. Gibson's two excellent rides on the Bradbury machine and sidecar. The equipment of the machine was as follows: Bradbury $3\frac{1}{2}$ two-speed gear, chain drive, Hans Renold $\frac{5}{16}$ in. chains, Dunlop studded tyres 26 in. by 2 $\frac{1}{2}$ in. and Bradbury sidecar. The riders made use of Wakefield oil.

TOURING SCENES IN NORWAY.

The reproductions above are from photographs by Mr. H. Landstad, who has recently been touring in Norway with a 7-9 h.p. V.S. and Mills-Fulford sidecar. He was advised to ride solely on account of the bad state of the roads, of which the photographs give some idea. Observe the deep wheel ruts. It says much for the strong construction of motor cycles and sidecars that they can emerge successfully from such a strenuous test. It may be added that a Cairns tyre has been successfully used on the driving wheel for 1,300 miles.

CLUB NEWS.

Motor Cycling Club.

This club will have a run to Clacton-on-Sea on September 24th. An early start will be made and breakfast will be taken at Bishop's Stortford at 9 a.m. Lunch at the Royal Hotel, Clacton-on-Sea.

N.E.A.A. and Sunderland and District M.C.

The reliability trial to Patterdale and back on August 26th resulted as follows: 1. R. B. Smith, G. W. Raper, T. Smith and J. B. Reed; 5. J. Whittaker; 6. F. Turvey and C. F. Christon.

North Middlesex M.C.C.

Although in a recent match the N.W. London M.C.C. appeared at first to be the winners, yet it was discovered by checking the time sheets that the North Middlesex M.C.C. had the advantage by a margin of several points. They have therefore qualified for the medals.

North-west London M.C.C.

Entries have filled well for the gymkhana at the Stadium on the 9th, at 2.30 p.m.

The entrance for motor cycles is by gate "H" in Wood Lane; this will however be only open from 2 to 3.30 p.m. Competitors only proceed into the arena. Machines may be garaged at a cost of threepence in an enclosure near "H" gate inside the exhibition. Cover is not guaranteed.

The following have offered prizes for the various events:

Triumph Cycle Co. (gold medal), Bat Manufacturing Co., Bosch Manufacturing Co. (two cases spare parts), Hanover Rubber Co. (steel and rubber studded tyres), Stanley Belt Co. (belt), XI-all Specialities (pan seat), Rey and Company (exhaust whistle), Alfred Dunhill, Ltd. (overalls), J. Lucas, Ltd. (horn), also Messrs. Ernest Scott, Ashworth, Hal Hill, Sheard, Pooley, Stern, Rowden, and Thomas.

Streatham and District M.C.C.

On Saturday, September 30th, the last open hill-climb of the season will be held by this club, containing the following classes:

Class I.—Lightweights in touring trim, not exceeding 340 c.c.

Class II.—Single-cylinder touring motor cycles up to 500 c.c.

Class III.—Multi-cylinder touring motor cycles up to 1,000 c.c.

Class IV.—Variably geared touring motor cycles. Singles up to 500 c.c., multi-cylinders up to 1,000 c.c.

Class V.—Any type up to 500 c.c.

Class VI.—Any type up to 1,000 c.c.

Class VII.—Passenger machines.

The following formula will be used: $\frac{W}{C \times T^2}$. The hon. sec.

is Mr. J. H. Jeffery, 10, Daysbrook Road, Streatham Hill, London, S.W.

Ilkley and District M.C.C.

The 200 mile reliability trial for a silver trophy presented by Harry Hemingway was run off on August 27th, the route being from Ilkley to Keswick and back. The run was in the nature of a team trial, a team consisting of two riders, and there were five teams entered, but owing to the severe weather and the trying nature of the course only three teams succeeded in getting through. Owing to the heavy and incessant rain on the homeward journey, competitors suffered severely from water on their magnetos and slipping belts, besides the usual punctures. The winning couple proved to be J. Norman Longfield (3½ h.p. T.T. Triumph) and Denison Wilson, jun. (3½ h.p. Bradbury), who only lost three marks; the second was Roy Cowling (5 h.p. Matchless-Jap) and John Rudd (3½ h.p. Bradbury), who gained club silver medals; and the third Charles Thackray (3½ h.p. J.A.P.) and A. Drummund (5 h.p. Johnson), bronze medals.

NEWNHAM HILL CLIMB. Scene at the summit. [No. 49, R. N. Corah, finishing. On the left are the judge, timekeeper, results calculators, and others.

Club News.—

Sheffield and Hallamshire M.C.C.

The annual competition for the club cup was held on Saturday from Largate, Sheffield, to Pickering and back via Rotherham, Doncaster, Ferrybridge, Tadcaster, York, Easingwold, and the terrible Sutton Bank, Helmsley, and Pickering, back via Malton, York, Tadcaster, Ferrybridge,

Sheffield and Hallamshire M.C.C. reliability run to Pickering and back for the club cup. Our picture shows Mr. and Mrs. MacBourne with their twin Zenith and sidecar ready to start from the Victoria Memorial.

Doncaster, Rotherham, and finishing at the Plumper's Hotel, Tinsley. The competition was for reliability, not speed, and the officials had fixed secret controls along the route, no competitor being allowed to travel faster than twenty miles per hour. All competitors were timed by their own watches, which were carried in sealed cases. The results are being worked out on formula, and cannot be verified till they have the confirmation of the committee.

Manchester M.C.

For the first time in its history the Manchester Motor Club carried out a very successful gymkhana and garden party on Saturday, September 2nd. It was held in the grounds adjoining the "Old Ship Hotel," Styal, Cheshire, and about 200 members and friends attended. The weather being everything that could be desired. The motor cycle and mouse trap race was won by Mr. Munroe. Motor cycle cigarette race, Mr. White and Miss Kilner. Tug of war, motor cyclists v. car owners, motor cyclists won. Motor cycle number race, Mr. Sykes 1st, Mr. Castagnoli 2nd. Motor cycle obstacle balloon race, Mr. Sykes 1st, Mr. Castagnoli 2nd. Tall hat motor cycle race, Mr. Coupes 1st, Mr. Castagnoli 2nd. Sidecar event, Mr. Bottome and Miss Crossley. A special vote of thanks was passed to Mr. Ward for arranging the various events, also to Mr. Glazebrook for acting as official timekeeper. As the afternoon was so successful it is to be hoped that it will be an annual fixture for the club.

Edinburgh and District M.C.

The Amulree open hill-climb will be held on Monday, September 18th. There will be the following classes: I., Novice class (handicap); II., Handicap (up to 400 c.c.); III., Handicap (400 c.c. to 600 c.c.); IV., Handicap (600 c.c. and upwards); V., Tyro class (handicap); VI., Scratch class (up to 600 c.c.); VII., Unlimited scratch class; VIII., Passenger class (handicap). Classes I. to V. are open to standard touring mounts.

The Trials Committee beg to thank the following firms for their assistance in offering prizes: North British Rubber Co., Ltd., pair of tyres and tubes; Messrs. Alexander and Co., Edinburgh, motor cycle valise; Messrs. Joseph Lucas, Ltd., lamp and generator; Messrs. Morrison Bros., Edinburgh, Cowey speedometer; Messrs. Rossleigh, Ltd., Edinburgh, Brooks belt and tube case; Messrs. Lycetts, Ltd., Lyso belt; Messrs. C. C. Wakefield, five gallons Castrol oil; Palmer Tyre Ltd., Palmer tyre and tube; also Mr. W. R. Green, F.R.S., lamp and generator.

This attractive prize list should certainly secure a large number of entries and help to make the event one of the

most interesting competitions held by the club this season. Entries close Monday, 11th inst., to the trials secretary, Percy E. Tolfree, 47, Falcon Avenue, Edinburgh, who will be pleased to give all further particulars, rules, etc.

Perth and District M.C.C.

Over a score of members met at luncheon in Scotland's Hotel, Pitlochry, on the 23rd ult., and, after being weighed at the railroad depot, proceeded via Tummel Bridge to the south-east apex of the well-known Trinafour Triangle.

The occasion was the club's hill-climb to determine the destinations of the two gold medals awarded for first up in Class A (formula) and first in Class B (maximum difference) respectively, and other prizes.

The hill is not quite up to the Amulree standard of stiffness; the loose surface combined with the corners lends a distinctly sporting quality to the ascent. The weather conditions were of the best.

W

The formula used in Class A was $\frac{W}{C \times T^{1.5}}$, and an

analysis of the recorded times and other data discloses the following results:

CLASS A.—1, J. W. Adamson (3½ h.p. T.T. Triumph), gold medal, 1,064; 2, D. Batchelor (3½ h.p. T.T. Triumph), 836; 3, Hon. A. J. M. Stuart (3½ h.p. T.T. Triumph), 755. Other scores are: 4, J. G. Beveridge (3½ h.p. Touring Triumph, 84 x 86), 642; 5, Bruce Syme (3½ h.p. Touring Rudge), 626; 6, Douglas Scott (3½ h.p. B.S.A.), 604; 7, A. H. Geddes (3½ h.p. Ivy-Precision), 502; 8, Hon. J. G. Stuart (2½ h.p. Douglas), 495; 9, D. Cairnie (2½ h.p. Douglas), 414.

In Class B (maximum difference) all but two competitors failed to keep going in the slow test, and were disqualified. The results in this class are:

CLASS B.—1, J. W. Adamson (3½ h.p. T.T. Triumph), gold medal, difference 3m. 23½s.; 2, Hon. A. J. M. Stuart (3½ h.p. T.T. Triumph), difference 3m. 14s.

The timekeepers were Messrs. A. F. Dalglish and J. W. Robertson.

Essex M.C.

On Saturday last a hill-climb for medals presented by Mr. Cummings was held at Chinnor. The hill, which had been kept a secret, proved a very sporting one. The results were as follows:

	SINGLE-CYLINDERS.	M. S.	Formula.
1.	F. W. Applebee (2 Centaur) ...	2 5½	988.6
2.	H. A. Evans (3½ Rudge) ...	1 18	1114.0

	TWIN-CYLINDERS.	
G. L. Fletcher (2½ Douglas) ...	1 24½	978.8

LIGHTWEIGHTS.

1.	F. W. Applebee (2 Centaur) ...	1 45½	829.9
2.	G. L. Fletcher (2½ Douglas) ...	1 25	983.3

After the climb tea was partaken of in a garden on the hill. The thanks of the club are due to Mr. Cummings for a most enjoyable afternoon.

Essex M.C. hill-climb. An impromptu tea in an orchard while the officials work out the results.

Club News.—

North Middlesex M.C.C.

On Saturday, September 9th, there will be a week-end run to Clacton-on-Sea, starting from Ye Olde Gatehouse, Highgate, at 3.30 p.m., and for the benefit of those unable to join this party a second division will leave the Gatehouse at 6 a.m. on Sunday. Headquarters "The Black Boy," Weeley, near Clacton.

Willesden Green C. and M.C.C.

A speed-judging contest over a secret course was held on August 27th, the winners being: 1, A. W. Loughlin (3½ h.p. Pengeot); 2, J. C. Ball (3½ h.p. N.S.U.); 3, W. Gregory (7.9 h.p. Pengeot and sidecar). The course was very rough and hilly, and the numerous lanes made it very hard to find the course. The next trial is to Towcester and back, non-stop, on September 17th.

Harrogate and District M.C.C.

On the 27th ult. this club held a team reliability trial over a twenty-five miles course, which included Leathley Bank, Pot Bank, and the well-known Norwood Edge, and which had to be completed four times in all, marks being deducted for any kind of stops and also for being late or early at the control. The first two laps were completed in fine weather. The third lap, however, was run in wet, and for the last lap the rain came down in torrents. The following is the result:

*J. E. Brooke (3½ h.p. T.R. Triumph).—Lost no marks.
*W. E. Grange (3½ h.p. Bradbury, two-speed).—Lost 1 mark.
†F. Mackay (3½ h.p. T.T. Singer).—Lost 2 marks.
H. W. Fortune (3½ h.p. Triumph).—Lost 10 marks. Failed Leathley last lap.
E. R. Davies (3½ h.p. Triumph).—Lost 30 marks. Started engine outside control and failed Leathley last lap.
*C. P. Finn (2½ h.p. Enfield, two-speed).—Lost 33 marks. Failed on hills last two laps.
†T. Dearlove (3½ h.p. P. and M., two-speed).—Lost 40 marks. Stopped once first lap for no apparent reason.
†C. Nettleton (3½ h.p. Humber, two-speed).—Lost 57 marks. Failed to start machine in given distance and failed on hill third lap and also fourth lap.
T. Atkinson (3½ h.p. T.T. Triumph).—Retired after third lap; tyre troubles.
W. B. Atkinson (3½ h.p. Calthorpe).—Retired after second lap.
G. Shepherd (3½ h.p. B.S.A.).—Retired after second lap.
W. Aldon (3½ h.p. Premier, three-speed).—Retired first lap; lost way.
W. Richmond (5 h.p. Rex, two-speed).—Retired first lap; failed Leathley and lost way.
*Winning team. †Second team. The only two teams to finish.

Edinburgh and District M.C.

The annual team competition for the Waverley Trophy takes place on Saturday, September 9th. The competition is a fifty miles reliability trial, with two timed hill-climbs, and is open to all Scottish clubs. The trophy is a most valuable one, and was presented by J. M. Dobson. Entries close to-day (Thursday, September 7th). The organising secretary is Mr. W. R. Green, 8, Argyle Crescent, Joppa, Edinburgh.

Shropshire M.C.C.

A hill-climb on the knock-out principle was held on August 27th on Wenlock Edge.

CLASS I., for lightweights, was abandoned, owing to the lack of the necessary five entries.

CLASS II., for standard touring singles up to 600 c.c.—Four started. 1, A. J. Poole (3½ h.p. Bradbury); 2, S. W. Moss (3½ h.p. Triumph); 3, C. Rice Oxley (3½ h.p. Triumph)

CLASS III., any size single or twin (racing class).—1, H. G. Potts (3½ h.p. T.T. Triumph); 2, A. L. Ommanney (3½ h.p. Rudge); 3, T. Shaw (3½ h.p. T.T. Triumph).

Herefordshire M.C.C.

A reliability trial in connection with the Challenge Bowl lent by the Herefordshire Automobile Club was held on August 27th, the route chosen being *via* Fromes Hill and Worcester to Stratford-on-Avon, returning *via* Worcester, Malvern, and Ledbury to Hereford—a total distance of 109 miles. Fromes Hill was chosen for an observed hill-climb, of which two clean ascents were made, the remainder "konking" out about sixty yards from the top. The trial resulted in a comparatively easy win for Mr. Vale, of Leominster, who made a non-stop run. Result:

Position.	Rider and machine.	Marks lost.
1.	T. B. Vale (3½ Triumph)	0
2.	G. F. W. Spencer (3½ Humber)	2
3.	A. Smith (3½ Arno)	3

Halifax and District M.C.C.

The club's second reliability run was held on August 27th, Scarborough being the objective. About fourteen members entered for the competition. The speed for the solo machines was fixed at 20 m.p.h.; and for sidecars 18 m.p.h., while York was the only intermediate official stop. One mark for each minute early or late at controls was deducted, as well as five for each stop and for any adjustment to machines. Heavy rain fell all the way back from Scarborough, and the competitors were wet through on their arrival at Halifax. The ultimate winners after a keen contest were: 1st, F. E. Jackson (twin Rex de Luxe), lost no points; 2nd, H. B. Holdsworth (3½ h.p. Rex) and E. Farrar (2½ h.p. New Hudson), who share second and third prizes, both losing 5 points.

OPEN SPEED TRIALS ON THE SANDS AT MAGILLIGAN, organised by the Motor Cycle Union of Ireland (Ulster centres).

A. Combe (3½ h.p. Premier), winner of the 20 and 50 miles open handicap, starting in the 50 miles race.

A. Kirk (3½ h.p. Triumph), winner of the ten miles scratch race, connecting a long exhaust pipe after the event.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Loss of Power.

Q I am troubled by my machine going well for about ten or twelve miles and then showing obvious signs of fatigue on hills, finally stopping dead on anything more than about 1 in 15. Sometimes, though rarely, the trouble starts in less than the distance mentioned above. If you can assist me I should be very much obliged.—H.C.R.

We should imagine that your cylinders and pistons are liberally coated with carbon deposit as the result of long running. This carbon deposit should be scraped off, for which purpose the cylinders must be removed. Also check the amount of opening of the valves. Maybe the engine is being throttled.

Edinburgh to Plymouth and Return.

Q I intend going from Edinburgh to Plymouth via Bristol, and wish to come home via London (if possible) by Weybridge for Brooklands, and should be much obliged if you could give me the best routes avoiding London, and, if you could, the name of a good garage near London where I could leave my machine, as I wish to spend a few days in London on the way home?—A.H.M.

It would be best to follow the Moffat, Carlisle, Kendal, Lancaster, Preston, Warrington, Shrewsbury, Leominster, Hereford, Gloucester, Bristol, Cross, Taunton, Exeter. Plymouth road on the way down, and from Plymouth through Exeter, Chard, Sherborne, Shaftesbury, Salisbury, Andover, Basingstoke, Bagshot, Horsell Common, and Weybridge for Brooklands. Any of the garages in the neighbourhood of London would be suitable for putting up your machine during your stay in the city. Of course, it would be better to bring the machine right into the city and put it up at one of the bigger garages which are open day and night, such as Friswell's, 1, Albany Street, N. In the event of your doing so we should advise you to ride in over Hammersmith Bridge, High Street, Kensington, through Hyde Park, Marble Arch, Baker Street, and Regent's Park, where anybody will be able to direct you to the garage in question. The return route might be taken conveniently from the same place to, Finchley, Barnet, Hatfield, Baldock, Biggleswade, St. Neots, Stamford, Grantham, Newark, East Retford, Doncaster, Selby, York, Thirsk, Darlington, Durham, Newcastle, Alnwick, Berwick-on-Tweed, and Edinburgh.

Cost of Second-hand Machines.

Q I am about to purchase a second-hand machine. I know nothing about motor cycles at all. I should be glad if you will give me a few particulars through *The Motor Cycle*. (1.) Are there any books on motor cycles? (2.) I thought of giving about £10 for one. Could I get a fairly good one for that, second-hand, of course? (3.) Are motor cycles very expensive in upkeep, and what would the cost be per year for a fair amount of riding?—BEGINNER.

(1.) Yes, there is "Motor Cycles and How to Manage Them," which will give you all the information you require. This can be obtained price 1s. 2d. post free from these offices. (2.) With luck you could get a reliable machine for the price mentioned. (3.) With regard to expense of upkeep. The older and cheaper a machine is the more the upkeep costs as a rule. If you pay a good price in the beginning the price of upkeep would be small. It usually amounts to between £10 and £12 per annum, but everything depends on the rider.

Failure to Answer to Throttle.

Q I have a 2½ h.p. machine, automatic inlet, accumulator and trembler ignition. It runs very well with spark almost fully retarded and the throttle about one-third open, the speed being about 15 m.p.h. If, however, I open the throttle more, and the extra air in proportion, it does not seem to make any difference to the speed. Also when the spark is advanced the tendency is to slow down rather than accelerate. The peculiar part is that it answers well to these controls on the stand. (1.) Can you give me the cause and remedy? (2.) The compression bears my weight on the pedal for about seven seconds. Is this sufficient? (3.) Occasionally the machine gives out after running a few miles, but on dismounting will start again immediately. Can you account for this?—J.W.H.

(1.) Your machine needs adjustment all round. Try the contact breaker. See that the points of the make and break, or wipe, make proper contact in whatever position you set it. Next try a larger choke tube or a smaller jet to the carburetter. The cause of the machine occasionally stopping may be due to a temporary obstruction in the jet or petrol pipe. (2.) The compression seems fairly satisfactory. (3.) Probably an obstruction in the petrol pipe.

Silencer Under Sidecar.

Q I have read with interest your articles on silence lately appearing in *The Motor Cycle*, especially the one concerning the transference of the exhaust silencer to the sidecar. I have an 8 h.p. Chater Lea and sidecar, J.A.P. engine. (1.) Do you think I could make it quieter by using a larger silencer under the sidecar? If so, what particular silencer would you recommend me to get? (2.) How much power should I lose by doing this? I am willing to sacrifice a little power if I can get a substantial decrease in noise. (3.) What would be the dimensions and form the proposed silencer should take?—R.L.D.W.

(1.) Yes. Any of the good silencers which are at present on the market would be suitable for the machine you mention. One which gives very good results in ordinary practice is the Clair, sold by Messrs. J. C. Lyell and Co., Ltd., 113, Great Portland Street, W. (2.) There should be but little or no loss of power with a good silencer of ample dimensions, but you could prove this to your own satisfaction by use of the cut-out. (3.) We recommend you to consult Messrs. Lyell, giving dimensions and speed of engine.

How to Run Slowly.

Q My machine is a standard 3½ h.p. Bradbury. (1.) If I run about fifty miles or if only thirty off the reel, I can only just bear my hand on the bottom of the crank case. Is this as it ought to be? (2.) I can only get eighty miles per gallon of Shell spirit. (3.) I cannot get it to run slowly. (4.) When I flood the carburetter the petrol runs out at the funnel of the fixed air intake until engine is running, and if I stop for a while the drip continues. I may say the timing, valves, and magneto are correct, makers' setting, also piston rings run quite freely. I give a pump-out of oil every ten miles.—T.H.

(1.) We do not think you need worry about the crank case being hot. This is frequently the case with motor cycle engines; it is due to conduction. (2.) Perhaps you will get more economy by using a smaller jet and smaller choke tube in the carburetter. This will also enable you to go more slowly. (3.) See last answer. Close extra air, nearly close throttle, and retard spark. (4.) Probably if you turn the needle valve round in its seating you will dislodge a piece of grit which causes the carburetter to flood slightly.

*Striking
Evidence
of the
many merits
of the
B.S.A.
Motor Bicycle*

"POWER, COMFORT, RELIABILITY."

"I have just returned from a Cycling Trip in North Wales, and wish to congratulate you on the excellence of the B.S.A. Motor Cycle used. This machine (which has completed 2,000 miles) took a sidecar (passenger and self exceeding 22 stone in weight) from Birmingham through Bettws, Capel Curig, Beddgelert, etc., singly geared, without failing on a single hill, and has proved most satisfactory as regards its power, comfort, reliability, and general excellence.

"I have had single, twin, and 4-cylinder machines of various makes, but none to equal your 1911 3½ h.p. Roadster Model."

"B.D.," Edgbaston, August 29th, 1911.

THE B.S.A. MOTOR BICYCLE

is recognised as the most perfect machine on the road. Its distinctive finish, its silence, power, and smoothness of running are points that are fully appreciated by those who have ridden other makes.

For Motor Cycles?

"The Royal Enfield Year."

Nineteen-eleven is acknowledged throughout the motor cycling world to be the "Royal Enfield Year." Every competition and trial in which "the most perfect lightweight ever produced" has taken part, shows re-

sults which cover the $2\frac{3}{4}$ h.p. two-speed and free engine Royal Enfield with glory—results which should be borne in mind and govern your choice when contemplating purchase.

The latest achievements include:—

A.C.U. Six Days' Trial, Aug. 14th to 19th

four entered and finished, gaining four medals.

Brooklands Meeting, Aug. 26th, Class B.

first prize, covering over 54 miles in the hour.

Let us send you a list of other notable performances, with the art book which fully describes and illustrates the many exclusive features of this "no trouble" machine—the motor cycle that will take you out and bring you back every time.

Redditch, & 48 Holborn Viaduct, E.C.

Gears. Plugs with Three Points.

?

(1.) How can I arrange to fix a two-speed to my 3½ h.p. Quadrant? The machine is one of the older type, but is very powerful and in excellent condition. The present pulley runs close up to the crank case, and any addition would have to come into the same line to drive fairly on rear wheel pulley. (2.) Would you also tell me if a plug of the Oleo type with three sparking point consumes more current than the one point type, or does it only spark from one point each time contact is made?—E.J.L.

(1.) What we should recommend you to do is to get into communication with the best known gear manufacturers, such as the N.S.U. (N.S.U. Motor Co., Ltd., 185, Great Portland Street, W.), Fit-All (Lake and Elliot, Albion Works, Braintree, Essex), and give them the dimensions of your engine shaft. Or you might fit a hub gear such as Millennium (Lake and Elliot) or Roc (A. W. Wall, Hay Mills, Birmingham). (2.) We do not think you will find any difference as regards the current consumption with the different plugs you use. Most certainly only one of the three points will work at a time with the plug you mention. The current always chooses the easiest path it can find.

Overheating and Bad Compression.

?

(1.) There is no sign of blowing behind the piston rings. The plugs, compression taps, and inlet valve caps show no sign of any leakage. And yet when the valves are just ground in, there is no more compression than in a low compression car, and I always start with the handle (Roc clutch), without lifting the exhaust valves. What can I do to give me a reasonable amount of compression? (2.) I have fitted a second release valve to my crank case. I use Vacuum "B" oil, and give it plenty (until it smokes sometimes). I have tried various sized nipples in the carburetter (B. and B.), and yet it always gets excessively hot, and will not take a slope sometimes, without a passenger in the sidecar that it will fly up when cool with a passenger. I am sure the magneto and valves are timed correctly as I have had expert advice. Can I do anything to get it to run cooler? (3.) Would a hole in each cylinder at the bottom of the stroke (connected by a pipe to the exhaust pipe) be any help? And would it help to keep my valves from burning? as I have to grind them in every 200 or 300 miles, and sometimes in less than 100 miles!—A.P.C.

in your second paragraph, and there must be some defect in one of the pressure tight surfaces which must be located before the trouble will cease. (3.) Auxiliary exhaust ports are not of much value in touring although they certainly make a difference in racing. The fact of the valve faces burning so quickly seems to suggest that they are not a good fit.

Magneto Troubles.

?

Can you tell me the reason for the following magneto trouble and how to remedy it? Magneto, 1911 Bosch, fitted to 5 h.p. twin Rex. I can get a beautiful spark at the front plug, but at the rear plug the spark seems never to be as strong as it should be; in fact, at slow speeds (below about 12 m.p.h.) only the front cylinder will work, unless I keep throttle and air levers nearly half open. Valves, compression, and other details of engine and carburetter seem all to be in order, and this weak spark seems to be the fault to remedy. I have cleaned the plug, and small carbon in magneto, and attended to the faces of the platinum points, but I cannot get a strong spark at this plug.—A.E.J.

Carefully examine the contact breaker of your magneto and notice if the break is practically the same in the case of both cylinders. Note also if the cam which gives the break is more worn in one case than in the other. Having verified this, examine the carbon brush conducting the current to the back cylinder and notice if this is making good contact, is clean and uncracked. In fact, it would be a good plan to take out both the distributor brushes and clean the distributors by inserting a rag wetted in petrol, and rotate the armature. Also be careful about the plug gap in the back cylinder. We note you have cleaned the small car-

bon under contact maker plate. The point is to look after those which conduct the high tension current. It may be that the carburetter is supplying a weaker mixture to the rear cylinder.

Machine on Trial.

?

Will you please give me advice re the following: A friend had a 2½ h.p. chain-driven motor cycle offered him for £6 10s., and, being a complete novice, thought it was dirt cheap, paid £2 deposit, and had it on trial. It is not satisfactory, and he could not get on with it, so took it back, but the owner refused to take it, and has put the case into court. My friend has to appear next Thursday. Will you please advise me whether it is necessary to instruct a solicitor? Thanking you in anticipation.—H.G.K.

Our legal adviser writes: It would certainly be advisable for "H.G.K.'s" friend to see a solicitor as suggested. If he is able to prove that the £2 paid was deposited as security while he had the motor cycle on trial, and that there was no definite agreement to purchase, he should defend the action, and he ought to put in a counter-claim for the return of the £2. I presume that he returned the motor cycle without delay, as if he kept it an unreasonable time he would be deemed to have purchased it. I presume, too, that he did not sign any agreement to purchase the machine. If he signed any document, and there was nothing in it about having the motor cycle on trial, then I am afraid he would not succeed in his defence, unless, at any rate, he had some witnesses to support his statement.

EXPERIENCES WANTED.

"Clutch" (Brixton Hill). The Calthorpe as a single, and for sidecar use.

Timekeepers and officials in the Sheffield and Hallamshire M.C.C. penalty run at the starting point. From left to right: Messrs. Bellamy (captain), Booth, Smith, and Vale. This photograph is interesting as showing an up-to-date though apparently old finger-post, in which the signs are placed at different levels, and actually point in the required direction.

New Home of the B. and B.

The new works and offices at Witton for Messrs. Brown and Barlow, Ltd., are now completed, and all correspondence should be addressed to Westward Road, Witton, Birmingham.

A Handsome Cup.

The Armstrong Triplex Gear Co., Ltd., have just presented Mr. P. J. Evans with a handsome silver cup bearing the following inscription: "Presented to P. J. Evans, Esq., by the Armstrong Triplex Three Speed Co., Ltd., as a memento of his winning the Junior Tourist Trophy Race, 1911." Our readers will remember that Mr. Evans rode a Humber twin-cylinder motor cycle with the Armstrong three-speed gear.

The Auto Cycle Union Handbook.

The Auto Cycle Union has produced a handbook, which, though somewhat tardy in appearance, is well worthy of the governing organisation of the kingdom. Firstly, the advantages of membership of the Union (to which all motor cyclists should belong, as touring membership only costs 5s.) are set forth with admirable clearness. Next follow the rules of the organisation, a list of the numerous clubs affiliated to it and their officials, and the advantages of affiliated membership. The next section of the book will appeal to all active motor cyclists, since it consists of a list of officially appointed hotels and repairers. Before appointing an hotel, every effort is made to ascertain that it is clean, comfortable, and the charges reasonable from a motor cyclist's point of view, while the same steps are taken to see that every repairer is qualified to undertake motor cycle repairs satisfactorily. Members will greatly assist the Union by reporting their experiences with either hotels or repairers. This list is a most extensive one. The rest of the book is devoted to a short history of the Tourist Trophy Race, a list of motor cycle records, a speed table, *The Motor Cycle* cubical capacity table, a gear and speed table compiled by Mr. Archibald Sharp, an interesting article on motor cycle formulae by Mr. J. W. G. Brooker, and a large amount of legal and touring information, and included in the latter is a useful list of ferries in England and Wales, and information on Continental touring.

A Useful Sidecar.

We are asked to state that the Wolbrown sidecar illustrated and described in our issue of the 10th ult. is of registered design, No. 314,837. Mr. H. Graeme Fenton, 219, Shaftesbury Avenue, W.C., is marketing this attachment.

Chain Transmission.

O. C. Godfrey used Coventry chains on his 7 h.p. Indian and sidecar in the Six Days' Trial. In a letter to the Coventry Chain Co., Godfrey says the chains gave every satisfaction, and they were not adjusted once during the trials.

New Premises.

The North London Garage, 1-5, Corsica Street, Highbury, N., inform us that to cope with the large increase in business, additional premises are in course of construction. The same firm has also opened an accessory showroom.

The 3½ h.p. Twin Premier.

Readers will remember the interest created by the introduction of the 3½ h.p. twin Premier with cylinders firing at even intervals, but which had to take a back seat owing to the strong demand for the 3½ h.p. single-cylinder. A batch of the new twins has now been completed, and samples may be inspected at the London depot of the Premier Cycle Co., Ltd., 20, Holborn Viaduct, E.C.

Toolbag Fixing.

Why is it that so many makers, in attaching toolbags to carriers, use long screws which project half an inch into the interior of the bag? At the present time we have two or three skinned knuckles through groping about in the interior of toolbags screwed to the carriers by screws which are at least ¾ in. to 1 in. too long. A far better plan would be to use shorter screws and rivet the ends over. The above may seem a trivial matter, but it is one calculated to cause considerable annoyance when the rider hastily dives for a tool and tears his hands against one of these annoying obstructions.

A Treatise on Carburettors.

Several readers have written to C. Binks, Ltd., Phoenix Works, Church Street, Eccles, Manchester, for copies of their treatise on carburation. Unfortunately some of them have omitted to give their addresses. Should this paragraph meet their eye they will understand why they have not received a copy.

A Balata and Leather Belt.

The Vennflex is a motor cycle belt which has been designed to transmit full power with the minimum of waste. The belt is built up with a strong layer of Balata material, to which is riveted V blocks of leather, to ensure the necessary gripping effect. The Vennflex Special is the same design, but it has an extra layer of selected rawhide, which makes a stronger belt and is suitable for sidecar machines. The maker of these belts is Mr. W. H. Venn, of 282, Lawley Street, Birmingham.

New Rubber Goods.

The Severn Rubber Co., of 94 and '96, Newhall Street, Birmingham, have now got out several new samples which they have sent for our inspection. The first is a tin of solution with screw stopper, which has been specially introduced for fixing Severn special patches. The fact of it being in a tin with screwed stopper makes it very handy for use. The patches we have referred to before. They are specially treated to enable them to adhere quickly to the tube.

Their generator tubing is made of red rubber with specially moulded ends to prevent splitting. The same firm manufacture motor cycle belts, and make a speciality of retreading covers, which can be returned within two days of receipt. Single jointed air tubes may also be sent for conversion to butted. The firm issue a well got up catalogue containing illustrated descriptions of numerous india-rubber goods of special interest to motor cyclists. For the benefit of colonial and foreign customers, a private code has been specially arranged, which has the distinct advantage of being brief.

Competitors and officials in the Harrogate and District M.C.C. team reliability trial described in our Club News pages.

The 60=MILES=AN=HOUR SINGER

Having increased our production, we are now able to offer quick delivery of the $3\frac{1}{2}$ h.p. Singer Motor Bicycle. Fixed or Free Engine, or Tourist Trophy Models.

THE $3\frac{1}{2}$ H.P.

SINGER

Holds the FIFTY MILES RECORD for its Class.

Time: 48 mins. 37 secs.

In the Ayr Reliability Trials, TWO SINGERS were entered and TWO GOLD MEDALS won.

BUT APART FROM SPEED

the $3\frac{1}{2}$ Singer demands consideration on account of the many practical features in its construction, which make for the comfort and convenience of the rider.

OW THAT THE STRIKE IS OVER

to Morecambe, and give us a hand to shift goods before our time EXPIRES and the Lord TURNS US OUT. The notice is up at end of this month, but as we have always paid regularly, we hope to be allowed to stay another month; therefore COME DOWN and give us a hand to SHIFT THE STUFF.

We still have a lot of new Motor Cycles coming each week, as below; while we have, in second-hand Magneto Machines, about 50, and in Accumulator Machines about 20; and as we are always APPING AND CHOPPING these, you can get go wrong by writing or coming to see them, of Morecambe, as we are always having something fresh in. DON'T FORGET that our cars are the FAIREST ON EARTH, and simply us bringing the shop to you if you can't come here. You send your money for anything you want, and if it is not satisfactory you return it have your money back, and this, too, without return—without deduction or charge of any kind. No one else does this for you; therefore JOHN, of MORECAMBE, is the man to call AT WITH.

Our Stock of Accessories is always the largest in the world, and during the ordinary season we have more Motor Cycles than all the shops in Lancashire put together, and more than five large advertising firms rolled into one. WE ARE out to do business, and are pleased to say we have had a remarkably successful year all throughout, and we are working overtime to execute orders from satisfied customers, many of whom are recommended, and is the cheapest form of advertisement, and most satisfactory from our point of view, and gives us a chance to SATISFY YOU, so that you be able to recommend us to your friends.

We send you a list each month is waiting your postcard, to what you want to buy; what you want to do for it; and how you can pay, as we are at all times prepared to fix you up on Cash, Deferred, or on change terms.

MOTOR BICYCLES FOR SALE

WILTON Cycle Co.

VICTORIA, S.W.—Sea bargains below; all best in stock.

WILTON—Bradburys in stock, free engine, £54, 2-speed, £55.

WILTON—Clyno—sole S.W. agents; trial by agreement; early delivery.

WILTON—Matchless; sole S.W. agency; early deliveries.

WILTON—1911 Kerry-Abindon, 3 1/2 h.p., shop-soiled; £40 to clear.

WILTON—1911 Moto-Reve, 2 1/2 h.p., shop-soiled; to clear.

WILTON—New Enfield, shop-soiled; £33 to clear.

WILTON—1911 Kerry-Abindon, with 2-speed Lucas lamp, horn, mirror, with sidecar, new condition; £50, cost £70.

WILTON—1910 Excelsior, 3 1/2 h.p., fine condition; £25.

WILTON—1911, latest model, No. 1 Clyno, 2-speed lamps, spares, spring pillar and sundries, 1 spring wheel sidecar, cost £90, new condition; £70.

WILTON—Exchanges and instalments, reasonable terms.

WILTON—1910 Moto-Reve, 2 h.p., with accessories; £25.

WILTON—7 h.p. Brown, two, Bosch magneto, and B. carburettor, just overhauled; £30.

WILTON—1909 5 h.p. Sarolea, Chater-Lea, 4 speed new Druid forks, B. and B. carburettor, Bosch magneto, new Rom on back; £30, bargain.

WILTON—3 1/2 h.p. Excelsior, B. and B. carburettor; £8/10; 2 h.p. Precision-Enfield, £6/10.

WILTON Cycle Co., 110, Wilton Rd., Victoria, London, S.W. Phone, 5115 Westminster.

EAGLES—Douglas 2 1/2 h.p. Twin, late 1910, had in use, nearly new; £28/10.

EAGLES—N.S.U., 3 1/2 h.p., 1908, magneto, spring forks, B. and B. carburettor, hna condition; £18/10.

EAGLES—Rex de Luxe, 5 h.p., twin, 1910, new condition, Bosch magneto, cantilever seat, 2 speed free engine, Millford sidecar; £42/10; any trial.

EAGLES—Motococche Lightweight, Helledon ignition, Whittle belt, fine condition; £11/10.

EAGLES—N.S.U. 2 h.p. twin, late 1909, Bosch magneto, m.o.v., 2-speed gear and free engine, Millford sidecar, equal to new; £42; any trial.

EAGLES—Minerva, B.S.A., 2 1/2 h.p., m.o.v., spring forks, adjustable pulley, h.b.c.; £11/10.

EAGLES—Minerva, 3 h.p., m.o.v., magneto, adjustable pulley, h.b.c., very low built; £16/10.

EAGLES—We have a brand new single-cyl. N.S. just delivered, magneto ignition, m.o.v., improved carburettor, h.b.c., Shamrock belts, 1911 spring fork and other improvements, complete tool case, full set tools, stand, etc.; 3 h.p. £27, 3 1/2 h.p. £31, net cash; deferred payments arranged.

EAGLES and Co., High St., Acton, N.S.U. West London district agency.—Immediate delivery of 1911 models; liberal allowances for machines in part payment. Tel.: 556 Chiswick.

SCOTT, 1911, brand new, for immediate delivery, P. and M.—Rey, 5, Heath St., Hampstead.

3 1/2 h.p. Rex, h.b.c., magneto, 2 speeds, free engine, £32.—Stewart, Market Sq., Horsham, Sussex.

REY, 5, Heath St., Hampstead, can give immediate delivery of the following 1911 machines:

P. and M., 1911, in stock, 6 h.p. Zenith, and 3 1/2 h.p. Zenith.

BRADBURY, standard, free engine or 2-speed; immediate delivery; no extra for extended payment.

DOUGLAS, 1911 models, in stock; 2-speed and standard; no waiting; 5% extra for E.P.

HUMBER, 1911, 3 1/2 h.p., 2-speed and free engine model; immediate delivery.

BAT, 7-8 h.p., 1911, new, for immediate delivery; £2

LINCOLN Elk, 3 1/2 h.p., 1911, £34; or 2 1/2 h.p., £28/10; no waiting.

HANDY Hobart, 3 1/2 h.p. twin, 1911, or 2 1/2 h.p.; waiting.

SCOTTS, 1911, 3 1/2 h.p., 2-speed gear, for immediate delivery, no waiting; £60.

RUDGE T.T. Standard and free engine now in stock; no waiting.

B.S.A., 1911, 3 1/2 h.p., for immediate delivery; no waiting; £50.

ALL the Above for immediate delivery, terms, or exchange, or extended payments.—Only address, Rey, 5, Heath St., Hampstead. Tel.: 2678 P.O.

1908 3 1/2 h.p. Triumph, magneto; £25, or near offer, 1911, 3 1/2 h.p., magneto, good tyres, thorough overhauled; £18/10.—29, East St., Barking.

MOTOR BICYCLES FOR SALE.

AMPSTEAD—Only house for great bargains and quick delivery of new 1911 machines you cannot elsewhere; agents for all makes, and makers of the new Ray's sidecar and exhaust whistle—Only address, 5, Heath St. Tel.: 2678 P.O., Hampstead.

AMPSTEAD—Douglas, 1911, model D., almost new, all accessories, run about 200 miles; £35.

AMPSTEAD—Douglas, 1911, 2-speed and free engine model, condition like new; bargain, £43.

AMPSTEAD—1911 Rex, 3½ h.p., brand new, clutch model, handle starting; £39, special bargain.

AMPSTEAD—1911 free engine Triumph, almost new, run about 300 miles; great bargain, £48.

AMPSTEAD—1911 2½ h.p. Royal Enfield, latest model, chain drive, new condition; £36, a bargain.

AMPSTEAD—3½ h.p. Centaur, B. and B., all accessories, good tyres; bargain, £8.

AMPSTEAD—3½ h.p. 1910 Premier, splendid condition, with all accessories; a bargain, only £26.

AMPSTEAD—1911 Triumphs, free engine, T.T. roadster, or standard for immediate delivery from

5, Heath St., Hampstead. Tel.: 2678 P.O. Bargains as below

AMPSTEAD—1911 3½ h.p. Lincoln Elk, shop-soiled condition only; special bargain, £26; all accessories

AMPSTEAD—6½ h.p. twin Roc, 2-speed gear, magneto, spring forks; £25, special bargain.

AMPSTEAD—5½ h.p. twin 1910 Indian, red, splendid condition, all accessories; bargain, price £27.

AMPSTEAD—1911 Rudee, almost new, with all accessories, a fine machine; only £42.

NITH, 8 h.p., 1911, brand new, for immediate delivery, no waiting; 68 gns.; and 3½ h.p.

AMPSTEAD—1909 Moto-Reve twin, with 1910 engine, all accessories; £14, special bargain.

AMPSTEAD—1911 standard Triumph, 3 weeks old, condition almost new; £39, special bargain.

AMPSTEAD—2½ h.p. V.S., magneto, and spring forks, nice order, all accessories; £12.

AMPSTEAD—3½ h.p. B.S.A., condition and tyres like new, requires cylinder only; bargain, £7.

AMPSTEAD—1911 3½ h.p. Premier, almost new condition, with all accessories; special bargain

AMPSTEAD—1911 Bradbury, like new condition with accessories; a sidecar machine; £35, bargain

AMPSTEAD—3½ h.p. 1911 two-speed Humber almost new, with accessories; £45.

09 Triumph, free engine, had very careful use, just had new piston fitted, and thoroughly overhauled, in absolutely perfect condition; will take sidecar anywhere; a bargain, £39/10.—Braintree Motor Co.

UMPH, in splendid condition, magneto, h.b.c., recently had new cylinder, tyre, and belt fitted, and fully overhauled; first class, for £23 secures this bargain; any trial allowed; will send on up to 80 miles.—Braintree Motor Co.

11 Singer Moto-Velo, magneto, little used, in perfect condition; will ride machine up to 60 miles—pending purchaser's approval and trial; £25 only.—Braintree Motor Co.

OLF Lightweight, 1910 model, recently overhauled by makers, in perfect running order, a marvellous machine, takes any with 12 stone rider up, tyres, oil, and plating in splendid condition; £13/10.—Braintree Motor Co.

RGAIN—Powerful 6½ h.p. C.G. Twin, 1911, B. and B., 26x2; tyres, unpunctured, long handles, low, horn, spares, etc., excellent sidecar machine; £25, offer; buying lightweight. — 69, Greenside Rd., do.

X de Luxe, late 1909, 3½ h.p., Roc 2-speed, F.E., cantilever seat, Palmer cord and Dunlop, month's in thorough going order, with accessories; £24; at A.C.: evenings.—Alpe, 82, Lavenham Rd., South, S.W.

APHAM Junction—3½ h.p. Brown, magneto, Chater-Lea, in excellent order, spring forks, tyres nearly numerous spares; £25, or near.—Chandler, 6, The Gle, St. John's Hill, Clapham Junction. Tel.: 432, Ersea.

h.p. Fainir, 1911 Bosch, B. and B., Chater No. 6, stand, carrier, footrests, Whittle, adjustable, new tyres, perfect and reliable; £28; with the Chater sidecar, £33.—37, De Bennoir Sq., London N.

h.p. Premier, 1909, 2-speed gear, beautifully fitted up throughout, tyres splendid, Palmer back, comes with all accessories, lamp, generator, etc., ideal machine; £28.—Sydenham Autocar Co., 153, Lham Rd., Sydenham.

h.p. M.M.C., Chater No. 7, Palmers, new belt, adjustable h.b., spring forks, and nearly new engine, excellent condition, reason for selling, £15; also motor s, 20 in., £1; and Tee-bee seat-pillar, 2/6.—P. Wright, High St., West Norwood

Will Hill-climbs Survive?

AT the Newham Hill-climb we heard one or two prominent riders and officials venture the query as to whether hill-climbs will survive. At first we were rather concerned to hear such remarks, but we have had in view for some time the fact that hill-climbing competitions were becoming very stereotyped, and unlikely to be so popular in the future as they have been in the past. There are many reasons for this. One, no doubt, is the vexed question of a perfect, or rather an ideal, formula. Another is the difficulty experienced by the majority of private owner-riders in obtaining an efficiently tuned up machine, and still another is the comparative regularity with which some prominent riders win important events week after week.

Of course, our remarks do not apply to purely club events, where it is seldom that trade riders compete, but to the better known open events which have been popular up to now, and possibly will continue to be so while trade competition is keen, but which cannot fail to receive a certain amount of cold *douche* when things settle down. Although we have pointed out that the genuine private owner has some difficulty in obtaining a well tuned-up mount direct from the works on which to compete against trade riders, we know of several quite genuine amateurs who very much prefer to do their own tuning up, and in many instances this is quite equal, if not superior, to anything that can be turned out of the average motor cycle factory.

If readers would only take the trouble to analyse the lists of competitors in all the events which have been held during the last few months, they would find that, in the majority of cases, the same men compete in each event, and in many instances the same men

win. All credit to them for their performances, but the query that arose in the minds of the persons who referred to the survival or otherwise of hill-climbing competitions was how long would these competitions last without the particular support referred to.

As we have pointed out on many occasions, to stop racing and competitions generally means stagnation, but we think a good deal might be done to improve the ordinary hill-climbing competition. For instance, the same plan might be adopted as was pointed out last week in connection with the T.T. suggestions, viz., trade competitors might be called upon to compete on a machine selected by the committee of the organising club, such machines to be selected from the makers' stock and to be standard in every particular. The formula results might be improved upon, and it might be a somewhat sporting and at the same time instructive class if competitors were sent up the hill, with a certain fixed amount of petrol on each machine, according to its cubical capacity, and if the one who went the farthest were the winner. The petrol need not be poured into the ordinary tank, but could be filled into a special reservoir which would hold the exact amount required according to the cubical capacity of the engine. Clumsy riders who spilled their supply of spirit would, of course, finish low down the list, and big jets would be at a discount because they would prove too extravagant. After all, the use of a very large jet and an extraordinary amount of spirit in a hill-climb proves nothing, because the same machine if run for a considerable distance on the level and then taken up the same hill would probably fail through overheating, or if it did not fail from this cause it would be impossible to run the engine for long distances without constant valve grinding.

Our suggestion with regard to hill-climbing competitions is to make them more attractive another year by instituting something of the kind we suggest above. Of course, there may be other suggestions made which will be better than those we have formulated, and we shall be very pleased indeed to

publish our readers' views on the subject. Precedence will, of course, be given to novel suggestions for improving hill-climbing competitions, and in cases where it is possible for readers to do so we should like communications to be signed with their own names and not a *nom de plume*.

FORMULÆ FOR HILL-CLIMBS.

The large number of suggestions we have received with reference to hill-climbing formulæ shows that there is a very general desire for reform in this particular, and a dissatisfaction with the commonly used

formula $\frac{W}{C \times t}$. This formula certainly has its simplicity to recommend it, but its great fault is its assumption that the time is inversely proportional to the cubic capacity, and consequently to the horse-power, which every engineer, and most other people interested in the matter, know is not the case. The Eiffel Tower formula for air resistance is $P = .003 Av^2$ where P = pressure in lbs. per square foot, A = area in square feet, v = velocity in miles per hour, and .003 is a constant found by many experiments. This shows that air resistance alone varies as the square of the speed; and if this alone had to be con-

sidered Mr. Churchward's formula $\frac{W}{C \times t^2}$ would meet the case; it also has the merit of simplicity. There are, however, other points to consider. For instance, a rough road causes more vibration at a high speed, and everyone who has ridden any kind of bicycle knows how great an effect vibration has in reducing speed. Therefore it is obvious that is another factor favouring the small engine.

It is stated in *The Autocar* of August 26th that the power varies as the cube of the speed, in which case the formula suggested by Mr. R. Rüde, whose interesting letter we publish in this issue, will give the best results. His formula is $\frac{W}{H.P. \times t^3}$ (to give it in a slightly different form, but one which corresponds to

the other formulæ we have mentioned), or it may be

written $\frac{W}{C \times t^3}$, substituting cubic capacity for horse-power without altering its effect so long as it is allowed that horse-power varies as cubic capacity, in which case horse-power formulæ should contain the term D^2 or r^2 and S , but some horse-power formulæ do not, notably the Coventry and Warwickshire M.C. formula, published last week, which is combined with

$\frac{W}{H.P. \times t}$ for hill-climbing results.

The formula $\frac{W}{D^2 \times \sqrt{S \times N \times t^{1.5}}}$ combines the

essentials of the Coventry h.p. formula with $\frac{W}{C \times t^{1.5}}$; $t^{1.5}$ is inconvenient to calculate except with the slide rule or by logarithms, but, for the convenience of clubs, a table is published by the *Scottish Cyclist and Motor Cyclist* which gives the value of $t^{1.5}$ for all values of t from 30 to 200 (t is in all cases the time in seconds). This formula is used by the Edinburgh and District M.C. The Glasgow M.C. uses practically the same formula, but includes the gear in such a way that the higher the gear the better is the figure of merit.

If the A.C.U. is right in allowing a slightly larger capacity to multi-cylinder engines in the T.T. races on account of the increased friction, and it seems that the framers of classes for hill-climbs admit this by allowing twins of larger capacity to compete, then these same twins are at a disadvantage when it comes to calculating the results by formula.

THE CHAIN-DRIVEN MATCHLESS.

COLLIER & SONS, LTD., the makers of the Matchless motor bicycle, have introduced a new model which is chain driven instead of belt driven. The machine, which we have photographed, is the identical one used by C. R. Collier in the matches with Jake de Rosier, and on which he made his recent record rides of 90 miles an hour and over when belt driven.

The engine is a J.A.P., 90 mm. bore by 78.2 mm. stroke, Amac carburetter, Bosch magneto, handle-bar control. The chain drive is through the counter-shaft by means of two chains, the ratio from engine sprocket to counter-shaft being 2 to 1, and from counter-shaft to road wheel 20 to 26 teeth, giving a final gear ratio of $2\frac{3}{5}$ to 1. The counter-shaft is mounted on an eccentric strap, which allows the chains to be adjusted, and runs in two Hoffmann ball bearings. A frictional form of slipping clutch is fitted on the counter-shaft to soften the transmission of the chains, which would be otherwise too harsh. The machine is fitted with Hutchinson 26 by $2\frac{1}{4}$ in. tyres and enamelled red and gold lined.

Occasional Comments

By "Ilexion"

The Inestimable Value of the Speedometer.

I notice many riders still pursue the hobby without the aid of a speedometer, and of course three or four guineas is a considerable item in the season's bill. Nevertheless, motor cycling is twice as easy and twice as enjoyable with the aid of a speed recorder.

It is indispensable to the competition rider, for its readings tell him how he stands for both time and distance—the vital factors in the modern trial. It is equally indispensable to the private tourist, for it affords valuable information about engine tune, petrol consumption, state of one's tanks, and so on, besides guarding him against slowing down too little for a bad corner after a burst at high speed.

Nothing is more deceptive than dropping the pace after a sprint; the machine is invariably travelling much faster than one fancies, and most of the accidents at corners are due to this deception.

Moreover, the modern speedometer is all but perfect. If it is periodically returned to the makers for re-calibration, its reports may be trusted, and its worst fault is to exaggerate the pace a trifle at high speeds when it gets worn—a fault that tickles a rider's self-esteem.

No trouble need be apprehended other than a broken driving-shaft or sheath, and these are almost invariably due to neglect of the makers' instructions about fitting.

Leaning Out Round Corners.

Probably a host of riders have experimented with the "new" method of taking corners, which received such a lot of press notice after the 1910 T.T. Race—I refer to the practice of leaning the machine in and the body out when negotiating a corner at speed. At the time I personally had no great belief in it, but a year's practice has rather modified my views, and to-day I am inclined to believe that any given corner is negotiable at a higher speed by this method than by the old method of leaning both machine and body in the same direction. Anyhow if I ever come upon a bad corner unawares, and feel a trifle dubious about getting round, I always tilt the machine inwards and lean my body in the reverse direction.

Incidentally I have discovered one merit in the leaning out which none of its advocates have referred to in print, and that is, it enables the rider to see farther round a blind corner. Imagine that a motor cyclist in a hurry is suddenly confronted with a blind corner. If he leans his body in, his head gets well under the lee of the hedge or wall, and he only enjoys a very restricted outlook round the bend; but if he leans his body out, he almost destroys the "blindness" of the corner, and can see right round it before his machine has taken the bend.

The difference in vision may not be great, but it is sufficient to improve the chances of avoiding a smash when a partial error in judgment has been made; and if for this reason alone, the "leaning out" method

is worth cultivation. Of course, your really sensible rider never takes a blind corner at speed; but most of us suffer from temporary mental aberrations—in such moments, my advice is lean out!

Handle-bar Fitment Clips.

There is still much room for improvement in the clips sold for attaching accessories to the handle-bars. Lamps remain about the only "extra" provided with really rigid clips, and even these are seldom interchangeable on every make of machine. Why do some makers continue to pierce lamp irons? There is nothing in it, and the majority of lamps have a set-screw fastening which will not hold on pierced iron. I have a lamp which cost me about three guineas, and, to do it justice, no part of it ever comes adrift. But if I want to remove the lamp, I have also to remove the entire clip, which consists of nearly twenty pieces. Why is it not designed so that the lamp and generator can be removed by undoing a couple of nuts, leaving the clip *in situ* on the bar?

Hooters are still abominable in this respect, in spite of all our grumbling. Going round the Clarendon Yard at Harrogate, I noticed that few hooters were rigid except those which were lashed with straps or wire; and we all know how, if you screw up some hooter clips really tight, the head twists off the bolt. One or two British-made horns are very much superior to the foreign clips in this respect. I find a good plan is to drill and tap both clip and bar and put a screw through the two. This, in addition to the usual screws, will prevent loss of the horn.

Speedometers shed their bolts exhaust whistles drop their screws, which is not surprising when two or three fine threads have to withstand the pressure of a strong return spring, and there is no lock whatever on the miniature bolt. The carburettor control is almost the only handle-bar detail you can expect to find rigid after a gruelling ride.

P. Brewster (4 h.p. Norton) about to make an ascent of Newnham Hill in Class 3 of the Coventry and Warwickshire M.C. hill-climb.

A New Method of Mending Punctures.

THE Parsons Rapid Repair Kit, sold by the Parsons Non-skid Co., 23, Store Street, Tottenham Court Road, London, W.C., although primarily intended for use with car tyres, is, nevertheless, equally applicable for the relief of smaller tube troubles, and as these are the greatest bugbear from which motor cyclists suffer—a greater bugbear even than they are to car drivers—the description of a new method of repairing punctures cannot fail to be of interest. The great point about the Parsons process, to my mind, is that there is no messy solution, and hence no waiting whatever. The repair made is in almost every respect as lasting a one as vulcanisation, and made, moreover, without the slightest risk of damage to a valuable tube. Unlike most solutioned patches, no amount of heat can ever loosen the Parsons patch, and this fact has caused me to give it my most unqualified blessings during the recent very hot weather. It is a great thing to be able to mend a puncture and be off again in five minutes with clean hands and the secure assurance that that repair at all events will give no further trouble.

The outfit consists of four tools, put up in a neat leather case. The first, which is shown in fig. 1, consists of a cutter.

Fig. 1.—The Parsons cutter.

The puncture having been located, the point of this tool is thrust through the tube until the latter drops into the circular groove, as indicated in the dotted lines. The handle of the tool is held with one hand, whilst with the other the milled nut is screwed towards the spear point. This milled nut carries a tubular knife, which, with the aid of the square back edge of the spear point, cuts an absolutely clean, round hole, about $\frac{3}{8}$ in. in diameter, in the tube. Thus the punctured part of the rubber is completely removed. The cutter having been removed—its operation having been the matter of a very few seconds—the tool shown in fig. 2 is introduced. This is a spreader, the jaws of which, when closed, are pushed into the hole made by the cutter, and are then forced apart by hand pressure. The function of this tool is to stretch what was first a round hole into a slit about $\frac{1}{2}$ in. in length. Owing to the original hole being perfectly circular and with smooth edges, there is no risk whatever of the tube splitting, if it be made of good rubber. The next tool to come into use is the patch itself, which takes the form of a button, shown both in perspective and section in fig. 3. This stud

is thrust through the spread hole, and, when in position, the spreading tool is withdrawn, this operation—like the cutting process—only taking a very few

Fig. 2.—The spreader in action.

seconds to perform. The button itself consists of a spun brass skeleton, surrounded, as shown, by a thick coating of vulcanised rubber. It measures some $\frac{1}{2}$ in. in diameter, and, before squashing, about $\frac{1}{4}$ in. in thickness. It will be noticed from the section of the button that the top and bottom parts are furnished with corrugations which correspond with one another, and hence when the head and base of the button—which is really a form of rivet—are closed together under pressure, the joint between the button and the tube is a very intimate one. When it is squeezed up the central tubular column between the head and the base collapses, and spreads outwards, thus forcing the tube tighter and tighter into the corrugations of the button.

The tool with which the squashing of the rivet is accomplished consists of a pair of pliers with a parallel motion, as shown in fig. 4. The jaws are provided with hollowed-out discs, which exactly fit the ends of the button, and ensure its being crushed down evenly all round. The button being loosely inserted into the tube, it is twisted around once or twice to make certain that it has been inserted fairly and squarely, and the tube is then flattened and placed between the jaws of the pliers, care being taken that the base of the rivet, which is inside the tube, lies squarely—the opposite wall of the tube, of course, intervening—on its hollowed disc. The pliers are then grasped firmly

Fig. 3.—Sketch and section of button.

and squeezed until the rivet can be felt to collapse. No Herculean strength is required for this operation, a firm, slow pressure being all that is necessary. After this has been done, the tube is turned round, and the rivet again squeezed tightly, but from the opposite side. This second squeezing is done in order to ensure the heads being squeezed together uniformly. The cutting, the spreading, the inserting of the button, and the final

squeezing of the same, complete the whole operation; and with a little practice it occurs from start to finish less than a minute. Once the button is squeezed up it is there for "keeps," although it can, as a matter of fact, be got off if required. The buttons, when securely squeezed home, do not permit a leakage. The only precaution which is necessary for keeping them in the best condition is to avoid severely stretching the tube in their immediate vicinity.

During the past three weeks I have had the pleasure—and, indeed, it is a pleasure—of mending something like a dozen punctures with the Parsons kit; and an old tube, in which five previously applied solutioned patches have been replaced with buttons, has stood up for close upon 1,000 miles, in spite of the heat occasioned by a steel-studded cover on a sidecar machine. I recently took the tube out, after more than 700 miles, and found it to be as airtight as if it were new; and, as far as I am able to see, there is not the slightest sign of the heads of the buttons having wrought any effect whatsoever on the fabric lining of the cover.

A few days ago I was able to give the new process of repair an extremely arduous test, in which my expectations were that

Fig. 4.—Compressing the button.

it could scarcely be hoped to succeed. A badly worn front cover allowed the tube to burst, the burst being a slit nearly half an inch in length. I well knew that in such circumstances the Parsons kit was scarcely intended to be applied, but I determined to see what it would do. Accordingly the cutting tool was used to make a single round hole in the middle of the split, and another one on each end, running into the middle one, of course, to prevent the split enlarging under the spreading tool. This meant that the head of the button only overlapped the hole by about $\frac{1}{4}$ in. each side. It was accordingly inserted, squeezed up as tightly as possible, and the tube replaced and the cover strengthened by an unsolutioned plaster. Contrary to my expectations, the tube has held up perfectly for over four hundred miles, and I have no doubt it will continue to do so indefinitely. The complete repair occupied scarcely ten minutes between stopping and getting under way again, and it is this saving of time which makes the Parsons repair kit such a very valuable accessory.

The only difficulty that occurs to me would be the mending of a puncture that unfortunately happened to be close to a previously affixed button, for in this case the two buttons would overlap and it would be difficult, if not impossible, to fix the second one satisfactorily so as to make an airtight joint, and it would be needful to remove the button and cover both holes with a patch. W.G.A.

500 MILES ON A SIX-SPEED.

By B. H. DAVIES.

AFTER ten years of playing the pelican in the wilderness by raising an almost solitary voice in clamour for variable gears, it is almost embarrassing to have a six-speed machine put at one's disposal; and the six-speed Rudge is more than a six-speed; it is really an infinitely variable, for the number of ratios is limited only by the quantity of notches the makers choose to cut in the quadrant. There are six and no more, because the makers see no useful purpose in providing more. The machine which Victor Holroyd placed at my disposal was one of the original T.T. set, and was more of a projectile than a vehicle. Seldom have I felt such a "yank" under my saddle when giving a single-cylinder engine the liberal throttle; its acceleration was remarkable, and I soon learnt to start up with the throttle lever close back against the bar, for otherwise the machine was likely to be many yards off before I sought the saddle. It is already out of date, for giant strides are being made with the perfection of the gear for next year. The wide projecting quadrant is being scrapped, together with the huge pitchfork lever, the back wheel is being lightened, a free engine has been incorporated, and the dummy braking belt rim will disappear. As I was riding a primitive pattern, rushed through from the designer's brain to the Glen Helen depot within ten days, I was without these refinements, and the first tip I picked up on the road was to lower the gear before I stopped; for you cannot alter the gear of the early type when the machine is stationary, and starting on a 3 to 1 top ratio is sometimes exhausting. As it happened, I had to get down to Torquay and back from the Midlands within forty-eight hours, and with sundry detours the distance panned out at about 500 miles. Until some of the outlaws have ceased to rampage, I dare not publish my speed. I will only say that, judging from my experiences, this machine should have a good chance of smashing the End-to-end record, should it ever start on that lonely and illegal jaunt. I took the route *via* Oxford, Newbury, Salisbury, and Exeter, returning by the coast road; and such hills as Chard, Yarcombe, Haldon, Trow, Lyme Regis, and the short fierce pimples around

Newbury soon brought the merits of the gear into high relief. I confess that before my ride I saw little use in six ratios separated by such small divergences, but I soon learnt on the road that the drop from, say, a 4½ to a 5 gear is of infinite pleasantness. On the 4½ your engine feels "on the collar," and is apt to labour a trifle on a hill which is fractionally steep for its compass. Drop the gear only ten per cent., and the engine hums smoothly and easily, with vast suggestions of mastery. No! I now consider a two-speed gear, such as I have on my own Rudge, hopelessly out of date. Why run slowly with a racing engine on a fifty per cent. drop, when a multiple gear enables both back wheel and engine to skim smoothly?

Punctures in spite of Precautions.

The journey to and from Torquay was absolutely devoid of incident, except for tyre troubles; and if I had not been concentrated upon appreciations of the gear, the ride would actually have been dull. That tyre trouble deserves some mention, for it was unexpected. Figure to yourself, gentle reader, the six-speed was shod for the T.T. Its wheels boasted brand new "special" T.T. covers, of the heavy, non-skid type. Within each reposed a long, red, snaky, "puncture-proof" band, and below that again lay a self-sealing tube. It seemed otiose to carry a pump or an outfit. Yet several punctures befell me, in particular a large nail, which tore a huge scraggly hole in the cover, and made five several rips in the tube. Picture me, seated by the roadside with Patch-quick in one hand and a cup of tea from a hospitable Somersetshire hob in the other, thoroughly enjoying myself; then blinding on again to Torquay through the darkening lanes, and back again northwards, with rosy dreams of a perfected Rudge six-speed for my ordinary riding in 1912. Two notes about the Rudge, and I have done: Its engine never needs injections—you can always start it straight away from cold; and the comparatively small Vandervell magneto has a wonderful trick of starting with the ignition lever well back, if you time its retard a shade below the dead centre, instead of on the dead centre, as its makers recommend.

MANCHESTER M.C. GYMKHANA.

The motor cycle and mouse-trap race, in which riders had to ride along the track, set a mouse-trap and return to the finishing point.

The cigarette race. Each competitor had to ride to the end of the field where ladies were ready to light their cigarettes.

Variable Gears and Motor Cycles.

I.—POSITION.

WHICH is the best position for a change-speed gear? is a question one frequently hears, and there is great diversity of opinion on the subject.

There are three positions in which variable gears can be placed on motor cycles, each having certain advantages and disadvantages of its own, and it is the purpose of this article shortly to consider these positions, and decide, if possible, which is best.

They are as follows:

- A. On crankshaft (as N.S.U., Fitall, etc.)
- B. In back hub (as Roc, Armstrong, etc.)
- C. On a counter-shaft: (1) Between the engine and back wheel (as P. and M., Indian, Enfield, Scott, etc.); (2) in front of engine (as Griffin-Simplex) or below it (as Douglas).

With a belt drive any of these positions is admissible. A scores in point of simplicity, the ease with which it can be fitted to existing machines, and lightness; for the speed, being high, the pinions and gear wheels can be made lighter than those of a gear intended to be fitted in another position. Against these advantages must be placed the following drawbacks: (1) The overhanging weight on the engine-shaft, and (2) the fact that on the low gear the belt speed is reduced, which is most undesirable. The first of these disadvantages may be negated by having an outside bearing, but this adds complication. All gears which are worked on the expanding pulley principle must of necessity be of type A, and the belts must suffer accordingly.

Hub Gears and their Advantages.

Hub gears (type B) are used with considerable success on many motor cycles, the Roc gear having done much to popularise this type. They have the advantage of keeping the belt speed more or less constant, but they must be heavier in build than type A, and they add a certain amount of unsprung weight to the rear wheel, which is not desirable. Both these types are made on the epicyclic or compound principle (about which more anon), and admit of a single belt drive, which is an undoubted advantage.

They can also be used on chain-driven machines with the addition of a counter-shaft between the engine and the back wheel; but when a counter-shaft is fitted, it seems more reasonable to place the gear in that position, and not to encumber the engine with extra

fittings and a possibility of end thrust on its bearings, which are not made to withstand it, or to add weight to the back wheel.

Types C (1 and 2) are suited to a combination of belt and chain drive—an excellent combination, too, and one which has done well in recent trials. Other things being equal the belt will have the best grip when the counter-shaft is in front of the engine, but if the pulley is made as large as possible and the size of the belt rim not reduced (which practice is not to be recommended), the grip will be quite as good when the counter-shaft is placed behind the engine as in the case of a direct belt drive, and the life of the belt will be much longer, as it will not have to bend over a small pulley, and a larger part of its surface will always be in contact with the pulley.

Counter-shaft Gears Increasing in Popularity.

For chain-driven machines the type C (1) is preferable, whether the change of gear is made by a selective clutch as used on the Enfield and P. and M. machines, or a counter-shaft gear is fitted, as on the Indian and A.J.S. motor cycles.

There is no doubt about the present popularity of variable gears, and it is certain that, as time goes on, they will be fitted more and more to standard patterns, and type C is that which is likely to be most common. It is now an open secret that the Triumph, Singer, and Bradbury companies are experimenting with a gear on these lines for 1912. It does not reduce belt speed on the high gear, although the angular velocity of the pulley is reduced, or increase the weight of the back wheel, and it is well placed as far as the general distribution of weight is concerned, its only disadvantage being the slight added friction of the counter-shaft. It is suitable for a combination of gear and belt or gear and chain, as well as for the drives mentioned.

Shortly, then, A is most easily fitted to existing machines, B does not decrease the belt speed, and both allow of the simplicity of a simple belt drive, but C is the most desirable type to build into new machines, and is, I believe, the type of the future.

The popularity of variable gears is clearly shown by the fact that out of seventy-seven starters in the 1,000 miles trials, fifty-nine had variable gears, and of these fifty-nine, fifty-one finished and gained thirty gold medals out of the thirty-three awarded.

(To be continued.) AURIGA.

Variable gears suitable for crankshaft, counter-shaft, and hub.

THE TRADE AND THE TRIALS.

THE recent article in this journal concerning likely action of the Manufacturers' Union with regard to the T.T. races again brings forward the oft-bated problem of the trade *versus* trials and races. Coupled with the boycotting of the Quarterly Trials its latest development presages intention to withdraw support from all competitions which aid development of machine, design, or construction; at least, that is how the matter appeals to the average amateur, who knows nothing of the reasons guiding a policy that may meet with approval from the majority of manufacturing companies. The trade, through its Union, has every right to express opinion and act accordingly, but there is the equally important private owners' opinion, which the writer attempts to summarise.

Without wishing to shower too much praise on the Cycle Union, recognition cannot be refused of the splendid service that organisation has rendered to the industry. Before the A.C.U. came into being, makers could only arouse interest by track races—a form of contest that produced fine results for pedal cycles, but certainly did not, in the early days, bring access to mechanically-propelled cycles, judging from what happened to those firms who, in the past, based their claims for support solely upon a track-racing campaign.

The A.C.U. to the Rescue.

Right at the commencement of its career, the A.C.U. altered this unsatisfactory state of affairs by promoting the 1,000 Miles Trials in 1903. Those firms who gained the coveted certificates quickly discovered that prospective purchasers attached much more importance to an *officially* conducted road test than to track races put together. Machines were in the analysis stage of evolution, developments and improvements were published almost weekly, and new firms were endeavouring to secure a share of the business.

For four years the Six Days' Trial was the only means through which makers were able to prove the merits of new ideas, but the interval between each of these events had to be bridged by a less strenuous and less costly trial for bringing to public notice fresh designs from established firms or the productions of unknown makers. Thus the Quarterly Trials were organised, and although their value was not at first realised by the industry, the few firms supporting the early series were so well rewarded in the shape of instant orders that other firms entered, and all benefited from mutual competition. Entries increased until they culminated in October, 1910.

Will the Quarterlies Survive?

The standard argument against continuance of the Quarterly Trials suggests the modern motor cycle is so reliable that any novice can easily accomplish the test set for drivers in traversing some 125 to 150 miles of road at legal limit speed. This is a point upon which opinion differs, but if the claim for perfect reliability is investigated, it is not confirmed by facts. Of the sixteen events conducted from 1907 to the end of 1910 were all held over the same 125 miles route, along nearly level roads, and including only two very small hills. In the first event, twenty-five per cent.

made non-stop runs, and in the last 1910 event in October twenty-eight per cent. made non-stops. Can any reasonable man declare that these figures prove increased reliability? On the last mentioned occasion rainstorms were experienced, with consequent heavy roads, but as weather is not supposed to affect the modern machine, it ought theoretically to be neglected in considering results. Practice tells a different tale, and those folk who followed the October trials last year know how bad weather contributed towards the poor show made by some of the most expert motor cycle riders in England.

Whatever may be the policy for 1912, a number of manufacturers have consistently abstained from the 1911 Quarterlies, and, for all that is known to the contrary, may desire to keep aloof hereafter. But what about new firms and those who have not entered machines before in these trials? Are the smaller makers (who may not be able to afford the expense of the Six Days' Trial) in agreement with a policy that will prevent them obtaining the hallmark of a certificate? If such pronouncement is agreed upon, new machines and new devices would have to await the big event each year, and so lose all the best selling months before being able to claim an official award.

Many waverers, who held no settled convictions one way or the other, were possibly influenced against entering this year by the specious argument of expense. The writer confidently asserts that if each Quarterly Trial cost every trade entrant ten or twenty times the present outlay, it would be well worth the lever for publicity so secured. After every trial British manufacturers and foreign agents announce victories by boldly-worded advertisements. The average motor cyclist is keenly critical, and appeals of this character would be wasted money unless the A.C.U. certificates were universally recognised as carrying authority. This has never been questioned by the trade or the public, consequently sales are directly traceable to the gaining of awards.

The Cost of the Trials.

On the score of expense, the smallest firm employs at least one "road tester" whose services can be requisitioned for reliability trials, open hill-climbs, and other contests. The Quarterly Trial occupies one day, and another day will be spent in reaching the starting point and returning home. Reckoning entry fee, driver's time, two nights' hotel expenses, and sundries, the maximum cost cannot exceed £3 10s. per event, or £14 a year. Place this small figure alongside what is spent by some firms in sending one, two, or more riders to the open hill-climbs in distant parts of the kingdom that take place every week during the summer. Why, much more than £10 is often spent by one firm upon one open hill-climb, so if expense is brought forward as an argument for barring an event which brings grist to the manufacturer's mill it is easily refuted.

The points above outlined are, however, of minor importance when we come to consider the broad question of consistent trade policy. Whether any firm shall, or shall not, take part in competitions concerns only individual management, and can be whittled down to the simple problem of pounds,

The Trade and the Trials—

shillings, and pence. Members of the motor and pedal cycle industries have inaugurated an exhibition policy, in which conflicting interests are hardly likely to arise, and conducted along the sage lines hitherto followed, there appears sound reason for believing that the future of the annual Show promoted by the Manufacturers' Union is permanently assured.

Work for the Manufacturers' Union.

There are plenty of other vitally important matters, such as railway rates, customs, etc., upon which energy can be centred, but when attempts are made to fetter the freedom of individual firms, friction becomes inevitable, good feeling is destroyed, and the malcontents thus created will find ample excuse for breaking away.

Nor must the general effect be overlooked in relation to retail purchasers, who naturally connect the rumours about abstention from the T.T. races with the boycotting resolution agreed to by the manufacturers in respect to the Quarterly Trials on the 10th of January, 1911. Already wild statements are in the air about fear of competition, desire to stereo-type design, and similar remarks. Men acquainted with the leaders of the M.U. know there is not the slightest foundation for these rumours, yet they cannot be ignored, and unless straightaway negatived will create unnecessary prejudice against firms hitherto recognised as being beyond the reach of baseless chatter. Each firm or company only can work out its own salvation. Whenever a manufacturer discovers that competitions are not remunerative he will cease to enter, others will follow suit, and redundant contests will cease through natural evolution. UNBIASED.

The Margin of Safety in Sidecars.

RECENT record performances have brought to light one or two very interesting details in connection with sidecar manufacture, and these items should be carefully considered by those who are interested in these machines. In all probability it will be some time before the handy sidecar vehicle is superseded, and while it remains so popular it is the duty, and we think in the majority of instances the pleasure, of those who are interested in them to improve the manufacture both from the point of view of reliability and comfort.

From information we have before us we think that the axles in some cases are barely strong enough. That is to say, when subjected to very fast work on rough ground with a fairly heavy passenger they have been known to give way. It should, however, be impossible for such a thing to occur. The margin of safety should be enough to prevent it. The real trouble is that the axle is only supported at one end, and the reason the standard axles of motor bicycles are sufficiently strong is because they are supported at each end. Were they made like a stub axle on a sidecar they would have to be immensely stouter.

Spring Forks.

The spring fork on a motor bicycle is another item which requires attention when the machine is used with a sidecar. Anything in the nature of lateral instability is subjected to considerably more strain than it is easy for it to bear, and in consequence joints which stand quite well for solo work give way or wear rapidly under the extra strain of a sidecar and passenger.

For these reasons it looks as though the luxurious sidecar combination will eventually become more or less of a fixture. That is to say, it will not be a machine that is sold for a dual purpose, but the sidecar user will buy a machine which is specially constructed for sidecar work, and although he may occasionally use it for solo work it will not be so well fitted to the latter as the former.

For instance, every sidecar machine ought to have a variable gear of some sort and larger tyres than are used for solo work. The parts mentioned above should be stronger, and were it possible a sprung frame would

be advantageous, although not by any means essential. There is, however, a considerable amount of extra vibration or road shock transmitted to the rider of a bicycle when a sidecar is used. This is partly due to the two tracks and the peculiar construction of the machine, and is also due, we think, to the slower speed. Our experience shows that at thirty miles an hour on a solo machine there is considerably less shock to the system than when covering the ground at ten miles less speed on a sidecar. Some riders say that with a rigid type sidecar combination this is due to the fact that at high speed one bridges the obstructions and they are not felt, whereas at lower speeds the small diameter wheels have time to enter and leave the various pot-holes to be found on our main roads, subjecting the rider at the same time to a considerable amount of shock. This is, of course, quite a vague theory, but it appears to have some reasonable ground for belief.

Power Required.

From the point of view of comfort, as we have explained in various articles that have been published before, a considerable amount of improvement can be made, more particularly in the case of handy little attachments for carrying spares and tools and provision for the comfort of the passenger. We hope to see at the Show some very luxurious forms of sidecar combinations, and we do not think from what we know that we and our readers will be disappointed in those hopes. All tendency to produce projectiles on the lines of the old 10 and 12 h.p. tricars should be wisely but firmly suppressed, but we should not like to say that the $3\frac{1}{2}$ h.p. or 500 c.c. engine is a definite standard or likely to become so for sidecar work. There are so many 5 to 8 h.p. twins on the market doing good sidecar service that probably in the neighbourhood of 5 to 6 actual h.p. will be found sufficient, but whether it will be done with a multi- or single-cylinder type of engine is a matter for conjecture.

Our personal choice at present leans towards a single-cylinder as being the least trouble to keep in order, but for those who have a fair amount of spare time and desire the greatest luxury, of course a multi-cylinder engine will be the choice.

LISTEN—and you will hear!

In "The Motor Cycle" of Sept. 7th, 1911, "IXION" states, after careful collaboration with riders, pressmen, and others, that the severest trials ever held were the SCOTTISH Six Days of 1910.

5 Gold Medals in 5 Events in one week.

Nottingham, August 18th, 1911.

"You will be interested to know that last week in two race meetings, our Mr. George Brough obtained 5 first awards on his 6 h.p. Brough. His machine was, of course, fitted with Simms Magneto, and it says something for the Magneto, that he should be enabled to enter 5 events in one week and win the lot.

Details:—Chesterfield Hill Climb. 3 Gold Medals. Nottingham and District Speed trials at Clipstone. First in unlimited class, first in flying mile. Speed over 75 miles per hour." (Signed) W. E. Brough & Co.

The "CLIPPER" Rubber - Studded Motor Cycle Tyre.

Motor cycling is very much what you make it. To use tyres of inferior quality is to ask for trouble, and reduces the pastime to mere vexation.

To prevent such a possibility, go in for THE CLIPPER RUBBER-STUDDED TYRE, which is specially designed to render substantial service at a medium cost.

Note the rubber studs which make side-slip well nigh impossible, besides doubling the wearing capabilities of the tread.

"Clipper" Rubber-Studded
Motor Cycle Tyre.

Price of Tyre	£1 16 8
Price of Cover	1 6 8
Price of Tube	10 0

S

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

An Appreciation.

[5870.]—I shall be glad if you will allow me a little of your valuable space to thank publicly Messrs. Rudge-Whitworth, Ltd., for their thoughtful kindness since the fatal accident to my son, Mr. Victor J. Surridge. Every member of the firm from the managing director downwards has done all in his power to soften the blow. On the financial side the directors have acted handsomely; in fact, in excess of their legal liability.

JOHN SURRIDGE.

Variable Gears in Hill-climbs.

[5871.]—I am again obliged to you for publishing my letter on this subject, but I must again point out that your editorial note, though true in fact, conveys an erroneous impression.

If the variably geared machine was properly catered for, the number of entries would have been very different. The single and twin riders naturally resented being thrown together, and the fact that Zenith-Gradua machines were barred from the ordinary classes made the riders stand out altogether from the event.

If our machines had been treated properly in this event I know many private owners who would have entered, and there would have been all the entries from my firm.

I quite agree that the inference to be drawn is that barring Zeniths encouraged entries.

The reason for deleting the passenger class as given is that the club wanted to cut down the classes, but I would remind you that it afterwards added another class for "freaks," so that the desire to cut down the classes cannot have been very strong. Why seven classes should be deemed too many I cannot understand, as the arrangements in 1910 were so perfect that the events were all over very early, and I still retain my impression that other causes influenced the decision.

ZENITH MOTORS, LTD..

W. G. BOWER.

Silence.

[5872.]—There can be no doubt that a great deal of prejudice exists among the general public against motor bicycles owing to the excessive noise they make. I first had a machine early in 1902 with a 2½ h.p. De Dion engine (a powerful machine then), and I don't think it made as much noise as many machines do now. I made a silencer about 4in. by 6in. and suspended it from the back wheel chain stays on the right-hand side. It perhaps didn't improve the machine's looks, but it was a big silencer, and kept the engine very fairly silent. I live close to the London-Exeter Road, and lots of machines pass here daily, and they make infinitely more noise than the cars. The car manufacturers have improved their products wonderfully in this direction. Surely the motor cycle manufacturers can do the same.

The craze for very fast machines which the car people have now lived down seems very bad in the motor cycle world, and no doubt this leads to noisy machines. The valves of most motor cycles are very noisy—the car people have silenced these. Again cut-outs are abominably misused by motor cyclists who associate noise with power I suppose, caring not a "hang" for anybody whom they may annoy as they pass. Let one of these gentlemen have to lie ill in bed for a week or two and then he would realise the real agony these unnecessary noises cause to sick people.

If I had the power I would far rather fine a man £10 for driving near a town or village with a cut-out open than for going thirty miles an hour. I would give him hard labour without the option.

A QUIET PERSON.

Formulae for Hill-climbs.

[5873.]—Re formula for speed trials or hill-climbs, it is well-known that the often used formula $\frac{H.P. \times t}{w}$ (to put it this way) is a very poor one, for it asks no more than twice the horse-power for half the time. I, therefore, thought it might interest you to hear of a new formula which has been used with great success, i.e., $C = t \sqrt[3]{\frac{H.P.}{w}}$.

C really means constant, and so it should be for all given horse-powers and weights. The formula is nothing else but a handicap, and if the more powerful or lighter machines are well handicapped the figure of merit should be the same in each case.

That this very nearly is so I will show later, and only wish to point out that, instead of the horse-power, the cubic capacity may also be taken and the weight of machine and rider as *w* in lbs., although it is better to work with H.P. and weight in tons on account of $\sqrt[3]{\frac{H.P.}{w}}$. The horse-power should be determined by $H.P. = 6 \times D^2 \times S$.

D = diameter in decimetres.

S = stroke in decimetres.

t = time in seconds.

w = total weight of machine + rider in tons.

e.g., $6 \times .85^2 \times .88 = 3.7$ H.P.

In the following table *t* is time per mile, and it can be seen from the results that the figure of merit is quite different from the old formula, where more powerful machines are nowhere:

<i>t</i>	H.P.	10 lbs.	Tons.	$\sqrt[3]{\frac{H.P.}{w}}$	C.	<i>t</i> × $\frac{H.P.}{w}$	$t^2 \sqrt[3]{\frac{H.P.}{w}}$
6.0	2½	130 + 180 = 0.14	2.66	3.2	23.6	5.3	
6.0	2½	140 + 180 = 0.145	2.53	3.37	20.7	5.42	
6.0	3	150 + 180 = 0.15	2.72	3.26	24	5.36	
6.0	3.8	165 + 180 = 0.156	2.9	3.22	27.1	5.49	
6.0	5	165 + 180 = 0.156	3.18	3.42	34.3	6.06	
6.0	6	220 + 180 = 0.182	3.21	3.21	33	5.74	

The Motor Cycle just to hand shows that also on the other side of the world a better formula has been found and used than the obsolete one.

$C = t \sqrt[3]{\frac{H.P.}{w}}$ may also be used in a form $\frac{H.P.}{w} t^3$ as against

$\frac{H.P.}{w} t^2$ of Mr. Churchward. The latter figure of merit favours slightly the lightweight, as shown above in the last column.

Trusting that you, Mr. Editor, may find space to publish the above, which figures are easily worked out by slide rule,

Berlin.

R. RÜDE.

Scorching.

[5874.]—I trust that you will kindly allow me space to answer Mr. B. H. Davies, since he has made several assertions proving that he is not aware of the circumstances under which a modern End-to-end record is made. I am pleased to observe that he admits that he frequently drives in excess of legal limit; this, of course, was never in doubt, as anyone who has seen the reports of the Scottish and Six Days' trials will agree.

I would also state that a testimonial signed by himself in the Riley Cycle Co.'s motor car catalogue contains the following sentence: "I have had no difficulty in averaging 30 m.p.h. all day with t over ordinary runs, even when it is slowed down for all traffic, cross-roads, villages, etc." These notes I commend to the notice of the A.C.U.

Now with regard to his views of the End-to-end record. During my last ride, I rode 450 miles absolutely alone, and

at no time had I more than two men with me; the only occasion on which I was accompanied by two was forty miles south of Gloucester, otherwise I was only accompanied by one man who rode behind quite 200 yards in the rear. I would also point out that I averaged under 31 m.p.h., and so far from being exhausted, I walked over twelve miles after finishing the End-to-end between Land's End and Penzance. As to "blinding" through villages, this would be an extremely foolish policy, as I was ahead of record, and would naturally not wish to jeopardise my chance of success.

If Mr. Davies will carefully look up my figures, he will see that I made the record safe with ordinary luck before ten o'clock in the morning, at a time of day when Scotland is absolutely deserted. I have helped in several End-to-ends during the last three years, and to my mind an accident at high speed is just as likely to happen when high-speed is indulged in over a distance of 100, 200, or 900 miles. It was with the express intention of reducing risk that I discouraged followers both this year and in 1909. Whilst I do not wish in any way to defend my action in defying the A.C.U., whose sentence is perfectly just, I am still of the opinion that it was very unwise of Mr. Davies to state that he averaged a trifle in excess of End-to-end record pace from Northampton to Torquay—see page 885, August 24th. No doubt the public will be able to judge for themselves, and I am quite content to leave it at that.

Mr. B. H. Davies, to my certain knowledge, has never seen me riding on an End-to-end record, and therefore has no reason to state that I have taken undue risk with regard to the public.

IVAN B. HART-DAVIES.

Exhaust Pipes, Spring Forks, and Piston Rings.

[5875.]-I am a constant reader of your extremely interesting paper, and being an engineer by profession, may I offer my opinion on two matters which I have noted in your paper and a little additional experience regarding a third?

1. *Re increased power of engine with cut-out closed.* Mr. A. D. E. Craig is quite correct in his surmise regarding the suction effect of a long exhaust pipe: in fact, this point is always aimed at in gas engine plants with a view to obtaining a good scavenging action as well as reducing back pressure, due consideration being given to the length of exhaust, as if made too long it will simply create back pressure instead of a negative pressure, and this may explain the reason why with cut-out open a loss of power is noticed, the loss depending on the proximity of the cut-out to the silencer.

2. Is there not the risk and danger of the front wheel fouling the top of the forks in the new design of spring forks, described in your issue of the 31st ult., if a severe jar were received, as it appears the wheel moves relatively to the forks or *vice versa*?

3. As regards broken piston rings disappearing, I have known cases of studs $\frac{3}{16}$ in. diameter by 1 in. long which were in the ring of a large piston 72 in. diameter, having worked loose and fallen into the space between the piston and piston ring, being reduced to spheres of the size of marbles, and, in some cases, to disappear completely on account of the pounding action due to reciprocation, and this, I think, takes place in a petrol motor, and I have no doubt that if the crank case oil were carefully examined some traces of a steely nature would be found.

ENGINEER.

A Hyperborean Protest.

[5876.]-Lies have been divided into "lies, d—d lies, and statistics." The catalogues of practically every motor cycle firm smack and smell of all three. Is it fair, sir, apart from truth, to try to persuade men that a $3\frac{1}{2}$ h.p. motor will take a sidecar and passenger anywhere? I live on the borders of the counties of Aberdeen and Banff. The gradients of our second-class roads often rise for six, eight, and ten miles at a stretch. The surface is often bad, and the wind often enough a gale. There is not a $3\frac{1}{2}$ h.p. on the market—not even that princess among climbers, the Zenith-Gradua—that can take a sidecar and passenger, month in and month out, over our hills in the North. An odd run once in a way may be a sporting success. Men like Gibson and Wray may do the End-to-end journey, but pray, sir, what is their united weight? Not much more, I suspect, than that of one biggish girl or average man. [Mr. Gibson is a fair average weight. We do not know the exact combined weight, but should say it is about 22 stones.—Ed.] Such sporting feats by experts are entirely illusory as indicating the type of machine for a mountainous district. No, sir, the engine of any $3\frac{1}{2}$ h.p. on

the market will be knocked into the invalid stage in three months if forced with a double load up our mountainsides. We are not tourists; we live here, and we must have a machine for the locality. I know what it is to give l.p.a., and gasping to tail!

At last I have a beast after my own heart—a 6 h.p. Zenith and Milford radial castor sidecar. This gear ought to be seen by every motor cyclist in the North of Scotland. With Whittle belt and spark slightly retarded, and hand on gear handle, now this glorious monster roars with joy as it devours the mountainside! With J.A.P. engine this is the very lion among machines.

I do not assert that $2\frac{3}{4}$ h.p. and $3\frac{1}{2}$ h.p. are not ample for solo work even here, but for passenger work it is a monstrous farce to persuade any innocent man to buy a $3\frac{1}{2}$ h.p. and expect satisfaction. I have no interest direct or indirect in the Zenith firm, but I do wish, as an enthusiastic motor cyclist and sidecarist, to bring this glorious gear to the notice of my brother cyclists in the North. Speed to seconds is of no moment to us, but a climber we must have, not only with two gears, but with a hundred if we can get them, and we have them in the Zenith.

You will do the cause you have at heart a genuine service here in the North if with your usual courage you make known this protest from the boreal regions. Why should the truth be hidden, to the bitter disappointment of so many? *Fiat justitia, ruat cælum.* EXPERTO CREDE.

A Criticism of the Six Days' Trial Awards.

[5877.]-Your correspondent, Mr. Merrill [letter 5850], voices the opinion of many riders on the A.C.U. Trial.

I venture to say that in nearly every case the way trials are carried out and awards made is utterly useless in affording the average prospective purchaser any guide as to what machine will suit his requirements. The mere fact that riders in the A.C.U. Trial scorched along until near the controls, and then did their necessary repairs, shows the amount of confidence they had in their machines.

The ordinary rider wants a machine which will take him along at an ordinary pace, and he does not want to scorch until a breakdown takes place, even if, including repairs, his average speed approaches the limit.

Then as to tyres. Don't we often see this sort of thing: "So-and-so would have received a gold medal had it not been for tyre troubles. As it is, he gets a silver medal." Then what happens? Do the tyre makers add a bit more rubber or canvas, or improve the quality of their tyres? Not a bit of it. We see an advertisement shortly afterwards, thus: "Mr. So-and-so, using ——— tyres, secured a silver medal." Belts and tyres are in the great majority of cases utterly inefficient, in spite of occasional runs of good luck.

Let the next trials be so managed that at the end a prospective purchaser can say, "That is the machine which will do what I want, and that is the one I will have."

At present he will learn more from casual conversations on the road in a month, on the merits of various machines, than he will from the results of all the trials. H. PHILLIPS.

B. Alan Hill ($3\frac{1}{2}$ h.p. Rudge) at the foot of Newnham Hill, on the occasion of the Coventry and Warwickshire M.C. hill-climb.

American Records.

[5878.]-The writer read with great surprise your sarcastic remarks in regard to the recent ride of "Shorty" Matthews. You must certainly realise that the American public is not one which can be fooled very easily, especially those interested in motor cycling. The time of 4m. 11½s. for five miles was made from a standing start, and so you can see that at times he must have made 75 m.p.h., or better, as his average was 71 m.p.h. We are not easily "buncoed," but like to give credit where credit is due.

ARTHUR J. ROCHONE.

[Our quotation was from a Chicago daily newspaper and the speed attained was said to be 80 m.p.h. If our correspondent would mention the c.c. of the engine used it would be of interest.—Ed.]

Road Hogging.

[5879.]-I have had a similar experience to that of Mr. C. H. Cook, described in your issue of September 7th. Returning from Coventry to Birmingham on a recent Saturday afternoon I was driven off the road by a reckless car driver overtaking another without the least consideration for on-coming traffic. Fortunately, I saw what was coming in time to escape a serious smash, but was too much concerned with getting out of the road to attempt to notice the number of the offending car. Could I have read this I should have reported it to you and the A.A., of which I am a member. Criminal recklessness ought to be suppressed.

The other evening I had a very novel experience in the shape of overtaking a youth on a bicycle that was showing a white light astern. Is not this asking for trouble? I mention it merely to show that it does not do to assume anything on the road especially at night. AB 668.

Rational Riding v. Scorching.

[5880.]-May I, as an old and enthusiastic motor cyclist, thoroughly endorse the remarks in last week's paper by B. H. Davies on "Scorching." I am no "wheel novice," having owned and ridden seventeen machines from the old bone-shaker and high bicycles to the modern rear-driven safeties, and on all of them have done my share of "scorching." Eleven years ago I took up motor cycling. I have had six (motor tricycles and bicycles), and although nearer fifty than forty-five years of age, I now enjoy a "blind" at the right time and in the right place, and therein lies the whole trouble. End-to-end record breakers must go "all out" to save possibly a few minutes and secure the road. It is the people who "blind" through villages, cut-outs, hooters going, and dust raising that get the general body of motorists the bad name they have, and much as I love the sport, I am bound to own, rightly so. EFF DEE.

[5881.]-An article entitled "Scorching" by B. H. Davies appeared in your last issue. This article comments unfavourably on the road conduct of the End-to-end record holders.

I was associated with Mr. Hart-Davies as a helper on his two successful rides, and I should like to tell your readers that his riding through towns and villages was of a character that, I think, most motor cyclists, even for the dullest touring, would consider almost unnecessarily quiet and considerate. This will perhaps be as great a surprise to others as I confess it was to myself; until one reflects that records are not held by "excited and emotional" people—at least, not records in sport. RUPERT MAY.

L.C.C. v. Humber, Ltd.

[5882.]-In this case, Messrs. Humber were summoned at the Guildhall for keeping "a carriage, to wit, a motor cycle," without a licence. It was agreed that the cycle had been in use the previous year (1910), and it was discussed whether "keeping" meant "using," for the purpose of the Act. It was submitted that it must mean keeping for the present actual use, and not merely having possession of a motor cycle. The representative of the London County Council agreed that he would have to prove user of the cycle. Under the circumstances, a member of the staff went into the box, and proved that the cycle had not been used during the three months since the old licence had expired and a new one taken out, and the case was accordingly dismissed. E. AND J. MOTE.

Triple Bowden Control.

[5883.]-I recently had the pleasure of inspecting the Crescent runabout, described in *The Motor Cycle* in March last. There is a device on this car which I think could be easily adapted for motor cycles, and this is—triple Bowden control of air, throttle, and ignition. If motor cyclists would fit Bowden triple control on the handle-bars of their machines I am sure that the control would soon become popular.

Most motor cyclists are not aware of the fact that the Bowden Co. supply a triple control. I do not know the price, but it is reasonable, and within nearly every motorist's means, I am given to understand.

Wishing your paper, from which I have gained a great deal of valuable knowledge, every success,

JOHN N. RILEY.

Why Not a Vapour-driven Machine?

[5884.]-Would the writer of the article on a vapour-driven machine inform us what advantage is gained by the use of petrol instead of water in a boiler and engine? Certainly petrol has the lower boiling point, so that a lower furnace temperature would be necessary. But a lower condenser temperature will also be needed, which will not be as easy to obtain on the road as in a boat, where a water-cooled condenser is used. On the other hand, apart from its combustible nature and greater cost of making up leakages, petrol has a specific heat about half that of water, and this, together with its lighter gravity, would necessitate the use of two and a half times the bulk of fluid in the boiler that would be required if water were used.

He mentions a "drum pump" to feed the boiler. Is this some form of rotary pump? If so, has he ever used such a pump against a pressure of 200 lbs. per square inch?

J. C. BENNETT MITCHELL.

The Quality of Modern Tyres.

[5885.]-Your correspondent, "Clarendon," in a recent issue of your paper, hits the nail on the head when he complains of the present poor quality of tyres, and his suggestion that riders should give their experiences publicly is, to my mind, an excellent idea, particularly the users of sidecars.

I personally use a 3½ h.p. Rudge and sidecar, and I find, no matter how carefully I drive, I cannot get more than 800 miles out of a cover, though I have used practically every type of tyre. I have had my wheels tested from time to time for alignment, but they have always been found perfectly correct.

If manufacturers would turn their attention to making a more perfect tyre that would stand up to its work, there would be far more sidecars on the road. As it is, using a sidecar brings the running costs very nearly on a level of those of a small car, therefore, if riders could communicate their experiences through the medium of your paper, much valuable information might be gained both by the manufacturers themselves and the users.

G. C. POHLMANN

[A standard pattern motor cycle is intended primarily for solo use; if used to haul a sidecar an extra strong cover should be specified for the rear wheel.—Ed.]

SUMMARY OF CORRESPONDENCE.

A rider of a Bradbury and sidecar wishes to apologise for not stopping to help another rider at Runnymede on the 29th ult., at 7.15 p.m. The reason he could not stop was due to a most important engagement.

"Constant Reader," Ripon Yorks., "W.J.C." London-derry, and others are referred to the introduction to "Questions and Replies" each week. On receipt of *stamped addressed envelopes*, not postcards, the information they ask for will be willingly forwarded.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

WILL HILL-CLIMBS SURVIVE?
VARIABLE GEARS AND MOTOR CYCLES.
FORMULÆ FOR HILL-CLIMBS.
THE TRADE AND THE TRIALS.
500 MILES ON A SIX-SPEED.

American Records.

Some wonderful times are credited to J. Walters, who riding an Excelsior (America) lowered the times held by de Rosier for three and five miles. *Motor Cycle Illustrated* says the times are not recorded officially, and are 2m. 23s. for three miles and 3m. 28s. for five miles. It is expected that Walters and De Rosier will meet for the championship in the near future.

Naval Officers' Hill-climb.

The officers of the First Destroyer Flotilla held a most successful hill-climb at Avoch, near Inverness, on the 2nd inst. Several officers from the battle-ships at Cromarty also competed, the following makes of motor cycles being represented: Triumph, Bradbury, Scott, Premier, Douglas, and Enfield, about a dozen all told. The principal event was won by Commodore Sir R. K. Arbuthnot, Bart., R.N., on his 3½ h.p. Triumph.

Warwickshire Road Surfaces.

We do not think we ever remember the Warwickshire roads worse than they are just now. Why do not the Warwickshire road authorities adopt the tar and stone filling method for pot-holes more fully? They have apparently experimented with it in one or two places, but it is not at all general. A ride in the dark from, say, Stratford-on-Avon to Warwick, cannot be recommended just now, unless the vehicle used is a road roller. Watling Street too is a pebbly beach in many places.

Stolen Machines.

A Premier motor cycle was stolen from a lock-up shop in Leamington Spa between 10 p.m. on the 4th and 8 a.m. on the 5th, entrance being effected by means of a duplicate key. The following is the description of the machine: A new Premier, 3½ h.p., free-engine, No. of engine 5573, No. on machine 5906, Dunlop tyres, stand and carrier at rear, tool-bags each side of carrier, new Lucas lamp, old generator, identification No. A C-D 4, red ground with white letters. The number has probably been altered as paint, enamel, and brushes which had recently been used were left behind. A number of other articles were also taken away at the same time.

During the night of August 17th a new Premier was stolen by exactly similar means from a lock-up garage. Information respecting the machines should be sent to the Chief Constable, Mr. T. T. Farnshaw, Leamington.

Racing at Redcar.

Two interesting motor cycle races were held at a Unionist demonstration on Redcar Racecourse on the 2nd inst. with the following results:

One mile handicap for engines under 500 c.c.—1, C. Bone, Darlington (3½ h.p. Zenith Gradua); 2, J. R. Sorrell, Middlesbrough (3½ h.p. Triumph).

One mile handicap for engines over 500 c.c.—1, W. Danby, Middlesbrough (7 h.p. Indian); 2, C. Bone, Darlington (3½ h.p. Zenith Gradua).

The finest race of the day was witnessed between C. Bone and S. Gjertsen, of Middlesbrough, riding a 5-6 h.p. Indian in the first heat, when Bone, who was receiving start, won by a bare foot. Gjertsen gaining on him as he passed the post.

FUTURE EVENTS

Sept. 16.—Auto Cycle Union Inter-club Championship in the Midlands.

" 18.—Edinburgh and District M.C. Open Hill-climb at Amulree

" 23.—B.M.C.R.C. Race Meeting at Brooklands.

" 30.—Streatham and District M.C.C. Open Hill Climb.

Oct. 14.—A.C.U. Quarterly Trial (Midland Centre) fourth and last of 1911 series.

Advertisements of Future Club Events appear under a special heading in the Miscellaneous Advertisements columns.

A New Three-speed Gear.

For some months past we have known that the makers of the Sturmev-Archer three-speed gear for pedal bicycles have been experimenting with a three-speed hub and free engine for motor cycles. In conversation with the makers one day last week we were informed that the gear had been tested on several severe hills in Yorkshire and Derbyshire, and among other performances a 2 h.p. lightweight Humber had been driven up the cable tram route at Matlock Bath. Readers who know this hill will appreciate the excellence of the performance. It would be an extremely bad hill to climb with a 3½ h.p. engine, but with the aid of the Sturmev-Archer three-speed gear it is possible to do it with a 2 h.p. lightweight Humber. In addition to the testing this hub gear has secured, it has also been tried with a 3½ h.p. standard touring engine which gives off nearly 5 h.p.

Sidecar Axles.

Recent record rides have proved that sidecar axles and spring forks are not quite strong enough for high speed and rough roads, and before 1912 we shall probably see a good deal of alteration made in connection with the frames, forks, and axles of sidecar combinations. Of course, there is nothing like a record ride to find out weak points, weaknesses which the average tourist never discovers.

Our Legal Columns.

Mr. H. L. Buxton, a motor cyclist of Southminster, has just secured a verdict in an accident case which occurred as far back as February 22nd. In a letter to *The Motor Cycle* he says, "I believe I wrote you earlier in the year as to advice concerning this case of mine in your legal column. I may say I am very glad to have won the case both for your sake and the cause of motoring generally. That is one of the reasons why I fought."

Dealers and the Licensing Laws.

At the Greenwich Police Court last week, Charles Lurie, Blackheath Road, Greenwich, was summoned for keeping a motor cycle without a licence.

Mr. Kemp appeared for the London County Council, and Mr. Scard defended. Mr. Kemp said the cycle, with a sidecar, was used by the defendant on February 26th, he having no licence for this motor cycle. The defendant, who was a dealer in motor cycles, had a general identification mark, but that did not absolve him from the necessity for a licence for any machine he used. In reply to the magistrate, a London County Council inspector said that, according to strict law, the defendant should have a licence for each machine which he took out of his shop and used for the purpose of showing it to a customer, but he (witness) would only ask him to take one licence. Mr. Scard's defence was (1) that the defendant was never out on the machine on the day named, and (2) that if he were he used it only for testing purposes. Mr. Hutton, the magistrate, said that he must decide on the point of law that if a dealer used a machine merely for the purpose of testing it or showing it, a licence would not be required, but if he used three or four for his own use it would be necessary to have a licence. He would be pleased to state a case and have the point decided, because he did not think it had ever arisen. The summons would be dismissed.

Another Three-speed Hub Gear.

The B.S.A. Co., Birmingham, are experimenting with a three-speed hub gear of the company's own design for 1912.

3,000 Miles without an Adjustment.

D. R. O'Donovan, of White Lodge, Thornton Street, Kempston, Beds, a rider who makes long business journeys on a 3½ h.p. Singer, intends to attempt 3,000 miles during the next week or two without adjusting engine or using any tool on the engine. The clutch, wheels, and engine will be sealed.

Irish End-to-end Record.

A telegram announces that P. Stewart, of Belfast, at the end of last week covered the Irish End-to-End course in 12h. 8m., riding a 2½ h.p. Douglas. This beats C. E. Murphy's time of 13h. 6m., accomplished on a 3½ h.p. Triumph. As a comparison with the above times, Hugh Gibson's recent record ride on a 3½ h.p. Bradbury and sidecar was completed in 14h. 4m.

Motor Cycle Racing at Toronto.

The Canadian motor cycle championships for 1911 will be held at Toronto on the Exhibition two-lap track on Saturday, September 16th, under the auspices of the Toronto M.C. The races will be the regulation distances. It is expected that the honour of Old England will be upheld by Bain (Rudge-Whitworth), Orr (Bradbury), and Percy Barnes (Triumph).

The Strength of Sidecar Axles.

In view of the fatal accident, in which Mr. Joseph Polten was unfortunately killed between Mansfield and Sutton-in-Ashfield, on Wednesday, the 6th inst., readers are specially cautioned against the use of inferior sidecars, and are strongly advised to make sure of the strength of the axles. Mr. Hugh Gibson says that sidecar axles are not strong enough, and if anyone is an authority on the subject he is. Special attention is called to this and other matters on page 952. It may be recalled that this is the third serious accident in less than a month due to the breakage of sidecar axles. The cases cited should act as a warning to those who are in the habit of carrying two passengers, and thus imposing strains on the sidecar attachments which they were not designed to withstand.

Accident at New Brighton.

In the first heat of a match between some Birmingham riders and members of the Mersey M.C. last Saturday, a serious accident took place, T. Henshaw losing control of his machine when travelling at 45 m.p.h. It is reported that Henshaw looked round and that his saddle slipped. He sustained a compound fracture of the leg. Several of the spectators were severely hurt. Miss E. Tennant was taken to the hospital suffering from concussion of the brain, and Mr. E. S. Dudley with broken ribs. Mr. Peter Brown had his leg broken, and several others were hurt. The remaining motor cycling events were abandoned. This case certainly points to the desirability of restricting the size of engines used on any but properly banked tracks, not only in the interest of the riders themselves, but of the lookers-on.

Turner's Hill Climbed on a Lightweight.

H. V. Swift, of lightweight fame, on his 2½ h.p. Douglas, made the ascent of Turner's Hill, Sheffield—the roughest 1 in 3 hill in the country—six times out of six tries, the performances being watched by many sceptical riders, who had tried to mount the same hill on their 3½ h.p. machines. In fact, the number who have done so could be counted on the hands, and the failures by a note book. Mr. Dover's ascent referred to in these columns a month ago has started quite a large family of triers.

B.M.C.R.C. Seventh Members' Meeting.

Only members are eligible to compete at the B.M.C.R.C. meeting at Brooklands on the 23rd inst. The events are:

1.30 p.m.: The Junior Hour Race, for motor cycles of Classes A and B. Gold, silver, and bronze medals in each class. silver cup if record is broken. Entry fee, 5s.

3.0 p.m.: The 100 Miles Record Race, for motor cycles of Classes C, D, and E. Gold, silver, and bronze medals in each class; silver cup if record is broken. Entry fee, 5s.

Entries close on Saturday next.

First Aid by A.A. Patrols.

The A.A. patrols are doing good work in other spheres besides that of motoring. First-aid outfits were issued to the patrols of the A.A. and M.U. some time ago, and now nearly 100 cases have been reported of service rendered to all classes of road users.

Push Cycle v. Motor Cycle.

After the Sheffield Club's competition at Owlbar last Saturday, a very amusing race took place down the hill leading to the city. A rider of a Royal Enfield

push cycle challenged some of the riders of 3½ h.p. machines to race back into the city, and with the intention no doubt of giving him a lesson in manners, several accepted the challenge, and it will surprise riders of motor cycles to know the push bicycle won by about 100 yards. In fact, he gained half a mile on the motors in the first two miles covered, greatly to the amusement of the spectators.

1912 Models.

A call on Hobart Bird and Co., Ltd., last week elicited the information that they are discarding the inclined engine on the single-cylinder model, and replacing it with a 2½ h.p. vertical engine and three-speed hub gear. The inclined engine will, however, be retained for the ladies' machine, which pattern lends itself more to a dropped frame. A V-type 4 h.p. twin with three-speed gear will also be made, but Mr. Bird has not yet decided whether chain or belt transmission will be finally adopted.

Exhibition of Patents.

London is to have a permanent exhibition of patents which it is anticipated by the promoters will fulfil a long-felt want. The exhibition will be situated in a central position and will be open to the public all the year round. There will be no charge for admission. The object of the exhibition is to establish a centre where inventors may display their patents for the purpose of attracting the attention of possible purchasers, not only in the British Isles, but abroad. Visitors will be received at the exhibition from all parts of the world, and conducted through the various sections by expert demonstrators.

M.C.C. HILL-CLIMB AT SUNDON.

General view at the starting point of the M.C.C. hill-climb at Sundon last Saturday.

ON Saturday last, in ideal weather for the purpose, the Motor Cycling Club members' hill-climb was held at Sundon Hill, near Harlington, in Bedfordshire. Sundon Hill is a narrow acclivity that rises out of the valley up to the Chilterns, not far from its more famous sister Sharpenhoe. As a gradient, it is not particularly difficult, although certainly rather steeper than Sharpenhoe; its worst characteristics being a narrow twistiness, an abominably loose surface in the worst part, and a sharp turn about two-thirds of the way up.

The entry list was divided into five classes, the prizes being gold, silver, and bronze medals for first, second, and third respectively in each, whilst Commodore Sir R. K. Arbuthnot's prize was awarded for the best performance in Class II. for standard single-cylinder motor cycles exceeding 500 c.c. The last class in the programme was for any motor cycles, the fastest being the winner, whilst in the other classes the result was decided on the formula:

Weight of machine and rider

Time x cubic capacity

the highest figure of merit so found being the winner.

There was a strong wind behind the competitors which enabled some very fast times to be made, but in a great many cases, the corner already referred to was treated with more respect than it deserved.

Only three entrants participated in Class I., for light-weights not exceeding 300 c.c. for singles and 340 c.c. for twins, viz., Roy Walker (23 h.p. New Hudson), F. W. Barnes (23 h.p. Zenith), and B. Mariani (2½ h.p. P. and M.). The last went up slowly but surely, whilst Barnes and Walker were very fast indeed, though Walker's engine seemed to be considerably over oiled. The speed of these two machines was almost identical. Later in the afternoon, R. Mundy made an ascent in this class on a single-cylinder Alcyon, and did a very creditable ascent indeed. The results on formula were:

- 1, F. W. Barnes (23 Zenith).
- 2, R. W. Walker (23 New Hudson).
- 3, R. G. Mundy (2 Alcyon).

Class II, for standard touring motor cycles with single-cylinder engines exceeding 500 c.c., attracted a good many entries, including four Rudge representatives. W. F. Guiver (3½ Kerry-Abingdon), J. Slaughter (3½ L.M.C.), C. S.

Burney (3½ Rudge), and G. Griffith (3½ Zenith) made very fast ascents, although Slaughter swung all over the road in the loose part in quite an alarming manner. Griffith showed himself very nearly if not quite as expert with the Zenith gear lever as Barnes, and the way these two men nonchalantly changed gear and steered their bounding machines over the villainous surface with one hand was a very edifying sight. E. B. Ware (3½ Rudge) did a good deal of wobbling, whilst A. L. Ommanney (3½ Rudge) experienced a good deal of misfiring. W. A. Jacobs (3½ Rex) and F. White (3½ Rudge) were both suffering from too high a gear. L. A. Baddeley (3 Brown) was rather slow. Most of the machines were "cut out" at the corner, and some of them even on the twisty part of the hill. Result on formula:

- 1, J. Slaughter (3½ L.M.C.).
- 2, C. S. Burney (3½ Rudge).
- 3, G. Griffith (3½ Zenith).

J. H. Slaughter (3½ h.p. L.M.C.) on the starting line. He proved the winner of Commodore Sir R. K. Arbuthnot's cup.

M.C.C. Hill-climb at Surdon.—

F. W. Barnes (Twin Zenith), who this time had to be contented with second place, S. T. Tessier (Bat) proving victor.

The Speedy Twins.

There was even more "cutting out" in the next class, which was for standard touring motor cycles with twin-cylinder engines exceeding 340 c.c. The three ascents in this class were certainly thrilling. Barnes came up at a high speed and with a pretty bad "wobble," though this did not prevent him changing gear in the approved Barnes manner. S. T. Tessier (4 Bat) was very nearly as fast, although the engine was being "cut out" continually, even on the open part of the hill. Miss Muriel Hind (7 Rex) came up at a fast speed as far as the worst part of the hill, when her machine developed an alarming "wobble," swept from side to side of the road, and finally crashed over. The plucky Miss Hind was fortunately thrown clear of the machine, and beyond some nasty bruises on her left shoulder and right elbow, was, we

are glad to say, not much damaged. The machine also came off lightly, only suffering from a broken tyre inflator and bent footrests. Had Miss Hind been possessed of less pluck, she might easily have escaped altogether, for instead of slackening speed when she began to "wobble" on the rough part, she held on "all out," hoping to regain her balance on the smoother surface of the hill higher up. Results on formula :

1. S. T. Tessier (4 Bat-Jap).
2. F. W. Barnes (6 Zenith).

There were only three starters in the passenger machine class, viz., E. B. Ware (8 Chater-Lea), F. W. Barnes (6 Zenith), and H. E. Hull (7 Indian). The last named appeared to be the fastest of the trio, whilst Ware was rather slow. The formula, however, favoured the weight of the Chater-Lea combination and the smaller engine of the Zenith, and the result was :

1. F. W. Barnes.
2. E. B. Ware.
3. H. E. Hill.

The All Comers' Class.

Class V., open to any motor cycle, produced only one machine that had not competed in a previous class, viz., Arthur Moorhouse's 7 h.p. Indian. Of the Ridges, Ommaney made the fastest time, and had succeeded in curing his misfiring. Tessier, on his 4 h.p. Bat, did a really splendid performance in spite of a slight "wobble" over the rough, and came near to making the quickest ascent, but Moorhouse put in the fastest time in the typical Moorhouse manner. Compared to the other competitors he was at a slight disadvantage, for all the others had gone up the hill at least once in former classes. As a result he took the corner at the top a bit too fast, and got a skid, which slowed the machine considerably. The fastest performances in Class V. were as follows :

- A. J. Moorhouse (7 Indian), 47s.
- S. T. Tessier (4 Bat-Jap), 48s.
- F. W. Barnes (6 Zenith), 48½s.
- A. L. Ommaney (3½ Rudge), 49½s.
- C. S. Burney (3½ Rudge), 49½s.
- J. Slaughter (3½ L.M.C.), 49½s.
- E. B. Ware (3½ Rudge), 52s.

Following the climb, tea was taken at the George Hotel, Luton, Sharpenhoe being climbed on the way back.

AUGUST IMPORTS AND EXPORTS.

Imports of motor cycles for the month ended 31st August equalled a value of £7,472, compared with £10,411 during the corresponding month of 1910.

British exports in August increased from £16,083 in 1910 to £25,487 this year.

the turning point.
(See page 959.)

TWENTY-FOUR HOURS' RIDE.

SNARESBROOK TO YORK AND BACK.

THIS run of 403 miles, organised by the Essex Motor Club, started from the Eagle Hotel, Snarebrook. The competition was for the Triumph Cycle Co.'s silver challenge cup, which was awarded to the competitor who adhered closest to schedule times. Gold and silver medals, besides other special prizes, were offered to survivors. The competitors for the generous prize list were: A. T. Stanton (3½ h.p. Bradbury and sidecar, N.S.U. gear), B. Alan Hill (3½ h.p. Rudge and sidecar, N.S.U. gear), E. T. Gray (3½ h.p. Rudge), F. W. Applebee (3½ h.p. N.S.U., N.S.U. gear), C. Byatt (6 h.p. Salway and sidecar, Millennium gear), A. V. Deacock (4 h.p. N.L.G.), W. Cooper (3½ b.p. Bradbury, N.S.U. gear), J. L. Love (3½ h.p. Triumph), C. E. Lovett (3½ h.p. Bat-Jap), H. Evans (3½ h.p. Rudge), J. A. Campbell (3½ b.p. Rudge), H. Beal (3 h.p. N.S.U. twin, N.S.U. gear), W. C. Hemy (3 h.p. Wanderer). — Kapadia (8 h.p. Minerva and sidecar), F. J. Sowter (3½ h.p. 2 sp. Humber and sidecar), N. C. Dear (2½ h.p. Douglas), S. B. White (3½ h.p. Service-Jap), and G. L. Fletcher (2½ h.p. Douglas).

Starting at seven o'clock on Friday evening, competitors were sent off at two minute intervals, and nearly all lit their lamps before starting. Cooper was forced to retire at Epping by lamp troubles. Near Pampisford, Kapadia suffered a puncture in the back tyre, and through making too hurried a repair the tube leaked continuously until he replaced it with a new tube at Doncaster.

An Exciting Incident.

Byatt also got a puncture, and in making up time got his carburettor on fire. Things were quite exciting for a few minutes, but he managed to put it out at the cost of a badly burned coat. We then had a quiet time until we reached Cambridge, where a compulsory stop of fifteen minutes at the George was arranged. On again along the Via Devina to Fenstanton and Huntingdon, where the check was in charge of Dr. Moss-Blundell, of Leicester. Near Stilton we passed Hemy in trouble with his generator. At the latter place we came to the first of the four secret checks. These checks are arranged to take place in a section of from twenty to thirty miles indicated on the route cards. Near Colsterworth Hemy again had bad luck and a whole series of troubles, among them being a broken petrol pipe, inlet dome plunger lost, and collision with a sheep. At Grantham there was a check and compulsory stop of one hour at the George Hotel, where supper was obtainable for those who required it. Just as we were leaving Hemy came in. However, after looking over things a bit he decided to have a try to complete the course. We found the Trials hon. sec., Mr. Siffken, in charge of the second secret check, with Mr. A. G. Reynolds (timekeeper) in the official car. Sowter was nearly twenty minutes behind time, as he found he could not average 20 m.p.h. Dear, White, and Kapadia did not check at this point, as they lost their way and struck the North Road again above Retford. We then encountered some drizzle, and the tag end of a terrific thunderstorm,

which had passed over earlier in the night, and with welcome down near Bawtry we arrived at Doncaster.

Another Retirement.

The check was arranged at the racecourse garage and hot coffee was enjoyed at the hotel next door. Here Sowter decided to retire, as he was still further behind time, with no prospect of making it up. The machine ran perfectly, but there was a lack of speed which made it impossible to keep to the schedule. Byatt had trouble with inlet valves and dome, and had lost his way, but was still cheery. In the next thirty-five miles to York he made up about half an hour, so the pace must have been rather exciting. Just outside York, Hill replaced a faulty inner tube, and found he had lost a silver watch and chain, a P and H. lamp, and his M.C.C. Winter Ride gold medal. The check was at the Windmill Hotel, with a compulsory stop of one hour to allow for breakfast. Fletcher had started from Epping over half an hour late, so did not arrive until we were thinking of getting off to London again. We learned that Campbell was nearly knocked off his machine by a policeman near Grantham, and that F. W. Applebee lost his pump about the same time. We noticed two rather interesting devices. Hill had rigged up a novel steering arrangement with a canvas belt and string from the handle-bars. By leaning back into it he could steer without holding the handles. Gray had a foot-operated throttle on the principle of the accelerator pedal.

All went merrily now with daylight and a following wind, and the temper of some of the competitors was considerably improved. A few miles out of Grantham we stopped to see some of the competitor go by and early realised that the twenty miles per hour schedule had been forgotten. Beal broke his exhaust lifter while restarting but got it repaired in Grantham. Proceeding, we soon came up with Hemy, who had spent the night on the roadside in consequence of his Wanderer giving up work altogether. Evans and Campbell took him in tow to Grantham where he left his machine, to return to London on the carrier of White's Service-Jap. From Grantham to Cambridge, where a stop of fifteen minutes was allowed for, there was no incident excepting that we passed Sowter, with his passenger driving. As they were doing a good thirty miles per hour it was evident the trouble had been overcome, and we learned that the lack of speed previously was due to too high a gear. The last man in trouble was Lovett, who punctured near Hockerill. All the starters finished inside time to qualify for an award, with the exception of Cooper, Hemy, and Sowter, whose retirements are already recorded. Everything worked smoothly throughout the run, with the exception that the feeding arrangements might have been better at Grantham and York. A noticeable feature is that half of the machines were fitted with a change-speed gear. As the course has no hill in it worthy of the name, it shows these gears are used for general convenience in starting and traffic riding. Thanks are due to Mr. S. G. Cummings for the loan of the official car.

SNARESBROOK—YORK—SNARESBROOK 24 HOURS' RIDE.

Members of the Essex Motor Club outside the Windmill Hotel, York, the turning point of this annual competition, which took place last week-end.

TWO NEW MODEL ENFIELDS.

A new model open frame single-cylinder Enfield with two-speed gear and chain transmission. The engine is a 2½ h.p.

ALWAYS to the fore where improvement is concerned, the Enfield Cycle Co., Ltd., of Redditch, has introduced two new models for 1912, one of which we are enabled to illustrate. The completed new pattern is an open frame single-cylinder, which is intended for the use of both men and women.

This model follows the lines of the well-known chain-driven 2½ h.p. Enfield which has made a name for itself during 1911, the two-speed gear having proved itself both reliable and easy to handle. The 2½ h.p. "drop frame," as the new design is to be termed, has an engine 64 mm. bore by 75 mm. stroke, and is fitted in a slightly inclined position in the frame; the gear-driven magneto—a Bosch—is behind the engine, and is controlled from the handle-bar by Bowden wire; the carburettor control levers are as usually fitted to the Amac. In all dropped frame machines there is a difficulty in arranging an adequately sized tank, but the Enfield has a double tank fitted as shown in the illustrations, a bolt passing through both tanks and drawing them together, thus firmly supporting them. No gauge is fitted, because one tank running dry is sufficient indication that more fuel is needed, and the empty reservoir can be replenished at the next stopping place. Both should, of course, be full at the start. The oil compartment is in one of the petrol tanks, and holds a quart of lubricant, the petrol capacity being ten pints. In addition to the usual oil pump an Enots drip-feed lubricator is fitted. Owing to its position this enables the drips to be seen quite well, and it has a very neat method of controlling the needle valve.

The Gear Changing Mechanism.

The gear control is by means of two pedals carried side by side on the left footboard; depressing one pedal raises the other, so that no mistake is possible when changing speed. The same footboards will, of course, be supplied on the standard diamond pattern 2½ h.p. machine. A refinement consisting of a metal extension of the tanks is bolted in position over the engine and magneto, and enables the magneto to be readily got at for adjustment. The sparking plug is also easily accessible. The brakes are a Bowden Enfield front rim and the usual pedal-applied rear brake with shoe working on a special brake rim. The shoe has been lengthened and improved, thereby making the brake more effective.

This model will not only appeal to ladies who require a light, easily controllable machine, but will also attract an army of elderly men riders who want a machine that can be readily mounted without the necessity for lifting the leg over the carrier of a diamond frame, which is sometimes rather awkward when luggage is carried. It will also most certainly appeal to very short riders who find the usual pattern, low as it is, difficult to start by means of the clutch.

A New Bicycle for Sidecar Work.

The other new pattern is the Royal Enfield sidecar machine which is now under construction, and although not sufficiently complete for an illustration to be published to-day, is in an advanced state, and will be on the road shortly. The firm has decided to fit a 6 h.p. J.A.P. twin engine to this model, and it has been specially designed throughout for sidecar work; in fact, it will not be sold without the firm's own make sidecar attachment, which will be specially fitted with lugs to register with attachments on the frame, so that there can never be any doubt as to the proper alignment of the bicycle and sidecar. The Royal Enfield chain drive two-speed gear will be fitted, but of stronger construction. With footboards and a neatly designed coach-built body, we are looking forward to a trial of one of these interesting passenger combinations, which, with the Enfield name behind it, cannot fail to appeal to the rapidly growing army of passenger motor cycle enthusiasts.

M.C.C. HILL-CLIMB AT SUNDON.

S. T. Tessier (Bat-Jap) approaching the top bend of the hill. (See pages 957-8.)

GYMKHANA AT THE STADIUM.

THE North-west London M.C.C. held a very successful gymkhana at the Stadium last Saturday. There were sixteen events on the programme, but two had to be abandoned owing to lack of time. The arrangements were well carried out by Mr. H. J. Pooley, who, in addition to his ordinary duties, sat up nearly the whole of Friday night getting out an emergency programme; the printer having failed to get the official programme ready in

Alan E. Woodman, the New Zealander, who lost his right leg whilst practising for the T.T. Race of 1910. He was admittedly the most skilful competitor in the N.W. London M.C.C. gymkhana, winning several events.

time. The weather was dull, but pleasantly cool. There was some very interesting racing. A. E. Woodman rode very well, and got a great speed out of his little Humber. F. A. Rose (the hero of the race in France) also did well. The riders had to lean over very much on the banking, but the meeting was marred by no accident, though H. J. Pooley had rather a narrow escape his pedal scraping the barrier for a considerable distance at the top of the banking.

North-west London M.C.C. gymkhana at the Stadium. The start for the final of the lightweight race, which was won by A. E. Woodman on his three-speed twin Humber.

EVENT No 1.—THREE LAP HANDICAP (PASSENGER MACHINE).

Heat 1: 1, C. Williams (8 Chater Lea), 13s.; 2, W. O. Oldman (8 Bat), scr.

Heat 2: 1, O. Hill (8 Bat), 4s.; 2, F. Thomas (7 G.O.K.), 14s.

Final: 1, C. Williams; 2, W. O. Oldman; 3, O. Hill. Time 1m. 56½s.

EVENT No. 2.—TWO LAP SCRATCH RACE (LIGHTWEIGHTS).

Heat 1: 1, A. E. Woodman (2½ T.T. Humber); 2, F. Thomas (2½ Douglas).

Heat 2: 1, C. M. Down (2½ Enfield); 2, W. O. Oldman (2½ Douglas).

Final: 1, A. E. Woodman; 2, C. M. Down; 3, W. O. Oldman.

Time 1m. 3½s. The fastest time was made in Heat 1 by Woodman and was 1m. 2½s.

EVENT No. 3.—THREE LAPS SCRATCH RACE (SINGLE-CYLINDERS).

Heat 1: 1, F. A. Rose (3½ Triumph); 2, S. Hillhouse (3½ Triumph).

Heat 2: 1, W. O. Oldman (3½ Zenith); 2, E. E. Gwynne (3½ T.T. Triumph).

Heat 3: 1, C. B. Owen (3½ Zenith); 2, A. J. Dredel (3½ Premier).

Semi-final 1: 1, Rose; 2, Gwynne.

Semi-final 2: 1, Owen.

Final: 1, Rose; 2, Owen; 3, Gwynne.

Time 1m. 41½s.

The fastest time in this event (1m. 33½s.) was made by Oldman in Heat 2, but he started in the semi-final with his petrol tap closed, and was naturally left behind.

EVENT No. 4.—MUSICAL CHAIRS (WITH LADY PASSENGERS).

1, F. Thomas (7 G.O.K.); 2, A. S. Phillips (7 V.S.)

EVENT No. 5.—THREE LAP SCRATCH RACE (MULTI-CYLINDERS).

Heat 1: Hal Hill (5 Bat); 2, C. M. Down (5 Indian).

Heat 2: R. L. Printz (4 T.T. Bat); 2, H. C. Bean (6 Matchless).

Final: 1, Hal Hill; 2, R. L. Printz.

Time 1m. 24½s. Second man 2s. behind.

EVENT No. 6.—THREE LAP HANDICAP (LIGHTWEIGHTS).

Heat 1: A. E. Woodman (2½ T.T. Humber), scratch; 2, W. O. Oldman (2½ Douglas), 17s.

Heat 2: 1, C. M. Down (2½ Enfield), 12s.; 2, F. Thomas (2½ Douglas), 17s.

Final: 1, A. E. Woodman; 2, C. M. Down.

Time 1m. 27½s. This time beats that of the 3½ h.p.'s in Event 3.

Gymkhana at the Stadium.—

EVENT NO. 7.—AIR BALLOON COMPETITION (in which competitors had to ride over five toy balloons in a distance of 100 yards. In case of ties the fastest to win).

1, O. Hill (8 Bat and sidecar), 5; 2, A. E. Woodman (2½ T.T. Humber), 4; 3, F. Thomas (2½ Douglas), 4.

In this event a sidecar machine certainly had a great advantage.

EVENT NO. 8.—MUSICAL CHAIRS (FOR SOLO RIDERS).

1, R. G. Goslett (3½ P. and M.)

EVENT NO. 9.—FOUR LAPS HANDICAP (SINGLE-CYLINDERS).

Heat 1: 1, W. O. Oldman (3½ Zenith), scr.; 2, S. Hillhouse (3½ Triumph), 11s.

Heat 2: 1, F. A. Rose (3½ Triumph), 6s.; 2, G. B. Owen (3½ Zenith), 2s.

Heat 3: 1, E. E. Gwynne (3½ T.T. Triumph), 4s.; 2, H. Berlandina (3½ Triumph), 14s.

Final: 1, W. O. Oldman; 2, S. Hillhouse; 3, F. A. Rose. Time 1m. 56½s. This was a fine race. Oldman rode with great judgment and won by a clear length, half a length between second and third.

EVENT NO. 10.—FOUR LAPS HANDICAP (MULTI-CYLINDERS).

1, A. Brunton (5 Bat), 5s.; 2, R. L. Printz (4 T.T. Bat), 5s.; 3, Hal Hill (5 Bat), scr.

Time 1m. 48s. Fast for the track. Printz eased up when he found he could not win, and was an easy second.

EVENT NO. 11.—PUNTING RACE (FOR PASSENGER MACHINES).

1, G. Rowden; 2, J. D. Haylor.

Time 51s. Distance 100 yards.

EVENT NO. 12.—Abandoned.**EVENT NO. 13.—TURKS' HEADS (FIVE HEADS ON ALTERNATE SIDES OF THE TRACK).**

1, C. Williams (8 Chater-Lea and sidecar); 2, W. O. Oldman (2½ Douglas); 3, C. H. Hollis (2½ Douglas).

EVENT NO. 14.—FOUR LAP RELAY RACE (FOR TEAMS OF FOUR).

Heat 1: 1, Red team; 2, Blue team.

Heat 2: 1, Orange team; 2, Green team.

Final: 1, Green team—C. M. Down (2½ Enfield), S. Hillhouse (3½ Triumph), H. C. Bean (6 Matchless), F. Thomas (7 G.O.K. and sc.); 2, Orange team—A. E. Woodman (2½ T.T. Humber), E. E. Gwynne (3½ T.T. Triumph), H. Hill (5 Bat), W. O. Oldman (8 Bat and sc.)

EVENT NO. 16.—NINE LAP HANDICAP (ANY MACHINE).

Heat 1: 1, F. A. Rose (3½ Triumph), 28s.; 2, E. E. Gwynne (3½ T.T. Triumph), 22s.

Heat 2: 1, W. O. Oldman (3½ Zenith), 20s.; 2, A. Brunton (5 Bat), 12s.

Heat 3: 1, R. L. Printz (4 T.T. Bat), 12s.; 2, G. Rowden (3½ Triumph), 28s.

Heat 4: 1, S. Hillhouse (3½ Triumph), 28s.; 2, H. E. Taylor (3½ Zenith), 22s.

Final: 1, W. Oldman; 2, A. Woodman; 3, R. Printz.

Times not taken. This was a most interesting race. A. E. Woodman (2½ T.T. Humber) was allowed to compete in the final, although, owing to some mischance, he did not ride in his heat. He made a great race of it with W. O. Oldman, from whom he had a short start, and his skill on the banking served him in good stead. For several laps he was able to keep his lead, but with about half a lap to go, Oldman forged ahead and won by a few yards. R. L. Printz was a good third.

WEEK-END CLUB EVENTS.**Ilkley and District M.C.C.**

On Saturday last the above club held a series of speed trials for a trophy presented by the members of the motor trade in the district. The course chosen was on a stretch of road on Snowden Moor, situated between Otley and Blubberhouses.

Each competitor was given a certain speed, the one improving upon his speed the most to be the winner.

The length of the timed stretch was about half a mile. The competitors were somewhat handicapped by having a slight uphill gradient on which to get up speed.

The following shows the three best results:

Rider and Machine

		Speed given	Speed attained	Improvement
		m.p.h.	m.p.h.	m.p.h.
J. A. Hoffmann	(3½ T.T. Triumph)	60	62.6	+2.6
J. Norman Longfield	(3½ T.T. Triumph)	59	59.42	+ .42
C. Thackray	(3½ J.A.P.)	...	58.14	56.61 -1.53

Each competitor was allowed two attempts, the best time to count.

The awards were: Trade trophy and club gold medal, club silver medal, and club bronze medal.

Mersey M.C.

A speed-judging competition last week-end resulted in a win for F. C. Jones (Bradbury), G. Morley (Triumph) being second. There was only an error of .04 m.p.h. in the winner's speed.

HILL-CLIMBING IN PICTURES.

We have been asked to mention that the cinematograph film of the Coventry and Warwickshire M.C. hill-climb at Newnham will be exhibited at the Picturedrome, Lord Street, Southport, during the first half of next week, and for the remainder of the week at the Kensington Picturedrome, Liverpool.

TRUMP-JAPS IN 1912.

A company is being formed to manufacture and sell the well-known Trump-Jap machines, and an excellent factory has been secured in Birmingham equipped with up-to-date machinery, and under the management of a well-known cycle engineer, Mr. F. A. McNab, whose present address is 70, Lombard Street, Birmingham, will hold the position of sales manager, and will also be a director. We may perhaps remind our readers that the Trump-Jap machine holds more world's records than any single-cylinder motor cycle of the same power.

TORBAY M.C.C. OPEN HILL-CLIMB AT RAYDOWN HILL (near Ashburton).

R. Broadbear (3½ h.p. Premier) making a last ascent in the single-cylinder class, which he won.

OPEN HILL-CLIMB IN DEVON.

GLORIOUS weather and an entry of eighty-six combined to make this the first annual open climb of the nine months old Torbay and District Motor Cycle Club a great success. Raydown Hill, which is about a mile long, was the venue. It was in excellent condition, and had been swept for the climb. It is fairly steep, and a steady pull all the way up, with several corners, on which many of the machines had to cut out. Milner's

A competitor at the second bend. Note the extremely narrow road and its winding nature.

7 h.p. Indian, which ran well, was much too fast for the course, he having to cut out for many seconds on the corners. Two falls, neither serious, were the total casualties for the day. Maurice (3½ h.p. Premier) fell owing to a burst cover, but pluckily changed wheels and ran his other events off, and R. Holloway on a similar machine, in trying to negotiate the first bend without cutting out, struck the hedge with his footrest, and did a triple somersault. Though bruised and scratched he resumed later. P. Arden almost followed suit. J. Woodhouse went up at a great pace, but the last and worst bend almost proved too much for his speed. The ladies' event, for which there were two entries, attracted special notice, Miss MacPherson riding a T.T. Premier with dropped handle-bars to victory. She took the hill in splendid style, and managed the bad corner well.

Miss M. Arden, who has only been motor cycling for a week, is to be commended for her pluck; unfortunately her new 3½ h.p. Brough failed half-way up through insufficient pace at starting. The fastest time of the day was made by R. Broadbear on his 3½ h.p. Premier. Except Class 4 every event was open to any variable gear. In the passenger class, which attracted five competitors, none succeeded in getting up the hill. A. J. Luce's 8 h.p. Bat and sidecar went furthest. The principal thrill of the day was R. Broadbear's marvellous recovery from a dry skid just past the top bad corner. How the machine was kept up all through the gyrations it performed was astonishing. Time-keepers were Mr. R. Crouch and Mr. Gilley; starter, Mr. N. Cox; judges, Mr. Trinaman and Mr. Birdsall. Altogether the climb was voted a great success for a young club, which is to be congratulated on its success and the consistently good riding of its members. Devonshire is the land of hills, and the committee hope to make the next open climb a huge success. This is the largest motor cycling event that has been organised in the West, and when the large centres are sweltering under a late summer heat a change to the cool sea breezes (with your motor cycle at hand) is pleasant.

R. Broadbear's performance calls for special mention on his 3½ h.p. Tourist Premier; he annexed no less than four gold medals for best times, a field day for Premiers.

The formula results will be published next week.

CLASS 1.—Open Lightweight Event, for engines 345 c.c.

	m. s.
1. A. Powell (2½ Enfield)	1 47½
2. W. W. Douglas (2½ Douglas)	1 54½
3. E. Kickham (2½ Douglas)	1 54½

CLASS 2.—Touring 500 c.c. Single, 750 c.c. Multi.

1. R. Broadbear (3½ Premier)	1 23½
2. J. Woodhouse (3½ Comet Precision)	1 26½
3. F. T. Wilson (3½ Rudge)	1 34

CLASS 3.—Club Lightweight, 345 c.c.

1. A. Powell (2½ Enfield)	1 46½
2. H. Benny (2½ Enfield)	2 4
3. B. Edwards (2 Motusacothé)	3 22½

CLASS 4.—Touring 500 c.c. Singles, Fixed Gears.

1. R. Broadbear (3½ Premier)	1 27½
2. J. Woodhouse (3½ Comet Precision)	1 30½
3. F. T. Wilson (3½ Rudge)	1 37½
4. L. Broadbear (3½ Premier)	1 38
5. A. P. Maurice (3½ Premier)	1 43

CLASS 5.—Racing Machines up to 1,000 c.c.

1. J. Woodhouse (3½ Comet Precision)	1 30½
2. J. Milner (7 Indian)	1 31½
3. W. G. McMinnies (3½ Triumph)	1 34
4. Lister Cooper (3½ Triumph)	1 35
5. R. W. Williamson (3½ Norton)	1 40½
6. J. G. Birch (3½ Triumph)	1 42½
7. A. J. Luce (8 Bat)	1 43

CLASS 6.—Ladies' Event.

1. Miss M. MacPherson (3½ Premier)	2 23
---	------

CLASS 7.—Club, Unlimited.

1. R. Broadbear (3½ Premier)	1 30½
2. R. Holloway (3½ Premier)	1 34
3. J. Milner (7 Indian)	1 36
4. R. Williamson (3½ Norton)	1 37½
5. W. C. Hardy (3½ Norton)	1 38
6. L. Broadbear (3½ Premier)	1 40

CLASS 8.—Racing 500 c.c. Singles.

1. J. Woodhouse (3½ Comet Precision)	1 32½
2. R. Broadbear (3½ Premier)	1 32½
3. W. G. McMinnies (3½ Triumph)	1 36
4. Lister Cooper (3½ Triumph)	1 37½
5. R. Holloway (3½ Premier)	1 38
6. J. G. Birch (3½ Triumph)	1 40

The secretary of the club, A. Powell (2½ h.p. Enfield), starting in Class 3 for lightweights, which he won, in addition to Class 1.

CLUB NEWS.

Walsall M.C.

On September 17th a hill-climb will be held at Style Cop, near Stafford, consisting of the following classes: 1, single touring machines up to 500 c.c. time; 2, ditto, knock-out; 3, T.T. machines (singles) up to 500 c.c. time; 4, light-weights up to 300 c.c. time; 5, twin up to 1,000 c.c., only to be run if more than two entries, time. Meet at the Stork Hotel at 11 a.m.

Edinburgh M.C. Dobson Trophy competition. The Leven team starting.

Birmingham M.C.C.

The above club is sending a strong team to take part in the A.C.U. international club championship trials on Saturday next. The following being the team: R. W. Duke, P. J. Evans, Dr. Fawcett, H. D. Jones, S. C. Perryman, and A. J. Stevens.

Last Saturday the third annual paperchase was held. The honorary secretary, who presented the first prize, was the hare. He laid a trail through many rambling lanes in the neighbourhood of Earlswood, including two water splashes. Unfortunately, however, the "hounds," by a curious coincidence, "short circuited" about six or seven miles of the trail, including the water splashes, and thus brought the chase to an end somewhat earlier than was expected. Mr. Duke was the winner, with Mr. A. Young second.

Burnley A.C.

The above club held a race meeting on Saturday, the 9th inst., at Grane, near Haslingden. The event was run on the knock-out principle, some very fast times being done. The first prize was won by W. Simpson on his T.T. Rudge; and the second by R. Winterbottom on his Ariel.

Chesterfield and District M.C.C.

The team of riders in the inter-team club championship at Banbury, on September 16th, will all be riding $3\frac{1}{2}$ h.p. 1911 Bradbury machines, and will be chosen from the following: A. C. Seals, with sidecar, J. S. Wilcockson, A. Watson, F. Kelly, D. Ferguson, F. Simpson, J. J. Kelly, and L. Smith, captain of team.

Essex M.C.

For the benefit of new members and those members who have not been able to go before, a special standard ride to King's Lynn has been arranged for Sunday, September 17th. Full particulars and route cards from T. M. Tyson, 29, Osborne Road, Forest Gate.

Sheffield and Hallamshire M.C.C.

The weekly competition of the above club took the form of a petrol consumption trial over a circular course of six miles, which had to be covered three times. The start was Beachief to Totley, Dore, Whorlow, and down the hill again to Beachief. The results are as follows:

	Fig of merit
1. T. Durant ($3\frac{1}{2}$ Jap)	129.0
2. D. Bradbury ($3\frac{1}{2}$ Norton)	121.2
3. C. Bellamy ($3\frac{1}{2}$ Zenith)	78.9

Edinburgh and District M.C.

An open competition for Scottish motor cycle clubs for the Waverley trophy was held on Saturday last, 9th inst. This trophy is a valuable and very neat piece of workmanship, presented by Mr. J. M. Dobson, a member of the above club. The competition consisted of a fifty miles reliability trial, and two timed hill-climbs on minor hills. Two teams of three competitors each were entered by the Leven M.C.C. and three teams by the Edinburgh and District M.C.C., Ltd. After a very enjoyable afternoon's sport, the winners were found to be the Edinburgh club.

Fastest time on hill.—1, A. H. Alexander (7 h.p. twin Indian), 36 $\frac{3}{4}$ s.; 2, J. R. Alexander (7 h.p. twin Indian), 38 $\frac{1}{2}$ s.; 3, R. H. Mouat ($3\frac{1}{2}$ h.p. single Rudge), 40 $\frac{3}{4}$ s.

Walthamstow M.C.

The results of the Clacton-on-Sea to Woodford non-stop run on the 10th inst. were as follows: J. H. Kerr ($3\frac{1}{2}$ Rudge), R. J. Lisle (5 Humber tricar), H. T. Browett (8 Minerva), A. Renault (5 Rex and sidecar), A. T. Peppercorn ($3\frac{1}{2}$ Bradbury), F. W. Applebee ($3\frac{1}{2}$ N.S.U. and sidecar), C. T. Talbert (4 Indian and sidecar), G. West (5 A.C. tricar), A. Uffman ($3\frac{1}{2}$ Humber), and W. G. Laver (5 Sarolea and sidecar) made non-stops. Wilson (4 $\frac{1}{2}$ Howard Precision and sidecar) punctured sidecar wheel, Duffield ($3\frac{1}{2}$ Triumph) stopped engine accidentally, Peppercorn ($3\frac{1}{2}$ Bradbury) sooted plug, W. S. Low ($3\frac{1}{2}$ Scott) ran out of petrol, W. Applebee (2 Centaur) punctured, and D. Fairhead (4 Peugeot) sooted plug.

THE MERSEY MOTOR CLUB AND BIRMINGHAM M.C.C. TEAMS.

The teams of four in the ill-fated inter-club team race at New Brighton track last Saturday. T. Henshaw, who is marked with a X, owing, it is said, to his saddle slipping, dashed into the spectators at 45 m.p.h., injuring several as well as himself.

THE COMBINATION THAT GIVES MAXIMUM EFFICIENCY.

The combination of the New Hudson $3\frac{1}{2}$ h.p. Motor Cycle, with the Armstrong 3-speed Gear and Clutch, gives a reserve of power and flexibility of control, not obtainable with single-gear machines of any power.

The New Hudson 3-speed Motor Cycle has been consistently successful in open competition, and won the approval of impartial experts everywhere.

A GRAND HILL CLIMBER—IDEAL FOR SIDECAR USE.

See "The Motor Cycle," August 31st, on the Reliability of Variable-Gear Machines.

$3\frac{1}{2}$ h.p.
57 Gns.

$2\frac{3}{4}$ h.p.
47 Gns.

THE ARMSTRONG 3-SPEED GEAR—"THE GEAR THAT NEVER FAILS,"

is perfectly reliable and without complications, its action is instantaneous and noiseless, its operation simplicity itself, the gears are changed while travelling without risk of damage even by rough or careless treatment.

ALL IN THE HUB—NO TROUBLE.

The following letter was sent to us by a well-known City Merchant, an old rider and owner of various makes of Motor Cycles:—

"It may interest you to know that I have not had to touch the engine on my 900 mile trip. I took Sutton Bank at first shot, Lythe Bank (a very bad hill well known in Yorkshire) six times without failing, and Blue Bank three times. I have never been stopped on a single hill, and we have had some terrible ones on the Moors, most of them with hair-pin bends.

"The Armstrong gear is marvellous, and the engine is certainly beyond all praise. There is not a weak spot in the machine, and I would not exchange it for any other in existence."

"THE VARIABLY GEARED MACHINE IS THE ONLY MOUNT FOR THE RIDER WHO WANTS TO GO EVERYWHERE WITHOUT A LOT OF FIDDLING BY THE ROADSIDE."—*The Motor Cycle.*

Club News.—

North Middlesex M.C.C.

This club is holding a paperchase on the 16th inst., meeting at the Abercorn Arms, Stanmore, at 3.30 p.m. sharp. A very interesting and novel route has been selected in the surrounding country, and a good afternoon's fun is assured.

North Staffordshire M.C.C.

The third and final reliability trial took place on the 3rd inst. The course, which was from Whitmore to Market Drayton, Audlem, Nantwich, Woore, Keele, Newcastle and Whitmore, had to be covered three times, the total distance being 130 miles. There were two controls and three secret checks. T. F. Rodgers on a Rudge obtained full marks (100), not stopping and arriving at all controls on time. Result: 1, T. F. Rodgers (3½ h.p. Rudge), 100; 2, C. E. Fowke (3½ h.p. T.T. Triumph), 93; 3, W. J. Beeston (3½ h.p. Bradbury), 89; 4, H. Madeley (3½ h.p. Lincoln Elk), 88. The Ashton Cup for the best performance in aggregate of the three trials was won by H. Madeley, with a score of 233, C. E. Fowke being second with 231, while the third position was secured by T. F. Rodgers 193½. The maximum number of marks was 300.

Liverpool A.C.C.

This club is holding an open reliability trial on October 7th and 8th, over a 200 miles course in North Wales. The riders will return to Liverpool on Saturday evening, where their machines will be placed in a lock-up garage for the night. The event will be held under a special permit from the A.C.U. A fifty guinea challenge vase, presented by the Reliance Engineering Co., of Liverpool, will be competed for; in addition, a number of valuable prizes will be offered. The trial will consist of two 100 mile runs over a specially selected course. The event will take the form of a non-stop run; controls will be established for replenishments, etc.; marks will be awarded for hill-climbing, reliability, and condition of machine at finish. Entry forms will be ready shortly, and may be obtained from the hon. secretary, Mr. L. V. Barton, Shirley, Queen's Drive, Mossley Hill, Liverpool. As this is the first open event that has ever been held in this district, it is to be hoped there will be a large entry.

Norfolk M.C.C.

By kind permission of Col. the Hon. C. Harbord, a race meeting was held at Gunton Park on Saturday, the 2nd inst. The course was a mile in length, and the timing was done electrically with the apparatus designed by Mr. R. H. Williams, the late hon. secretary of the club. This apparatus has been used by the club for the past two seasons, and has been most successful. The starter was Mr. H. Master, and the timekeepers in charge of the starting and stopping switches were Messrs. A. E. Lacey and A. Wyatt.

The results of the racing were as follows:

Private Match.—Dr. Blake (2½ h.p. Anglian), receiving 15 secs., beat Dr. May (3½ h.p. Phelon and Moore).

Multi-cylinder Touring Machines (Handicap).—1, Harold Collins (8 h.p. Bat); 2, F. C. North (6 h.p. Matchless); 3, G. Boswell (6 h.p. Matchless); 4, A. Adcock (5.6 h.p. F.N.). Winner's speed, 57.58 miles per hour.

Single-cylinder Touring Machines (Handicap).—1, Dr. V. H. Blake (2½ h.p. Anglian); 2, E. M. Wood (3½ h.p. Matchless); 3, A. R. Ider (3½ h.p. Bat); 4, B. Horner (3½ h.p. Ariel); 5, G. Boswell (3½ h.p. Ariel); 6, Dr. H. R. Mayo (3½ h.p. Phelon and Moore); 7, H. F. North (2½ h.p. Hobart). Winner's speed, 38.71 miles per hour.

Lightweight Machines (Handicap).—1, Dr. V. H. Blake (2½ h.p. Douglas); 2, Dr. H. R. Mayo (2½ h.p. Enfield); 3, D. Palmer (2½ h.p. Douglas); 4, H. F. North (2½ h.p. Hobart). Winner's speed, 40.82 miles per hour.

Tourist Trophy for Stripped Machines, 1,000 c.c. and under.—1, G. Boswell (7 h.p. Matchless), time 50 secs., speed 72 m.p.h.; 2, F. C. North (3½ h.p. Ariel), time 60 secs., speed 60 m.p.h.

Any Machine (Handicap based on Trial Run).—1, Dr. V. H. Blake (2½ h.p. Anglian); 2, Harold Collins (8 h.p. Bat).

Dr. V. H. Blake wins the cup presented by A. Adcock, and G. Boswell wins the cup presented by Hugh Boswell for breaking the club record, he having reduced it from 55½s. to 50 secs. on the flying mile.

Torbay and District M.C.C.

Over eighty entries were received for the open hill-climb held at Ashburton, on September 9th. There were nine classes including ladies and passengers classes.

Streatham and District M.C.C.

The annual open hill-climbing competition will be held within half an hour's riding distance from London on the 30th inst., at 2 p.m. sharp. This is the last open hill-climb of the season, and will include classes as follows: Light-weights in touring trim not exceeding 340 c.c., single-cylinder touring machines with engines up to 500 c.c., multi-cylinder touring machines up to 1,000 c.c., variably geared touring machines, singles up to 500 c.c., and multis up to 1,000 c.c. a separate class for any machines with engines up to 500 c.c., and another class for any machines with engines up to 1,000 c.c. There will also be a class for passenger motor cycles, triars, sociables, and motor bicycles with sidecars.

The entrance fees are: Non-members, 10s. each class first event, and 7s. 6d. each subsequent; members of the Streatham and District M.C.C. 5s. each class.

Gold medals will be awarded to the winner in each class, and silver and bronze to the second and third, provided there are not less than ten entries.

The Greig challenge cup will also be competed for again in the variably geared class, the cup to be awarded to the rider making the highest figure of merit. The holder is F. W. Barnes (3½ h.p. Zenith).

The Tilley challenge cup will be awarded to the member of the club (non-trade) making the highest figure of merit of the day, but this award is not open to passenger machines.

The formula used will be $\frac{W}{C \times \sqrt{T}}$.

Entry forms and full particulars can be obtained from the hon. sec., 10, Daysbrook Road, Streatham Hill, S.W.

Daimler M.C.C.

This club will hold its annual hill-climbing contest on the 23rd, when two prizes will be awarded on formula.

H.P. will be calculated thus $\frac{D^2 \times \sqrt{S}}{18,000}$ for singles, and $\frac{D^2 \times \sqrt{S \times 8 \times N}}{18,000}$ for twins. The formula will be $\frac{H.P. \times T}{W}$

T being time in seconds, W weight in lbs., D bore in mm., stroke in mm., and N number of cylinders.

The hon sec. is Mr. G. D. Robbins, 4, Trinity Terrace, Radford Road, Coventry.

Tunbridge Wells and District M.C.C.

The recent reliability trials resulted as follows: 1, A. E. Sutton (2½ h.p. Douglas), lost 1 mark; 2, F. M. Pickett (3½ h.p. P. and M.) lost four marks; 3, R. Carey (3½ h.p. B.S.A.), lost five marks. There were fifteen competitors. The first prize was a Rom combination cover (presented by the Rom Tyre and Rubber Co.), whilst the second and third prizes were Continental butt-ended tubes.

Hull and District M.C.C. climb at Spout Hill, Brantingham (Yorks). A general view of the starting point.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Touring in the Isle of Man.

Will you please let me know if there is any tax or duty to pay for taking a motor cycle into the Isle of Man for touring purposes?—F.R.R.

No; all you have to do on arrival is to register the machine at the offices of the Highway Board. Any policeman will tell you where these are. There is no fee for a visit.

Nottingham to Yarmouth.

I intend motor cycling to Great Yarmouth shortly and would be pleased if you could give me the best route to take from Nottingham. I also desire to know the distance between each town in order to make a timetable accordingly.—A.S.B.

We have pleasure in giving you the following route: Nottingham, Grantham, 24½ miles; Donnington, 20; Long Sutton, 21½; King's Lynn, 14; Swaffham, 15½; East Dereham, 11½; Norwich, 16½; Acle, 11½; Yarmouth, 8½; total, 142½ miles.

A Silent Machine Wanted.

I wish to get a second-hand mount to serve my novice on, and should be much obliged if you will reply to the following queries. (1.) Can a sound, if somewhat obsolete mount, be obtained for about £12? (2.) Can you recommend the Service Motor Co., of High Holborn, as a straight firm, and as one likely to take the trouble to give satisfaction in a comparatively small transaction like this? (3.) I wish to make my mount as silent as possible, i.e., more so than machines which are called "silent," but which I do not consider so, even when the cut-out is closed. I thought of fitting a Clair silencer with a long extension pipe to the back axle. (4.) Does an adjustable pulley have to be specially bored out to fit the shaft of one's machine, or are the shafts of most machines fitted with a standard taper?—V. G. P.-W.

(1.) Yes, a fairly sound machine could be bought for this price, but you must not expect anything very up-to-date for this money. (2.) We can thoroughly recommend the firm mentioned here. (3.) You would find this silencer to be quite efficient, but we are afraid you could not use a long extension pipe behind. What you would have to do would be to fit a long exhaust pipe and put the silencer at the end of it. (4.) Most adjustable pulleys are made to fit different makes of machines.

Magneto Timing.

Re Occasional Comments by "Ixiom" in *The Motor Cycle*, June 15th (a magneto timing notion). He states most engines admit of three good magneto timings, each intended for a special purpose. The biggest advance is for speed work, a medium advance for ordinary touring, and a special rather late advance for sidecar work or ascending abnormally steep hills. Can you kindly let me know the following: What position must piston and magneto lever be in for timing engine for the following—1, speed work; 2, ordinary touring; and 3, sidecar work or ascending abnormally steep hills. (4.) Have all high tension magnetos the same amount of movement from retard to full advance?—S.K.

The best settings will be as follows: (1.) For speed work, lever fully re-acted, points to break on the dead centre. (2.) For ordinary touring work, lever one-third from full retard, points to break on the dead centre. (3.) For sidecar work, lever slightly farther from retard. (4.) The advance and retard range is practically the same in all magnetos.

Private Specification.

I am thinking of having a motor cycle made to order for general all-round riding, and to take a sidecar occasionally. I lean towards a single-cylinder 3½ h.p. m.o.v. engine (about 500 c.c.), but my chief anxiety lies in the transmission and gearing. Chain-drive seems to be coming more prominent. No doubt both chain and belt-drive have their own advantages one over the other, but which would you advise for all-round use and reliability? I do not know very much about the many variable gears there are, but which would you recommend? What method of lubricating would you have?—H.B.

Certainly, if you prefer it, have chain-drive. This is now quite satisfactory as carried out on up-to-date machines. It is better for wet weather, but is not quite so smooth as the belt. A good countershaft type of chain-drive and two speed gear would suit your purpose best. As regards lubrication, one of the new Best and Lloyd lubricators, described in our issue of the 10th ult., or a J.A.P. would work quite satisfactorily.

Competitors waiting their turns to ascend Newnham Hill in the Coventry and Warwickshire M.C. open hill-climb.

Deals with an Agent.

?

I am enclosing herewith particulars of my transactions with a motor cycle agent. I hope I am not troubling you too much, but I should like to have your legal adviser's opinion. The firm is agent for the Zenith-Gradua machine, and I wanted a 6-7 h.p., and they told me they could get me a 7-8 h.p. for the price of a 6-7 h.p. machine. I agreed to have it. Next morning the son comes out to see me and offers me a B.S.A. machine, and explains that it would suit my purpose all right. I expressed my doubts, as I have some of the worst hills in South Wales to traverse. I told him that I should require a low gear put on. He promised to do so. He next writes to say that he has got a sidecar and clutch put on. I wanted a sidecar. I wrote back and said that I would not under any consideration take the clutch instead of the low gear. He comes out again and takes me for a ride, and although I expressed my doubts as to the arrangement being satisfactory, he refused to write anything about the matter. He has refused to let me have the machine until I pay for it, or sign a hire form. The latter I declined to do, and promised to take the machine when I could pay for it. Since I promised to do so I have found out that the machine has been run about 1,500 miles, and the agents for the B.S.A. firm assure me that the clutch put on will cause trouble, and be of little or no use. They have taken liberty with my ignorance, and have, I should think, offered me the machine under false pretences. What I want to know now is this: Must I take the machine? I have paid no instalment nor signed any agreement—only the promise I made in my letter. I did not like to trouble you by sending you all the correspondence that has passed on the subject.—INTRICATE.

Our legal adviser writes as follows: "Without seeing the correspondence it is impossible to say definitely whether your correspondent is bound to purchase the machine, but apparently he has under-

taken in writing to take the machine when he can pay for it, and as the dealer appears to have accepted these terms by insisting on the sale of the machine, both parties will be bound. If 'Intricate' showed the correspondence to his solicitor he would be able to advise him definitely. I do not see why a charge of false pretences should be made. I presume the machine was purchased as a second-hand one, and there is nothing to show that it was represented as not having been used for 1,500 miles. Moreover, your correspondent agreed to take the motor cycle with full knowledge as to the clutch. Of course, if the machine was purchased as a new one your correspondent would not be bound."

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we have decided to keep a list of such articles, and all that are notified to us will be inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons will be put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

London to Lynmouth.

?

I ride a $3\frac{1}{2}$ h.p. Zenith-Gradua with sidecar, total 18 stones, and I purpose going to Lynton and Lynmouth. Would you mind giving particulars as to the best route, avoiding steepest hills, if possible, but would prefer shortest route?—H.W.S.

Your best route would be as follows: London, Hounslow, Staines, Bagshot, Hartley Row, Basingstoke, Whitechurch, Andover, Amesbury, Hindon, Wincanton, Sparkford, Langport, Taunton, Milverton, Bampton, South Molton, Lynton. Or

Taunton, Williton, Dunster, Porlock, Lynmouth, Lynton. There is a private road from Porlock which avoids the bad hill. Steep and long descent (Countisbury) into Lynmouth. Lynmouth, as you know, lies in a hollow, and only reached by descending a steep hill, and only left by ascending this or another equally steep. However, with the variable gear you ought to manage without difficulty. You might make enquiries at Bampton for the road which runs direct through Dulverton to Lynton. This would shorten the journey.

What to Buy.

?

I am contemplating buying a motor cycle and sidecar, and should be glad of any advice you could give me. I want one that will always bring me home and take all hills, no pedalling on my part. Reliability the most essential thing, as I have not much time to spend on engine. Should ride solo at times, but mostly with sidecar. Should like one with seat built into frame, but there seems nothing on the market to fill my wants. (1.) Would $3\frac{1}{2}$ h.p. single-cylinder be enough, or should I have to have a twin. (2.) Two or three speed gear. (3.) Size of tyres. (4.) Sidecars, rigid or castor wheel; should want it coachbuilt.—D.J.

(1 and 2.) Any of the first-class twin-cylinder machines would be most satisfactory for sidecar work round Birmingham. If it is absolutely necessary to have a single-cylinder we should advise you to fit a two or three-speed gear, as otherwise the hills in the surrounding neighbourhood would be too steep for the machine. (3.) A light car type can be recommended for rear wheel of sidecar. For front wheel and sidecar wheel $2\frac{1}{2}$ in. is sufficient. (4.) It is probable that the rigid sidecar would give you the best all round results.

EXPERIENCES WANTED.

"S.L.A." (Sheffield.) Horse-power necessary for sidecar, combined weight of passengers $25\frac{1}{2}$ stones.

"C.P. 376." N.S.U. two-speed gear and free engine clutch, with a 1909 $3\frac{1}{2}$ h.p. Tourist Rex for sidecar work.

Competitors in the Coventry and Warwickshire M.C. hill-climb, held recently at Newnham, weighing in on the village green. Note the interested knot of lady competitors and spectators.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By ROAD RIDER.

FILING OUT AIR HOLES.

373. If for any reason a rider desires to file out the top air hole of a B. and B. carburetter he will find it much better to shape the enlarged orifice like a far than like a square. He will then get the surplus air when he most wants it, i.e., when the throttle and air slides are widest open.

EXHAUST VALVES WHICH BIND.

374. When an exhaust valve is removed for grinding or other purposes, it is always worth while to make sure

that its stem does not bind anywhere. Not every firm makes all its valves exactly alike, and a valve fitted cold is sometimes rather tight in its guide when hot. Whenever the valve is out, it is well to look for polished patches on its stem, especially on the neck, and to ease them with a dead smooth file.

FLAT TYRE WILL TAKE NO AIR.

375. Sometimes when a tyre goes flat, and a sound pump is used on the valve, the tube refuses to take any air at all, and remains flat however ener-

getically the pump is employed, while no sound of the hiss of escaping air can be heard. This is a sure sign that the valve has torn out of the tube. This is not uncommon with wired-on tyres; their defect is that when the tube is deflated there is nothing to prevent the cover moving round. Consequently, whenever a wired-on tyre is felt to bump ever so little, the rider should stop the machine as promptly as possible, otherwise he is very likely to rip the valve clean out of his inner tube.

HOLDSWORTH HARDY'S AIR FILTER.

THE filtering of the air which enters a petrol engine is a subject which is of more than passing interest to motor cyclists; because their engines suffer from carbon deposit much more than water-cooled car engines. The carbon deposit is usually composed of about 60% of road

the front of the machine. It would thus draw in purer air and give a certain amount of forced induction owing to the inertia of the air along the pipe. Inside the tube B (fig. 1) is a smaller tube C made of wire gauze and covered for the greater part of its length with what may be called a stocking, by which the air is filtered before it reaches the carburetter through the openings D (main air supply) and E (extra air) and deprived of the dust which it may be carrying, and which is largely responsible for the deposit which has to be cleaned periodically from the cylinder head. Fig. 2 shows the apparatus roughly attached to a Rudge machine for trial.

Our riding experience of the device has up to the present been somewhat limited,

which is notoriously dusty when the roads are dry they will, we feel sure, appreciate the use of a practical idea such as the one invented by Mr. Hardy.

We did not take note of the petrol consumption during the trial as compared with a similar distance without it, but Mr. Hardy points out that his device is just the thing to prevent excessive consumption due to blowing back. All petrol which falls to the base of the dust trap can be caught on an absorbent pad. It will readily be seen that any amount of flooding or blowing back cannot result in loss of spirit, because if there were any leakage of this nature the petrol would be turned into vapour and drawn into the engine through the sock on the lines of a wick carburetter. In fact we should not be surprised if considerable benefit might arise from the fitting of the device due to this fact alone. We intend to keep it fitted to the machine, and will report again when we have covered a further distance with it.

A HANDY EMERGENCY LAMP.

Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W., have lately placed on the market a useful little accessory consisting of a box, the lid of which holds a mirror, four feet of tubing, and an acetylene burner. As may be

Part section of H. Hardy's air filter.

matter, that is to say, there is only roughly 40% of burnt oil. Naturally, if the 60% odd of road dust could be caught on its way through the carburetter to the cylinder, it would prevent excessive deposits adhering to the cylinder head and top of piston. To attain this end several ideas have been suggested, and a good many carburetters are provided with a gauze filter for the extra air, the main air entrance being left to look after itself. This, of course, is totally inadequate, and nothing short of a proper dust trap can possibly prevent the very small particles from entering the cylinder. It is also absolutely vital that the area of the orifice or orifices should not be reduced in any way by the intervention of fine mesh gauze.

A practical engineer, Mr. Holdsworth Hardy, of 4, Highfield Terrace, Worthinghead, Wyke, Bradford, has patented an air-filter of which he has sent us a sample which we describe and illustrate herewith.

The air enters at the tube A, which may with advantage be made much longer than that shown and carried to

The air filter temporarily attached to a Rudge.

but 300 odd miles have convinced us that a considerable amount of fine dust has been arrested by the meshes of the wool sock which fits over the gauze. We were recommended by the inventor to remove this sock if we found it interfered with the running of the engine in any way, but we certainly did not find the power or speed reduced, and have therefore left it *in situ*.

Although it is not a very difficult matter to remove the cylinder of a motor bicycle engine and scrape the piston, it is a job that a good many riders have not the time for, and if they ride in a district

Taylor's repair lamp.

gathered from the accompanying illustration, the device may be used to effect repairs by night, the lid of the box acting as an adequate reflector. When packed away, the box takes up very little room, and our readers will be interested to know that it is sold at a moderate price.

North-west London Eliminating Trials.

A VERY interesting form of competition was promoted by the N.W.L. Club on September 2nd in order to find the winner for the medal presented by the R.A.C.

A start was made from Barnet punctually at 3.15, and the twenty competitors were soon on their way *via* St. Albans, Hatfield, and Potters Bar to Northaw for the first hill-climb. The

non-stop was continued from the top of the hill. The same hill was used for the slow test using the same gears.

The total results are given below, and the comparisons are interesting. The petrol consumption figures were worked out on Mr. Brooker's formula as set out in the A.C.U. handbook. It seems to work admirably. The hill-climb was calculated on the formula suggested by

an Australian correspondent in these pages

CT²

Cherry (Rudge) rode the 56 miles on three-tenths of a gallon, which represents 187 miles per gallon. The medal is won by Hal Hill (Bat), with Owen and Colliver (both Zeniths) equal second. Results:

A New Multi-spark and Anti-fouling Plug.

OF late years many attempts have been made to obtain a quicker combustion of the charge in the cylinders of petrol motors by igniting the gases from a plurality of

points, and also many attempts have been made quite independently from the multi-spark principle to produce a plug which is practically immune from sooting, fouling, or in any other way shorting across the spark gap, such as by the electrodes gradually drawing out and touching each other owing to the great heat.

Vertical section through centre of the Howard Smith sparking plug.

In the system of building up a plug in the way about to be described, even these chances of fouling up are reduced exactly 50% when two sparks are arranged for, and 66.6% when three are used, and so on; but it is doubtful if any better results are gained by using more than three.

The plug is provided with two (or more) electrodes, the firing points of which are situated as distant from one another as possible. In the case of dual sparks being required, an insulated electrode is secured in the body of the plug in the ordinary manner, which leads from the high tension wire, and this is so shaped that, instead of sparking on to the shell of the plug, it sparks on to a second elec-

trode or conductor, which acts purely as a "bridge" to carry the current from one side of the plug to the other, where it is arranged so that the current again jumps another gap, and sparks on to the metallic body of the plug, and so to earth.

This bridge can be made in several ways which are covered by the patent.

It is obvious that if one wishes to obtain the best results from two sparks instead of only one igniting the charge in the cylinder, one must get these sparks as far away from each other as possible, and therefore it is desirable to have the plug as large as is convenient. The writer has for some time been using one so large that it screws directly into the valve ports of the cylinder, thereby obtaining two sparks situated 1¼ in. to 1½ in. from each other. As this is not practical, however, from a commercial point of view on account of so many sizes having to be made to suit various engines, the advantages in this direction have to be somewhat curtailed in order that it can be made standard size to suit all engines alike.

The reason that if shorting across one of the points occurs it does not render the plug *hors de combat* is because the current, although it has no gap across which to spark, nevertheless passes over from the one electrode across the bridge and sparks at the other end, so it will be seen that if one spark gap is shorted it will not cause the plug to be inoperative, but it will still continue to spark at the second gap.

In addition, for the above-mentioned reason, a cooler engine ensues, and also on account of the combustion being slightly more rapid the exhaust valve

retains its seating, and does not become burnt up and pitted so quickly because it is not exposed to the hot flame of the burning gases to such a marked degree as when only one spark is used.

The plug is not at present on the market, as it is only in its experimental stages, but the writer has had one in use for the past three months which has been subjected to some very severe tests. He has had sufficient confidence in it to use it in several hill-climbs and speed events, in addition to ordinary road work, and its behaviour has been all that has been expected, whilst he has also had good reports from friends who have been using the plugs and endeavouring to run them to destruction in order to find out their weak points, but so far they have all stood up to their work and no trouble has been experienced with them.

The illustration shows a section of the plug as at present made; it is, however, proposed so to modify the shape of the electrodes as to cause any oil that may collect upon them to run from the points, thus obviating the possibility of any short-circuiting.

Also it is intended that the second, or bridge, electrode should eventually be fixed in the non-conducting body in a different manner, and not project through the top, as shown, as there would hardly be room for this in a plug of standard size. The inventor is Mr. Howard Smith, of Four Oaks, Warwickshire.

It will be seen from the above description that there are great possibilities for this plug, and we hope shortly to be able to report upon its behaviour after a practical trial.

Change of Address.

Messrs. Price and Co. (late of 25, Rosebery Avenue, E.C.), the makers of Ukantes specialities, have removed to London Colney, Herts.

Third Successive Team Award.

The prize won by the P. and M. team in this year's Thousand Miles Trial is the third team prize this firm has won in succession.

Coming Along.

We are informed that the C.A.P. carburetter was fitted to machines which gained two firsts, two seconds, two thirds, one fourth, and fastest time of the day at the Newnham hill-climb on Saturday, September 2nd.

Fire Causes Delay in Delivery.

Osborne Bros. inform us that the fire at their Lincoln premises on the 23rd ult. will cause some delay in delivery, but that customers who have machines on order will receive delivery as early as possible, as they are making arrangements for the manufacture of the machines elsewhere.

A Manchester Reliability Trial.

The reliability trial promoted by the Manchester M.C., for which the first award was the Triumph Challenge Cup, was won by W. Heaton, of Atherton, riding a 2½ h.p. A.J.S. lightweight. Twenty-two competitors took part, and fifteen completed the journey without a stop, the deciding point in the competition being a hill-climb.

Another \$5 Lathe.

Another firm to introduce a moderate priced screw-cutting lathe suitable for motor cyclists who do their own repairs is F. Patrick, of Oxford Street, Leeds. The "Patrick" 3½in. centre lathe is a self-acting boring, sliding, and milling tool with a 3½in. bed, gap 3½in. long and 2½in. deep, and saddle 8in. x 6in. The lathe will admit work over the bed 7½in. in diameter, over saddle 5½in., in gap 12in., and between centres 22in. Complete with treadle it weighs 220 lbs. The approximate weight as a bench lathe is 140 lbs.

**A New Rubber Belt.**

The Service Co., of High Holborn, W.C., have recently introduced two new motor cycle belts, which we have had an opportunity of inspecting, and of which we have been able to form a very favourable opinion. The first is a rubber

Two new belts just introduced by the Service Co. The top one is a rubber belt and the bottom one is made of leather.

belt in which a special device, consisting, as it were, of a number of "pimples," has been introduced to ensure a thorough grip on the sides of the pulleys. At the same time flexibility has been made a strong point, and to this end the under side of the belt is furnished with a number of transverse grooves. In all rubber belts there is a tendency for the top surfaces to crack and come away from the canvas core. In the Service Stud

Belt, as this new introduction is called, the top surface is embossed with a basket pattern, which, while not detracting in any way from the flexibility, nevertheless allows the belt to be bent to its utmost degree without causing it to crack. It is made in all sizes suited to standard pulleys from 2in. to 1½in.

A New Leather Belt.

The same firm have also produced an improved pattern of their leather belt. The tension between the engine and the back wheel belt rim is taken by three plies of chrome leather, above and below which are a series of square pieces of untanned hide, the function of which is to enhance the gripping surfaces of the pulley flanges without adding any more thickness to the material which has to be bent around the pulley. On the top of the upper leather pads are square pieces of coppered steel, through which pass hollow rivets which hold the plies together. The steel plates form an effective bed for the rivets, and, as a result, the belt appears likely to be enhanced both in durability and life. To take one of these belts in one's hands is to realise what a high degree of flexibility has been obtained by this simple and effective process of manufacture.

Dunlop Belt Sales Arrangements.

In future the Dunlop belt will be handled exclusively by the Dunlop Tyre Co., whose headquarters are at Aston Cross, Birmingham.

Club Notice Boards.

Mand's Motor Mart are placing a club notice-board in one of their windows at 136, Great Portland Street, W., and would be pleased to display any club notices for London and district clubs.

Catalogues Received.

Mr. G. N. Higgs is distributing a small leaflet telling what the Aleyon lightweight has done in three months. Copies can be obtained on application to 31, Vauxhall Bridge Road, S.W.

The Hutchinson Tyre Co., 70, Basinghall Street, E.C., have just issued a new catalogue.

The Hull and District A.C. hill-climb was run off on the 2nd inst. Our illustration shows competitors weighing in before the start.

of the
B.S.A.
Motor Bicycle*

"POWER, COMFORT, RELIABILITY."

"I have just returned from a Cycling Trip in North Wales, and wish to congratulate you on the excellence of the B.S.A. Motor Cycle used. This machine (which has completed 2,000 miles) took a sidecar (passenger and self exceeding 22 stone in weight) from Birmingham through Bettws, Capel Curig, Beddgelert, etc., singly geared, without failing on a single hill, and has proved most satisfactory as regards its power, comfort, reliability, and general excellence.

"I have had single, twin, and 4-cylinder machines of various makes, but none to equal your 1911 3½ h.p. Roadster Model."

"B.D.," Edgbaston, August 29th, 1911.

THE B.S.A. MOTOR BICYCLE

is recognised as the most perfect machine on the road. Its distinctive finish, its silence, power, and smoothness of running are points that are fully appreciated by those who have ridden other makes.

The Finest Machine
in the World for

Design, Workmanship, & Finish.

Read this:

Dear Mr. Reed,—I write to tell you that on Sunday last I left here at 5 a.m. in the morning for London on the Dot with Sidecar, passenger, and luggage, intending to do the return journey during the day, which I am glad to say I accomplished without the slightest trouble save a puncture in the back wheel. This says a lot for the reliability of your machine, as in order to do the 350 miles in one day I had to travel at a very fair speed. I had absolutely no cause to open the tool bag. The J.A.P. engine ran magnificently, and in spite of being geared four to one took Birdlip on top, on the road to London. Coming back I actually passed several Solo machines blinding up Dashwood.

This I consider a wonderful performance, for as you know I have a very heavy sidecar and by no means a light passenger.

So far as I am able to ascertain no sidecar combination has yet done this journey from Cardiff to London and back in one day.

Yours very sincerely, ERIC LONGDEN.

MANUFACTURERS AND PATENTEES—

MAUDES' MOTOR MART,

For address, see opposite column.

WE DO IT.

We HAVE advertised, ARE advertising, and ALWAYS INTEND to advertise, that we send ALL goods on APPROVAL, against cash, and if not satisfactory they can be returned and the cash refunded IN FULL. We have been advertising on these lines for over TWO YEARS, and yet every post brings us 20 or 30 letters asking if we send machines on approval, and, if not satisfactory, do we return the money. These people are either UNBELIEVERS, or else they have been "had" in the past. WE DO everything that we say WE DO, and it gives us as much pleasure to return a cheque as to receive one, as we know that immediately a man has received the money back, he at once becomes a WALKING ADVERTISEMENT of the straightforward dealing of Hitchens, of Morecambe. We find that one cheque returned to a district has increased the trade of that district enormously. It does not matter whether the goods you purchase are 5/- or £50; if you don't like them, send them back to us and have your money back in full. SOME FIRMS will offer to SEND YOUR MONEY BACK and take out 5% for the trouble they have had in negotiating the deal. Hitchens, of Morecambe, risks the 5%, and considers that the trouble taken is recompensed by the advertisement obtained in returning the money, where this is necessary. We have explained many times that we are not philanthropists, and although our system of business may appear somewhat philanthropical, yet it is of a paying character.

HONESTY is the BEST POLICY at all times, and there is a proof of it in the enormous increase in our trade, and the thousands of satisfied customers that we have in all parts of the world. We can produce a drawer full of testimonials of the straightforward and upright treatment that our clients have received at our hands. EVEN YET, we do not please EVERYBODY, but we want to please you; therefore, send along your postcard for a new list. Note the terms—Cash, Exchange, and, under certain circumstances, the Deferred. We are ESPECIALLY ANXIOUS for cash offers, as we want to reduce the stock before going to Lancaster next month; therefore, cash offers will receive our most favourable consideration.

HELLESEN

World Famous

Dry Batteries.

MOTOR
CYCLE
SIZES

FROM
6/6
EACH.

UNDOUBTEDLY

the most reliable dry battery made—proved by the fact that not only are they used by the British but also by several Foreign and Colonial Governments.

SAVE MONEY

by installing on your motor cycle or car

The H.H. HELLESEN DRY BATTERY SYSTEM

you will find it far more satisfactory than acid-filled accumulators, for not only is the "HELLESEN" cheaper in first cost but it costs you nothing whatever to maintain—in fact after once fitted you need not give it a thought.

REMEMBER THAT

a special coil is not always necessary, merely send us brief particulars as to the ignition as now fitted on your motor cycle or car and we will advise and help you willingly and gratis too.

Illustrated catalogue on request.

2 h.p. Minerva, nearly new condition, accumulator, 4 Longuemare carburetter, carrier, complete outfit tools, Lucas head lamp, new spare tube and plug; £10.—2, Fildemore Cott., Holmby St. Mary, near Dorking.

4 h.p. Scott, 1910 model, in the very pink of good condition, lamp, speedometer, horn, watch, electric lamp, ready for the road; immediate clearance price, £45.—Seen at Wanchop's, 9, Shoe Lane, Fleet St., London, E.C.

TRIUMPH, 1910, condition like new, guaranteed perfect order, carefully ridden 2,500 miles, all accessories, spares, horn and Lucas headlight; £36, no offers or exchanges.—Davy, "Woodbury," Tonbridge Rd., Maidstone.

A.P., 1911, 4 h.p., new July, latest 4-speed model. Bosch magneto, spring forks, B. and B. Clinchers. X'all anatomical saddle, all spares, cost £52/10, not done 500 miles; bargain, £35, nearest.—23, Aberdeen Rd., Highbury, N.

F.N., 5-6 h.p. (July, 1910), latest automatic carburetter, automatic lubrication, footboards, new Rom tyre, Solar headlight, horn, mirror, watch, all tools, spare tube; £34.—Joseph Patterson, Woodville, Farnham, Surrey.

TRIUMPH, late 1910, standard model, almost as new, has had very little use, enamel and plate scratched, complete with all accessories; only requires seeing, any time convenient; £40.—Rigby, Rosetta, Brighton Rd., Purley.

5 h.p. Sarolea, Chuter-Lea, h.b.c., adjustable pulley, Palomares, Longuemare, footboards, long, low, and sidecar; any trial; what offers, with or without sidecar, or exchange for lower power lightweight or 2-seater.—444, Fulham Rd., S.W.

TRIUMPH, 1910, a really good machine, carefully handled, only reason for selling bought car, new tyre, other run 200 miles, engine overhauled recently, new belt and spares, lamp, usual accessories; £36.—83, King-ton Rd., Wimbledon.

£55 for £35—May, 1911, Ariel, 3½ h.p., variable gear, free engine, footboards, lamp, horn, new piston, quite perfect, vibrationless; seen and tried after 6 p.m., appointment necessary; no offers.—Douglas "Walcot," Blyth Rd., Bromley, Kent.

3½ h.p. Minerva, Chuter-Lea No. 6 frame, spring forks, 32 h.b.c., 2½ h.p. tyres, £12; 3½ h.p. Brown, magneto, spring forks, h.b.c., £15; both these machines are in sound running order, and may be tried and seen any time.—Rowley, Beverley, Leigham Court Rd., Streatham.

TRIUMPH, 1910, free engine, fitted with horn, lamp, generator, and spare Watawata belt; £39; also Mills and Palford motor wheel sidecar, fitted unsprung Dunlop non-slipper cover, 5 guineas; no offers; seen without appointment.—C. Moss, 1, St. George's Mews, Primrose Hill.

Brakes and Stopping Power.

THE question has often been raised whether it is better to have the two brakes, which are by law required for a motor cycle, both on the back wheel or one on each, and in our opinion the question admits of only one answer, viz., that each wheel should be braked. This has been suggested by reading a sentence in an article describing a tour in the West, and at this time of the year, when new designs and novel patterns are on the *tapis*, and makers are endeavouring to improve their machines, a few lines on the subject may not be out of place. A single brake is quite sufficient to lock the back wheel if it is a powerful one, and if both brakes are fitted to the rear wheel, as is often done owing to the difficulty of fitting brakes to spring forks, then the second brake is of no use unless the first one fails, which it is not likely to do if it is properly made. Another point, and one worthy of notice, is that if two rear wheel brakes are fitted one will in all probability be a band brake, and this type—while it must be admitted that there are some few excellent examples on the market—has not upon the whole proved itself to be satisfactory on motor cycles, and it cannot be denied that in any case it makes the removal of the back wheel when a tyre has to be changed more difficult and troublesome.

In some brake tests on pedal cycles held a good many years ago it was found that a front wheel brake had a greater retarding effect than one fixed on the back wheel, because the result of applying the brake threw the weight forward, and this will apply also to a motor cycle, but in a lesser degree, owing to the greater length of the machine. Front brakes, however, are not in themselves so powerful as those

fixed to the back wheel. It is much better from all points of view to apply brakes to both wheels gradually than to retard one wheel only by the violent application of a powerful brake. It has been found, too, that front wheel brakes are most desirable for cars.

Of course, it is most important that the front wheel of a motor cycle should not be locked, as that would mean instant disaster, and no good brake should be powerful enough to do this, or at least every rider should be on his guard lest such a thing should happen. It is quite a mistaken idea that the wheels should be locked to gain the greatest retarding effect, for as soon as the wheel ceases to roll and begins to slide over the road the grip of the tyre becomes less effective.

It is well known that the co-efficient of friction is less when the bodies in contact have begun to move. The truth of this statement can easily be verified by allowing a book to slide down a sloping desk, when it will be found that if the book is given a slight movement by hand it will slide down a more gentle slope than if it is at rest and the top of the desk gradually raised until it begins to move. In fact, everybody knows this but often without realising it, for what is more natural when trying to pull a cork out of a bottle than to give it a twist round at the same time. Most people, even teetotalers—but in their case it would be a medicine bottle—will do this without giving a thought as to the reason why. The greatest retarding effect is obtained when the wheels are almost, but not quite, locked. Therefore the wise motor cyclist will never lock his wheel intentionally, partly for the sake of his back tyre—which deserves some little consideration, as it has to transmit the whole driving force to the road—but also for the reason mentioned.

In Wales and the West.

THIS tour was originally planned as a "camping" expedition, as we intended to carry a small tent and all necessities with us. The idea was only abandoned on the ground of initial expenditure, and as events turned out the change in our original plans was fortunate.

A few words as to our machines, equipment, etc., may be of interest.

My companion's machine was a 1909 two-speed Humber and mine was a 1909 3½ h.p. Rex de luxe, and many times did we bless those two-speed gears. I have toured on a single-gear machine and fared very well, but for hilly country and unknown roads, grease and traffic, convenience of starting and weight-carrying capacity, I would not be without my two speeds.

We were very completely equipped, for, besides a fortnight's supply of clothing and extras, we had each a large box in which were packed spirit stove, spirit, saucepan, aluminium tumblers, tea, and various jars and implements—we believed in doing our touring in comfort. Each machine was fitted with a Stewart speed indicator, and both carried a good outfit of tools and spares.

The total weights are interesting. My friend's machine 280 lbs., rider 168 lbs., total 448 lbs. My machine 274 lbs., rider 156 lbs., total 430 lbs.

First Day.—Sheffield to Newport (Salop), 72 Miles.

After weeks of preparation we were at last ready, when, just as we were about to start, my engine had a sudden severe fit of misfiring. Having put this right, we had our photograph taken, and at the word "Go" the engines roared, took up the drive, and away we went to meet many adventures.

It was a hot summer afternoon, and as we began with a few miles of uphill my engine (which was running a new piston in) soon overheated, but the low gear took me to the top all right, and then we had our first long free wheel down into the pretty little village of Baslow. The roughness of the road made steering rather difficult at a speed of forty-two (as registered by the indicator). Through Baslow, Bake-well, and then away over the hills to Ashbourne, and—down went my back tyre. Examination showed that it was a leaking patch, and as circumstances made a repair almost out of the question I put in a new butt-ended tube. Then we had another grand run down into Ashbourne, and an uneventful ride through pretty country to Uttoxeter, Stafford, and Newport, where, as it was getting dusk, we decided to remain for the night instead of going on to Shrewsbury as had been originally intended. A flower show in the town caused us some little difficulty in finding accommodation, and then—well we were hungry and tired!

Second Day.—Newport to Aberystwyth, 100 Miles.

A dull morning; but immediately after breakfast we started, and soon my engine began misfiring worse than ever, so I tried A's spare contact breaker

A SUMMER TOUR.

and all was well. The trouble was subsequently found to be due to a worn platinum point.

Immediately we passed Shrewsbury we began to see the mountains in the distance, and then we reached Montgomery. All who have travelled this way will know what a beautiful approach there is to the town. High hills rise up in front as if to bar the way, and the straggling little town lies half hid in the trees on

the mountain side. The road then winds away at the foot of tree-covered hills, and, though somewhat sinuous, has a fine surface. As we sped along on the straight at a good pace and then slowed round a corner, I found A just extricating himself from his machine on the ground. In avoiding some sheep, he had applied the brakes too suddenly and lost his equilibrium. We soon fixed up the damage to the great interest of a crowd of Welsh children, and then ran on to Newtown. At lunch time we had some rain, and then I punctured, a small nail having eluded the thorn-catcher. A "Holdrite" patch soon mended it, and on we went, up hill and down, by many streams and tree-clad mountains. After passing Llanidloes the road alters, and gives a chance for the men with big engines, being well engineered and mostly straight, though a bit loose in places. Mile after mile of rise taken at 30 m.p.h. overheated my engine, so I stopped and took a photograph.

But who shall tell of the free wheel down? And how a free engine scores. Kick out the clutch and away you fly! The road is perfect and speed unnoticed as the finger creeps up and up and is now at forty-five and quite steady. Then round innumerable corners, but never a sign of life—mile after mile of bleak and barren hills of loneliness and silence. At last some hotels and the turning for Devil's Bridge, but that is not our road to-day, so we keep to the right, and anon the country becomes more hospitable, trees and valleys, rivers and sunset all lie spread before us in a panorama of beauty.

The last few miles into Aberystwyth are soon covered, and who shall do that ride right through the heart of Wales and not rejoice? Beautiful and quaint Montgomery perched on the hillside with mountains waiting as it were to overwhelm it, perfect roads and weather through grand scenery, and the sensation of flying downhill with the engine "out" all combined to make us feel at peace with all the world.

Third Day.—Aberystwyth to Fishguard, 58 Miles.

We left Aberystwyth about noon and found it very warm. For sheer joy of riding and living I do not remember a day to equal this in all my experience. We were in hilly country, and riding for miles by the sea—deep blue sea and deep blue sky. Up hill with a roar and down hill in free engine and silence; the joy and exhilaration were so great that I must needs call out greeting to all and sundry whoever they might be.

In Wales and the West.—

Again my tyre went down and was cured by a new valve rubber. On through Aberayron and Cardigan, and a few miles further I stopped at a farm to ask for some cream. They filled my bottle, and when I asked "How much?" replied, "Oh, nothing." Nor would they take anything. "A" wanted to take the little girl for a ride on his carrier, but she evidently disliked the look of him, and declined. We soon found a little stream, and spread out our "encampment" and made tea.

I fitted a larger jet when we restarted so as to be ready for the hills of which we had been warned. The engine romped up all we met.

We neared Fishguard, and had been led to expect a pretty bad hill; and it was—I can vouch for that. It is called Dines, and leads into Lower Fishguard. There was a cart in the middle, and in reply to the very audible warning of my approach the driver pulled into his wrong side. This necessi-

We spent the night at Fishguard and just missed seeing the *Mauritania* come in and go again.

Fourth Day.—Fishguard to Tenby, 66 Miles.

In the morning I finished patching up before going across to inspect the harbour, which impressed us as a great piece of engineering; a good deal of it having been blasted out of the granite cliffs.

We departed amid the lamentations of the people at the hotel—or at least of some of them—and soon reached St. David's, which is a very deserted looking place, whose chief feature seemed to be a large cross standing in the centre of the town. We were here to find that there were seventeen hills in the next sixteen

miles, and, without actually counting them, I am inclined to believe it! We played at switchback for a while, and stopped at the bottom of the steep hill at Newgale. A car came along and essayed to climb the hill, but failed, and tried again and again, but, in spite of smoking like a factory chimney, it could not manage

(2) At fresco luncheon near Cardigan on the third day.
(4) Ilfracombe and harbour from Hillsbro' Hill.

(1) The start from Sheffield.

(3) Which way? Rough going in South Wales.
(5) Ilfracombe from Capstone.

tated a very sharp swerve on my part to cross behind him, and my long footrest caught on the side and pitched me off on to my head, which, being hard, saved me from injury. The gradient here was 1 in 5. The damage was a broken lamp and bent footrests. As these latter carried all the brake and gear pedals it was necessary to take them all off and set to work to straighten things out. This I did with the aid of a cottage fire which I used as a forge for the nonce. "A" in the meantime making himself very popular with the children. The repair of the footrests, etc., took about four hours, as the tube had to be filed till the pedals would revolve properly. This experience would again prove the desirability of makers fitting all gear and brake controls on separate studs.

the climb. In order to show what a motor cycle could do, I just turned round to face up the hill, gave my handle a turn, the engine immediately responded, and I started on a fairly steep part, and went up to the top without an effort.

We now followed the coast for a while, and soon left the main road for Broad Haven. We were now out in the wilds indeed. Rough and curly roads about 10 feet wide, with many sharp corners and fearful hills, were the order of the day. The road was so thickly strewn with stones in places that we were glad to run on our low gears for some distance. There was never a signpost, and when we met a fork in the road we had to scour the surrounding country to find a farmhouse whence we might be directed. The photograph

In Wales and the West.—

"Which Way?" reproduced was taken hereabouts. Having lunched, we got under way once more, and soon turned on to some better roads, and got to Haverfordwest and on to Neyland, where we put our motors on the little ferryboat and were taken to Hobb's Point. We disembarked on a very steep slip-way, and some loafers wanted to "shove them" up, but we said we were not going to do anything of the sort, but were going to drive up. The man thought it was a good joke, and winked and smiled to his companions, but the smile changed to a stare of astonishment when we both set our engines buzzing, and then, engaging the low gear, went flying up with increasing speed. Twenty minutes later we were in Tenby, after a welcome improvement in road surface.

Fifth Day. — Tenby to Cardiff, 94 Miles.

This is a day that shines by contrast. As we had to be at Cardiff on the following morning to catch the boat, we had to make certain of arriving that night. The morning was dull and wet, but cleared enough for us to go over the castle hill and enjoy the views. We were altogether delighted with Tenby, and hope to renew our acquaintance at leisure.

The roads were very bad as we left, but soon improved, and after a few miles were quite dry, and enabled us to make good time. At lunch some very inquisitive cows were inspecting our machines, and I actually found one with its nose in "A's" lamp! The lunch stop proved our undoing, for, before we had quite finished, it began to rain, and then it poured in torrents. I got wet and my magneto got wet, and the engine was consequently difficult to start. We were driving in the teeth of the storm, and the South Wales coalfields are not pleasant on a wet day. We avoided Swansea by going from Morriston to Neath, with its queer gas-engine-propelled trams. Then my belt slipped, and had to be shortened, and meanwhile the magneto got wet again and the engine would not start. When a loud explosion occurred in the silence, the inevitable crowd of small boys fled in terror, greatly to "A's" amusement. Half a mile further my pulley flange unscrewed and the magneto got wet again, the rain descending in a perfect torrent.

But now follows a brighter chapter. The rain slacked off a bit, and the road became straight and level, and had been tarred for many miles. In places there is a mile, or even two, in a dead straight line, and the indicator went 30—35—40, and kept steady. Then I met "A," who had been waiting, and we did the last nineteen miles together. The road was, if possible, even better, and we let the engines "rip," and up went the pointer as before, and even a little above that, and kept steady at forty-five for several miles; then a corner and on again; on—on—on, in

sheer joy of speed, making some atonement for past discomfort. The milestones were soon hopelessly out of count; they went from 11 to 8¼ and then to 4, and now we are in Cardiff, and a feeling of peace, innocence, and righteousness steals over me as the indicator drops to fifteen and the engine goes as sweetly as can be. The last twelve miles were done in twenty minutes, and we and the machines were mud from top to toe.

Sixth Day. — Cardiff to Ilfracombe and Porlock, 37 Miles.

It was still raining when we got up, but soon the weather improved very considerably. Our next move was to catch the 9.30 boat for Ilfracombe. This I did with a struggle. "A" wheeled his machine up the gangway on to the boat quite easily, but when I got there I found that my foot-rests were too long to go up the gangway, and there was nothing for it but to get about six men to hoist the machine on their shoulders and carry it bodily on board, I fearing every moment to see it disappear into the water. However, to my relief, it was at last safely on deck, and by and by firmly tied up to the paddle box to be

out of the way of the waves, which kept washing over the decks. The crossing was very rough and the boat pitched a good deal.

A glorious sail of about three hours brought us to Ilfracombe, and in order to get off the boat it was necessary to get our motors on to the top of the paddle box, and then, waiting for a downward movement of the ship, make a rush at the gangway (which was fortunately wide enough for me here), and then the succeeding rise of the ship shot me down on to the pier almost in a heap—quite an exciting method of disembarking, as all will admit.

Sunset at Ilfracombe, after crossing from Cardiff.
The Land's End.

In Wales and the West.

In the town we bought Devonshire cream and butter, petrol, and dough cakes, and when we talked to the man at the garage and told him where we were going he seemed quite surprised! The coast scenery is magnificent all through North Devon and Somerset, and we only regretted that we were not able to stay in that district longer. Its hills are well known. We went gingerly down into Parracombe, and stopped at the bottom of the hill. Here we met two other motor cycles, about the sixth since leaving Sheffield. One was a twin Enfield and the other a twin Minerva with two men on it—one on the carrier. They looked as if they had been through some exciting experiences!

The hill out of Parracombe presented no difficulty to two-speeded machines, and we soon arrived at the famous—or infamous—descent into Lynmouth. I don't know the actual gradient, but heard some tall stories of it! The hill certainly deserves all the bad things that have been said about it. The gradient is terrific and the surface a mass of mud and loose stones, and the last corner is a terror! Being in the unfortunate position of having no front wheel brake, I had some difficulty in getting down in safety; about the best thing to do seemed to be to lock the back wheel, keep in the soft part of the road, and slide. The next hill, Countisbury, was reported "not quite so bad," and certainly it did lack a corner comparable with the last, so under protest I agreed to try it. I let "A" start first, but passed him in a few yards as

his low gear was slipping, and then my belt slipped, and I had to get off and take a link up in the fastener. I put a stone behind my wheel to prevent the machine from running back, and made a fresh start, but accidentally stopped the engine in throttling it down, and so had to repeat the performance. Some attendant small boys were very anxious to push me up, and I was advised to get a start by a gateway a little higher up, but I determined to go from where I was, so I raced the engine a bit and put in the low gear, and the Rex took up the drive, and, though I was on the steepest part, sailed up to the top without a falter and without any acrobatic performance on my part. I walked down the hill and found "A's" low gear still slipping, so gave him a push off, and then he got up all right.

We now rode along the edge of a mighty cliff with an almost sheer drop to the sea, and stretching away into the distance was the bay and other headlands, and over all a brilliant sun—altogether a glorious sight never to be forgotten.

On the first part of Porlock "A" punctured with a stone (of which more anon). "Hurry up," I said, "and slap a patch on"; and then I found my tyre was punctured too! After mending these we went carefully down that famous and fearful descent into the charming little village of Porlock, and here we decided to stay the night, and made ourselves very comfortable.

(To be continued.)

A NEW SIDECAR FITTING.

Messrs. Maude's Motor Mart, 136, Great Portland Street, London, W., have introduced a new and instantaneously detachable sidecar fitting which we illustrate herewith. It will be noted that it is not necessary entirely to withdraw the bolt (which makes it much less liable to be lost), as there is a slot in the permanent fixing which allows it to slide out when

partly unscrewed. Three and a half complete turns are necessary before the boss clears the recess; it can also be screwed up by hand. Messrs. Maude intend putting this clip on all their 1912 models.

It is certainly a neat and ingenious attachment, and should make an appreciable difference in the time taken to fit or detach the sidecar.

NEAT BRACKET FOR SPEEDOMETER DRIVE.

The special speedometer gear box clip illustrated was designed primarily with the object of overcoming the necessity for adjusting the gear wheels each time the front wheel was removed. It was found that when the ordinary clip was fitted to the Triumph it interfered with the method of securing the front wheel hub. Having decided where it was to be fixed, it became apparent that a stronger support could be used, with the added advantage that the operation of removing the wheel could be performed without moving

the clip or altering the adjustment of the gear driving mechanism in any way. There is no reason why all speed indicator brackets should not be designed with the same end in view, for it is an untold convenience. We noticed this fitting on Mr. D. K. Hall's machine, and the owner willingly allowed our artist to make the sketch reproduced.

FORMULÆ FOR HILL-CLIMBS.

The question of a suitable formula for motor cycle hill-climbing competitions still continues to occupy the attention of engineers and mathematicians, and it is with the object of evolving an up-to-date formula, fair to all classes of motor cycles, that we give the examples below, calculated on a number of different formulæ, together with some brief notes as to their merits.

IN view of the many hill-climbing formulæ which are at present being used, it will be interesting to apply some of them to the placing of the same men and machines in the same trial, and to ascertain what difference they make to the figure of merit and to the position (if changed) of the riders concerned.

For purposes of comparison, we will take Class 1 in the recent Coventry and Warwickshire open hill-climb at Newnham, and consider the positions of the first few riders.

The following table gives the weight of machine and rider (w), the capacity of the engine, the horse-power as given by the club's formula, the time taken to climb the hill (which was about one kilometre, or five-eighths of a mile, in length), and the approximate speed in miles per hour (v).

In possession of these fundamental figures, readers may judge for themselves which they consider the best performance, taking the h.p., weight, and pace into account:

		Engine		t .		v .	
		w .	c.c.	H.P.	secs.	m.p.h.	
$2\frac{1}{2}$	Singer	300	295	2.35	55.4	40½	
$3\frac{1}{2}$	Singer	383	499	3.76	49.8	45	
$3\frac{1}{2}$	Precision (1)	344	499	3.76	46	48½	
$3\frac{1}{2}$	Rudge	382	499	3.76	52.2	43	
$3\frac{1}{2}$	Rover	343	499	3.76	49.8	45	
$3\frac{1}{2}$	Precision (2)	333	499	3.76	48.6	46½	

Two Formulæ Give Similar Results.

The formula used in arriving at the results given below was $\frac{H.P. \times T}{W}$. This formula has been used for three

years by the Coventry Club, and is considered superior to the well-known A.C.U., or Professor Callender's, formula, $\frac{W}{C \times T}$, as the latter unduly favours the small engine propelling a heavyweight. The Coventry Club formula places a relative value on the length of the stroke, whereas the A.C.U. takes into account the cylinder capacity only; but it is a strange fact that the position of the first six remains unchanged no matter whether the Coventry Club or A.C.U. formula be used. Of course, the actual merit figures are different, and we tabulate them below to render this article complete:

Position.	Fig. of merit Coventry Club formula.			Fig. of merit A.C.U. formula.		
$2\frac{1}{2}$ Singer	4.34	545
$3\frac{1}{2}$ Singer	4.89	649
$3\frac{1}{2}$ Precision (1)	5.04	669
$3\frac{1}{2}$ Rudge	5.13	682
$3\frac{1}{2}$ Rover	5.46	724
$3\frac{1}{2}$ Precision (2)	5.58	728

If we bring in the square of the time and take $\frac{H.P. \times t^2}{W}$ as our formula, the revised placing and figures of merit will be as under:

$3\frac{1}{2}$	Precision (1)	23.19
$2\frac{1}{2}$	Singer	24.04
$3\frac{1}{2}$	Singer	24.35
$3\frac{1}{2}$	Precision (2)	26.67
$3\frac{1}{2}$	Rudge	26.85
$3\frac{1}{2}$	Rover	27.18

It will be noticed that both the Precision engines which made fastest times go up two places, the order of the other machines remaining unchanged.

The Result using a Car Formula.

The next table we give is calculated from the car formula used by the Coventry and Warwickshire Club, the hill-climbing formula remaining as before, viz.,

		$\frac{DSN}{16} \times \frac{t}{w}$			
$3\frac{1}{2}$	Singer	60.78
$3\frac{1}{2}$	Precision (1)	62.68
$2\frac{1}{2}$	Singer	62.91
$3\frac{1}{2}$	Rudge	63.87
$3\frac{1}{2}$	Rover	67.87
$3\frac{1}{2}$	Precision (2)	68.18

It will be interesting to give a few results calculated on the supposition that the power equals the cube

		of the time, using the formula $\frac{H.P. \times t^3}{W}$			
$3\frac{1}{2}$	Precision (1)	1,067
$3\frac{1}{2}$	Singer	1,213
$3\frac{1}{2}$	Precision (2)	1,296
$2\frac{1}{2}$	Singer	1,332
$3\frac{1}{2}$	Rover	1,353
$3\frac{1}{2}$	Rudge	1,402

This formula, it will be seen, gives greater prominence to speed and less to weight. In all these formulæ the cubic capacity can be used instead of the horse-power. And as the various classes are arranged according to cubic capacity, which is easily ascertained by the formula $.7854 \times D^2 \times S$, this method has much to recommend it. (The c.c. can be found without trouble from *The Motor Cycle* Cubical Capacity

Left-hand side of the new open frame single-cylinder Enfield described on page 960 of our last issue. Observe the footboards, chain guard, and front wheel support folded under the crank case.

Formulae in Hill-climbs.—

Table, copies of which may be obtained from the offices of this journal, 3d. post free.) .7854 is a constant, and need not be introduced into a hill-climbing formula.

Our Suggested Formula.

From careful calculations and considerations of results based on the many different formulae in use, we would suggest, as *The Motor Cycle* formula for hill-climbs, $\frac{D^2 \times S \times t^2}{W}$

The air resistance (as we explained last week) varies as the *square* of the velocity, frictional resistances on lubricated surfaces vary in the case of rapid movement as the *cube* of the velocity, but the power required for lifting the weight up the hill varies directly as the velocity, so probably t^2 is the best compromise, but we should like to hear our readers' views on the matter.

The above formula is suggested for single cylinders; a fair allowance for the extra friction in multi-cylinder engines would give $\frac{D^2 \times S \times N \times .9 \times t^2}{W}$ as a suitable formula for twins, etc.

For the sake of comparison, we give the placings of the class used as an example calculated from the above formula:

	Figure of merit.
$2\frac{1}{2}$ Singer	385
$3\frac{1}{2}$ Precision (1)	392
$3\frac{1}{2}$ Singer	411
$3\frac{1}{2}$ Precision (2)	439
$3\frac{1}{2}$ Rudge	453
$3\frac{1}{2}$ Rover	460

It is interesting to note that the best figure of merit obtained at the meeting, according to the suggested formula, was made in the lightweight class by a $2\frac{3}{4}$ h.p. three-speed New Hudson, and is 366, which tends to show the advantage of a good variable gear. Another point is that these last figures are very much nearer to one another than those given by the A.C.U. formula.

A THREE DAYS' CAMPING EXPEDITION.

THE illustrations published on this page were taken during a short tour which was recently made by Mr. D. J. Gibson, of Frinton-on-Sea, Essex, with a friend in the sidecar attached to his 7 h.p. Rex.

Mr. Gibson started from Frinton on the Wednesday, and travelled through Ipswich, Cromer, Sheringham, King's Lynn, Peterborough, Cambridge, and back again through Colchester to Frinton—in all a distance of 330 miles—in three days, riding six hours a day. Each night the tourists camped on farm grounds, and on one occasion—at Cottishall—had cause to be thankful to a Mr. Field for supplying them with necessary provisions, as it was early closing day and all the shops were shut.

The rider was practically a novice, having had delivery of his machine just four days before undertaking the ride, and only once previously having mounted a motor cycle. The weather was perfect,

which, of course, was a great help to the tourists, who had no difficulty whatever in averaging the legal limit speed. A heavy load was carried throughout, comprising a tent, mackintoshes, blankets, rugs, pots and pans, etc., in addition to the passenger, and Mr Gibson says he experienced no tyre trouble and no involuntary stop of any kind—and, further, he had no cause to effect any adjustments to the working parts, which speaks well for his Rex machine and the finished method in which they are turned out of the works.

A 330 MILES TOUR IN THREE DAYS BY AN UTTER NOVICE AND HIS FRIEND.
(See accompanying letterpress.)

A Short Autobiography of a Motor Bicycle.

MY EARLIEST EXPERIENCES.

I WAS made abroad and sent over in pieces to London, where I was put together. Never shall I forget the pride with which I first saw myself in the glass, resplendent with my long plated handle-bars and green tank, looking every inch the goddess that I was.

I was sent with some of my sisters to a large cycle shop in the City, where I was displayed in the shop window and ticketed at £32—a very low price, considering my first-class workmanship.

Days went by, and I saw my sisters sent off one by one for the summer riding, and at last I myself was carefully packed in a crate and sent off to one of the London suburbs. My owner was what they called a "City man"; at least he only took me out on Saturday afternoons and on Sundays. He treated me very well, and kept me nice and clean; but I gave him a lot of trouble with my leather belt. The number of rivets which he put into my belt was appalling, and how they did wear my pulley wheel! Then my points were always troublesome, and constantly required to be filed down and cleaned up. Punctures soon started, and finally my master got so tired of me he determined to get rid of me. I heard him tell his wife that really he could not afford both me and his baby, and so he had advertised me in a widely-read penny paper, as being for sale.

An offer soon came for me, and I was taken down to some engineering works to be tested. A good report was given of me, and after a few letters had passed, haggling over my price, I was taken up to London to be sent down by passenger train to a town on the south coast. On a dark November night I reached my destination, to be immediately put into the cloak room to be "called for." After waiting for an hour in eager expectation as to who my new master would be, I heard someone enquiring after a motor bicycle, and a young man came and claimed me. He wheeled me carefully and rather nervously out of the station and down a hill into the town to a shop. How well I got to know the inside of that shop in later days!

My New Lord and Master.

After a refreshing cup of petrol my belt was put on, and I was soon warmed up, and the owner of the shop, who did not know much about me, although he called himself an agent, gave my new master a few tips and explained my taps and wheel and brake. Then I was once more cautiously led out into the dark and through the town and on to a black stretch of open road, where I could hear the plashing of the waves on the beach.

My young master flooded the carburetter and raised my exhaust, and, pulling himself together for a desperate effort, ran me for a few yards, dropped the

exhaust lifter and leaped into the saddle. I was off at once, and shuddered as I realised by his touch that I was in the hands of an absolute novice.

I felt my handles convulsively gripped, and I could picture my rider with a set determined face peering forward into the gloom, lighted only by one candle lamp. Four miles up and down hill and never a change of my levers, throttle full on and no extra air. How hot I got! How I knocked up a long hill of 1 in 15 with my spark so far advanced! But I really think he was much too frightened to leave go of the handle-bars, and all he dared do was to switch off and on every few minutes. How pleased I was to reach the little village where my master lived! I was put away into a shed with a sigh of relief, but was not left alone long. A small crowd of my master's friends soon appeared to look at and admire me. One of them would get on me and start me off on my stand—goodness knows I was hot enough already!—but that was a trick of his, which I soon got to know.

The Inquisitiveness of Visitors.

The next day was a Sunday, and my master took me out on the coast road for a few miles. He drove me a little better than the evening before, and prevented me from knocking my inside out up the hills.

In the afternoon I was brought out again, and one of his friends asked to be allowed to try me. With a little hesitation, permission was given, and with the permission the strict injunction to mount at once on hearing the first "teuf," as my explosions are called.

The advice was taken rather coolly and with the air of one who had nothing to learn about motor cycles. The friend wheeled me out into the village street, and with a friendly wave to my master started running me. I had not gone ten yards before I had started, and expected him to leap into the saddle. But no! he rejected all advice and waited till I got a little speed on. Fatal mistake! After the first "shot" I was off like a hound from the leash, with him running by my side, making frantic efforts to switch off on the wrong handle and to raise my exhaust with the lever of my totally useless rim brake. One desperate effort to leap on me, and then a crash. How it hurt! We rolled together in the mud, he on his back with his legs in the air, and I scraping all the nickel off my handle-bars and the paint off my tank. My master came and tenderly picked me up, hardly daring to look to see what the damage was. He twisted me straight and tried to wipe up my tears of petrol which were pouring out of a broken feed pipe. I could see that he hardly knew whether to laugh or to cry, and I think he did both. I did not look much hurt, but I knew by the pains in my carburetter that I had injured

CLINCHER

DREADNOUGHT MOTOR CYCLE TYRES

Should be fitted to machines which are in continual use over all sorts of roads, and in every kind of weather. The rubber studded tread is designed to take advantage of any projection or inequality of the road surface, and thus gives the highest non-skid efficiency possible. The studs wear down evenly and (owing to the thickness of the tread) after they are entirely gone, the cover is as good as an ordinary round tread. Tyre upkeep is the bugbear of the Motor Cyclist.

N.S.U. 'SIX.'

The machine that gives you command of the road.

Powerfully built and engined, yet replete with every refinement which makes it sensitive to the control of the rider, fast and flexible, regular and smooth in running, this high-powered twin N.S.U. makes strong appeal to men of nerve and lovers of long-distance touring. It places the entire gamut of motor cycling enjoyment at your disposal. It enables you to disregard hills and other road difficulties, and to plan your journeys in accordance with your desires. Its reliability and endurance — proved by numberless users — will win through where others fail.

For sidecar work it is particularly suitable, and it holds the record for non-stop performances in the A.C.U. Quarterly Trials.

The marked flexibility of the engine and the simple control render it very manageable and therefore ideal for town work.

Write for full particulars, which will be posted to you on receipt of application.

ABBREVIATED SPECIFICATION.

N.S.U. twin-cylinder engine, 796 ccm., 75×90mm., M.O.I.V., gear-driven, high-tension Bosch magneto, new type carburetter, drive by rim. "V" belt. This machine can be delivered with either a spring frame or a rigid frame, the latter where the motor cycle is intended for sidecar work. New pattern spring forks, divided mudguards, automatic spring stand, separate tanks for oil and petrol of improved design, two powerful brakes, 26in. wheels fitted with 2½in. tyres, engine clearance 5in.

This motor cycle is delivered as standard, with an adjustable pulley, but, if specified, can also be supplied fitted with our two-speed gear and free engine apparatus to the engine shaft at a small extra price. Weight, 200 lbs.

A Short Autobiography of a Motor Bicycle.—

some vital part, and I never quite did myself justice after that accident.

My master had learnt a valuable lesson, and that was never to lend me again, even to his best friends.

Holidays and Hard Work.

A month's hard work followed. I was made to do journeys of 100 miles or more, for it must have been holiday time, as my master spent nearly the whole day with me, and with what pride he introduced me to his family, and how he boasted of my use in shopping for the household! What tricks I used to play him, too, on our shopping expeditions! Two hours in the cold one day I kept him waiting not 300 yards from my stable door. It was only an inlet valve trouble, but the whole of my carburettor was taken down and deposited in pieces on the road. I could always stop him every fifty miles regularly with my contact points until he got some really good ones, and not sham platinum that pitted frequently. But we had some good runs through different counties, and when I was in a good temper I could go as well as any other bicycle, but being a lady I was fickle!

One hundred and eighty miles was our record, with only belt trouble. But what belt trouble it was! I tore through two belts and kicked off the new one, and my master cut his finger and tore the palm of his hand over those ———, as he called them. But he would ruin my rubber belts by leaving them on all night, and this annoyed me very much. I would always crack them regularly where they left my pulley wheel. He could very easily have run the belt off every evening and on again for the morning run. The belt would have lasted twice as long, but he never realised that.

In the summer I was again taken down to the sea, and many an evening ride I used to enjoy in company with a Coventry machine with whom I could always hold my own when really in the humour.

A Late Supper and what followed.

One evening we set out for supper at a little town thirty miles off. Except for kicking my belt off three times in a mile, I was going very well. After a fine old castle had been inspected and a hill of 1 in 10 had been climbed with a standing start—I got up while my Coventry friend stuck—they stopped for supper, and started back at ten o'clock. It was very dark, but my master drove at a pace I did not quite approve, so I kicked my belt off once to show my independence. He had to stop and find it, but then in putting it on he had to lift up my brake pedal, and by mistake he left it disconnected. Having started again gaily at about eighteen miles an hour, I was going well, and in spite of the darkness and the twisting roads we met with no mishap until we came to a downhill road between two high walls. The road appeared to go straight for some distance, but, to my

horror, I saw a right angle turn with a low and villainous looking stone wall full in front of us. My master saw it as soon as I did and hastily put his foot on the brake, which was futile, and we careered to our ruin. There was no hope; it was impossible for my master to steer me round the corner, and so with a "Good luck, old girl," he slipped off behind and I dashed on, resigned to my fate. The agony I felt as I dashed madly into that wall I cannot describe. I plunged up a bank which guarded the wall, and with a supreme effort managed to twist my head away from the wall and so fell over on my side. There I lay, with my handle-bars looking round at the tank. Fortune was with me in the shape of a pair of foot-rests, one of which was twisted round my engine and had broken my fall. How I blessed my master for fitting them on, although he never used them. It was only five minutes before we got started again, and we reached home safely, but I felt very shaken. My master was very tender and kind to me, and made everything very comfortable.

My Third and Worst Mishap.

That was my second accident, and my third, which I was expecting—being a woman I am superstitious—came very soon, and proved the worst of all. It was very near my master's holiday—at least he was planning a long tour up North, and was wondering to himself where he and I would be in two days' time. Much trouble was spent on me, and I blush to confess to being painted. Thoroughly cleaned out, and fortified with copious draughts of refreshing oil, that evening my master proudly took me out for a mile or so to try some new arrangement of my dress which he called a new adjustment. We ran quietly through the village—where I was pleased to see that I attracted some attention—and up a side street on to the main road. As we turned the corner I saw a car coming very fast down the hill. We had time to cross the road, and my master steered me steadily to his proper side, thinking the car would, of course, slow down. But it was travelling too fast for the brakes to hold, and with a loud report of bursting tyres it crashed into us.

Ordered Abroad.

I was picked up from under the car in pieces, a battered, unrecognisable shape. Some kind friend—I recognised him as the rider who would not mount at once as he was told—picked me up and laid me by the road side, where I could watch the crowd that had gathered round my poor master.

I was laid up many days and weeks after this, and my master too. He thought we should never get on together again so well, and so we parted. I was always very groggy after this, and the convalescent home to which I was sent in London thought it would be better for me to try my luck with a new master in China or Peru, where my age and the marks of my chequered life would not be so easily detected.

TWO DAYS' RELIABILITY TRIAL IN THE NORTH.

A two days' open reliability trial is being organised by the Liverpool Auto Cycle Club on October 7th and 8th. We are told that it will be held under A.C.U. special permission, and it is the first open competition in the Liverpool district. Already some thirty local motor cyclists have promised their support, and as

soon as the A.C.U. permit is received entry forms will be issued. A fifty guinea challenge cup has been presented to the club, which will be awarded as first prize. The hon. sec. is Mr. Lionel W. Barton, Bee Hotel, St. John's Lane, Liverpool, from whom all information may be obtained.

LETTERS EDITOR

TO THE

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A New Design of Passenger Machine.

[5886.]-While riding my machine recently along the road between Hinckley and Nuneaton (Warwickshire), I noticed a most extraordinary contrivance approaching. As it passed I saw that it was a two-wheeled vehicle, the front part being like a motor bicycle, but where the saddle should have been there was a seat on either side of the machine, and again where the carrier should be there was another seat in the centre. It held three people altogether, a man and two ladies (the man driving from the right-hand seat). If any readers have seen this curious machine I should like to know what it was.

J. A. W. BOURNE.

The Terrors of Sutton Bank. Are they Exaggerated?

[5887.]-Having seen in the motor cycle press a great deal about "The Terrors of Sutton Bank," three members of our club—the Westmorland M.C.C.—myself included, determined to see for ourselves, and the other day we did so. The candid opinions of the three who tried it all agree that, as a hill, it is no class, and if the surface was decent it would do for a tricky speed trial.

We all three lowered our gears, and, without waiting for engines to cool, got up quite easily first attempt. Two of us had never seen the hill before, and are not impressed with it. Let some of the Sutton Hillers come over to Westmorland and try Kirkstone Pass from Ambleside—if they don't agree that it knocks Sutton Bank hollow I am very much mistaken—and we have a few other hills, Red Bank, Grasmere, Underbarrow, Scar, and Brigsteer Brow, etc. The three who conquered Sutton rode T.T. Triumph, Rudge, and Touring Triumph.

EC 513.

Military Motor Cyclists.

[5888.]-May I take up a small space in your paper with a few remarks upon the military motor cycling notes by "Celeriter" in your issue of September 7th.

Although, as "Celeriter" tells us, there are no manoeuvres this year as regards the army as a whole, still civilian motor cyclists are needed. Several were required for duty at Lewes on the 11th inst. (but were cancelled on the same day), whilst several more were also required at Aldershot on Sunday evening, September 17th, for a week.

This is the third year that I have been in a position to organise a number of motor cyclists for military work in connection with one of the largest motor associations of this country, and my experience is that, so far from any "strike" of motor cyclists, such as contemplated by "Celeriter," the number of those willing and anxious to serve as despatch carriers on manoeuvres grows bigger every year; probably because motor cyclists generally do not know what excessively hard work is, and what risks are run by those who take part.

The number of damaged motor cycles last year was enormous, and 6s. 6d. per day for petrol and oil—there being no pay—although it sounds generous enough, is, in reality, quite insufficient to cover the damage, and wear and tear, of a week on manoeuvres; and this is in spite of the fact that several riders were men in the motor cycle trade who would naturally take the utmost care of their machines.

It certainly seems extraordinary that the War Department should be content to employ men who are under no discipline, and who, if the weather were unfavourable (the last two years have been extremely fine as regards weather), could simply go home and leave the dispatches to carry themselves, and it is of the utmost importance for the good of the country and its adequate defence that a properly organised and armed corps of dispatch riders should be

formed, whose machines should be also properly insured by the War Department.

It is much to the credit of civilian riders that so many should have been found to give their services, still nearly all of those with whom I have come into contact have felt that on many manoeuvres they were decidedly "out of it" through not being military, and that, although they enjoyed seeing the manoeuvres, they were merely telegraph boys after all, with the addition of considerable risk and danger to themselves and their machines.

A RETIRED REGULAR OFFICER.

Sidecars and Change-speed Gears.

[5889.]-The photograph herewith is of my eldest boy aged fifteen on a 7 h.p. two-speed Indian with Millford sidecar, and was snapped on Newcastle Quay.

He is particularly keen on this "Indian" (he has a 2½ h.p. New Hudson himself), and out of the 7,000 miles it has done since I got it last March, he has driven it well over 2,000 of them, and can dismember, clean, and adjust any part of it. I always let him do the cleaning of cylinder heads, valves, carburetter, repair and replacing of tyres, tubes, etc. He drove me in one day (mostly raining) from Shap to Leyland (near Preston), and home *via* Blackburn, Clitheroe, Skipton, Ilkley, Harrogate to Newcastle, about 240 miles. I was not once in the saddle that day.

My "Indian" generally carries four of us, my wife and I, one boy age eleven on the carrier, and the other age six on a seat between his mother's knees in the sidecar, luggage and a two gallon tin of petrol.

In this way we went from Newcastle to London and back, in two days going and same time for return.

At 7,000 miles by the Cowey speedometer the engine is as sweet as ever it has been, and the machine generally is in perfect working order. There have, of course, been the usual sundry repairs and renewals due to ordinary or perhaps in this case extraordinary wear and tear.

W. B. ELLIS.

A fifteen year old driver of a 7 h.p. Indian and sidecar. (See accompanying letter.)

The Spider Quad.

[5890].—May we be allowed to correct a paragraph in the very interesting criticism of "Mug-wump M.D." It referred to our misadventure in the trials. Our dog clutch did not break—in fact, we believe that such an accident would be quite impossible. If a dog clutch is fitted without a friction clutch, it would be useless, but, as "Mug-wump" is no doubt aware, every first-class car, with the exception of the Lanchester, is now fitted with a dog clutch for its direct top drive. Our dog clutches are made large enough to stand any possible strain, and this form of drive is more simple and far more efficient than an epicyclic gear can be, and quite easy for a novice. Perhaps it will interest your readers, some of whom have so kindly taken an interest in our little car, to know what actually happened at the trials. The breakage was in the propeller-shaft from the engine to the gear box, which was built up out of a length of tube, and two end pieces which were pegged and brazed. The shaft so built was sufficiently strong for our one seater, but not for our two seater—at least on the Yorkshire Moors. We need hardly say that since the trials we have altered this part of our machine, and the accident will not recur. May we add that this is one example of the enormous value of these trials in the development of any new machine. The experience gained by them is not only useful, but absolutely necessary.

Before a machine is put on the market, it must be thoroughly tested, and these official trials are infinitely more valuable than any private trials can possibly be. No wise maker will shirk these trials because he feels that so severe a test may reveal defects. We have entered our runabouts for all the more important events, and, though we have not always won a gold medal (we have had our share), we have always gained what is still more valuable—experience which has enabled us to detect faults and to make improvements.

MORGAN AND CO.

Which is the Stiffest Reliability Trial?

[5891].—With reference to "Ixion's" remarks *re* Six Days' Trials, I am of the same opinion as he, that the Scottish Trials of 1910 were the severest which have ever been held for motor cycles, and having been a competitor in both, viz., Scottish Trials in 1910 and A.C.U. Harrogate Trials of 1911. I think I am justified in giving an opinion. I consider every credit is due to the Edinburgh Motor Cycle Club for the manner in which it conducted the trial and the judging of the machines at the end of the trial far exceeded in scrutiny and carefulness those of the A.C.U. just terminated.

Furthermore, I can thoroughly endorse "Ixion's" remarks with regard to the awards and gold medals given in the Six Days' Trials of the A.C.U. this year.

I should like to see a six days' trial carried out next year on the principle of toolbags to be sealed, competitors only being allowed to carry a tyre repair outfit and a set of levers. The accomplishment of this trial no doubt appears to be a difficult one, but I think it could easily be overcome by several official cars riding amongst the competitors, one car to leave the starting point each day fifteen minutes after the last competitor leaves. The principle of the trial would be on the "knock out" principle—i.e., should a competitor have a mechanical stop of any description, which he was unable to remedy without tools, he should be allowed to break open his toolbag, use his tools to put matters right, and then proceed to the point of starting of the day's run, to report, and take no further part in the trial. I do not consider it would be necessary to have a big mileage every day, say 100 miles, including several severe hills each day.

A trial of this description would be a far better test of reliability of the present-day motor cycle than those at present carried out. Machines would, of course, have to be standard in every respect, e.g., no two plugs fitted into one cylinder and such like fittings; then at the end of the trial, those machines which finish to be placed at the disposal of the judges for one week, to be thoroughly examined throughout.

I would suggest a course similar to the trials which we have just had, but competitors not to be allowed to cool their engines at the bottom of each hill, but to make a straight away ascent, and the hills to be observed not to be mentioned.

W. PRATT.

The Latest—A Speaking Tube for Tandem-seated Machines.

[5892].—I have oftentimes noticed and experienced the difficulty with which riders in tandem (whether on a car, tricar, or motor cycle) have of conversing one with the other.

May I bring forward an idea of mine which will, I think, obviate this?

As you will see by the enclosed sketches, it is a speaking tube of light metal, which clips on to the shoulder of the foremost rider. The horn ends can be turned in any direction, and can be extended. Conversation can be carried on quite easily, and it does not obstruct the view. It is protected.

ERNEST W. CLEGG.

Scorching.

[5893].—It is curious how seldom people take the trouble to notice exactly what is asserted in a controversial letter or article. If Mr. Hart-Davies reads my criticisms of the End-to-end record, he will notice that there is not one single aspersion on his own riding. I did not assist or follow him, and am therefore left to speculate from what I know of his ordinary riding, and from his lectures and newspaper articles. I have always believed that if any rider in England could be trusted to average 30 or 35 m.p.h. without endangering the public, that rider was Mr. Hart-Davies. But I did not tackle the question of these record rides in special relation to any individual. It is common knowledge that over thirty attempts were made within a single season not long ago, and several of the aspirants were totally unfitted for the job. I adhere to every word I said upon the general question, while I certainly admit that Mr. Hart-Davies could be trusted to reduce the risk to the minimum. Even thus I do not think Mr. Hart-Davies can absolutely eliminate risk, though I am sure he would rather run into a wall than collide with a member of the public. Mr. Hart-Davies lectured on his first record ride in Northampton by my invitation, and I happen to remember two statements in his lecture which show that even with a superb rider on the job risk is not wholly eliminated. He described a pretty lurid mix-up between himself and his followers round a blind corner, which the clump of them misjudged in the dark; and he concluded by saying that whether his existing figures were beaten or not, he should not essay the ride again, because "the risks were too great." Whether he meant risks to himself and his followers, or to the public, I leave him to explain. In either case his statement justifies the A.C.U. policy.

I believe that what is really irritating Messrs. Hart-Davies, Hugh Gibson, and Co. is the feeling that there is a cloud of hypocrisy overshadowing the R.A.C. and A.C.U., in that these bodies condemn speed feats in their corporate capacity, while their individual members frequently exceed the speed limit in their private capacities. The contentions of my last article show that there is a basic difference between a brief voluntary speed burst and a sustained speed burst rendered compulsory by the attraction of smashing a record. Here is an illustration. Up to date Mr. Hart-Davies has been able to minimise risks by perfect organisation, by good luck, and by thorough training. Somebody may presently put up a new record and average, say, 38 m.p.h. from End-to-end. Mr. Hart-Davies, if we may judge him by his former protestations, would probably have a third smack at the record, and might reach Exeter five minutes ahead of record, well fed, not at all tired, and very fit. On the other hand, he might reach Exeter a trifle behind record, and exhausted. One bad spill, one small failure

in his feeding arrangements, or a small miscalculation of his stamina, and he would reach Exeter in a condition which would render perseverance highly dangerous to himself and to the public. But it is more than doubtful whether he would abandon the ride so long as he could sit in his saddle and see even an outside chance of success.

B. H. DAVIES.

Business Methods. The Other Side.

[5894].—I see so many letters blaming firms for neglect and delay in delivery of spare parts that I feel I should like to give the Premier Cycle Co. a little praise in this direction. I wrote for a spare part that had to be specially made (my machine being an old one). I received same within a week, and the invoice enclosed was only 7d., including postage. Had the job been one of the most profitable—instead of what I feel must have been a humbug—I could not have been better treated.

BLACKPOOL.

[5895].—I am desirous, and shall be pleased if you will permit me, through the medium of your valuable publication, to pay a tribute to the firm of Messrs. Nye and Co., Leather Lane, and Gray's Inn Road, London.

For some considerable time I have had business dealings with this firm. I have confidence in them, and can honestly recommend them to any prospective purchasers of new or second-hand machines as a thoroughly reliable and fair dealing concern. Perhaps it is needless to state that I have no interest whatsoever in their business, being just a thoroughly well satisfied customer.

At the same time, I should like to speak in praise of the Service belt, purchased from the Service Co. of High Holborn. It has pulled my Triumph and sidecar for over 3,000 miles, and appears to be good for a long while yet. One of its chief features is the absence of slip in wet weather.

L. J. L. PULLAR.

The Quality of Modern Tyres.

[5896].—I thoroughly endorse the statement of your correspondent [5841] that motor bicycles are under-tyred.

The tyres are not nearly strong enough for the back wheel, especially when carrying luggage.

If manufacturers would realise that most people are quite prepared to pay more for a really reliable tyre there might be some improvement, but the ultimate solution will, probably, be found in a tyre constructed on different lines from those at present in use.

F. G. TALBOT.

[5897].—I was very surprised on reading letter 5885 to find the abnormal wear of tyres of the writer's machine, namely, only 800 miles per cover. Perhaps my experience as well will be of interest as a contrast. Machine, 1911 Triumph and rigid sidecar; tyres, ordinary Clincher studded on back and front wheels, Dunlop on sidecar. Total distance to date 2,838 miles, made up of rides all over Devon and Cornwall, average speed always from eighteen to twenty miles an hour, weight of passenger and driver always over twenty-one stone.

The Clincher on back wheel was not touched for 1,848 miles, when it was changed with the sidecar tyre. The Dunlop has now done 900 miles on back wheel, and the side studs are still quite visible. The front Clincher is in splendid condition. Have only had two punctures, nail catchers being fitted over each tyre. I am certain these same tyres will run for quite another 1,000 miles, when I shall have one retreaded for back wheel only.

C. C. WILSON.

[5898].—The various letters re faulty motor cycle tyres, particularly one in your issue of September 14th, by G. C. Pohlmann, leaves me to wonder if any of your correspondents have ever tried a Clincher Dreadnought. (Please do not imagine I am a commission agent for the makers of this tyre.) My experience with it proves that at least one make of tyre can claim suitability for its purpose. I have used the Clincher Studded Dreadnought on the rear wheel of my big four for approximately 3,000 miles, 1,300 of which were done with sidecar, including some fast work, and on several occasions with very heavy load. The tyre has been through to the last day of the Scottish Six Days' Trials, and with the sidecar from Birmingham to the Land's End and back, and whilst I cannot say that "it shows not the slightest cut

or sign of wear," which seems a favourite quotation in tyre testimonials, yet I must express my entire satisfaction with it. I have not had a moment's trouble with the cover. The tread is certainly worn smooth, but the fabric is in perfect condition—apparently as good as new. Not included in above mileage are many short runs with and without sidecar. Nevertheless I consider the cover with a new tread will be good for, at least, another 2,000 miles. Whilst complaints are so rife, I think a little appreciation not out of place.

JAS. L. NORTON.

Spring Forks.

[5899].—On the letter [No. 5875] signed "Engineer" appearing in last week's issue of your valuable paper, I see a question about the working of my new pattern spring fork, an illustration of which you published on the 31st ult. I am pleased in reply to "Engineer" to say that if the fork is made exactly as I have designed there is no danger of the front wheel fouling the top of the forks, and no risk of the lower mudguard touching the frame when the wheel is pushed backwards.

The wheel can move upwards, backwards, and forwards, and springs will absorb any kind of severe jar and engine vibration.

H. LANZEROTH.

Accident at the New Brighton Track. An Eye-witness's Impressions.

[5900].—Will you please allow me to say a few words in connection with the deplorable accident at the above track, as possibly I have had more experience of this track than anyone else? I wish particularly to take exception to your statement that the engine sizes ought to be limited after this accident, for what has the accident to do with engine capacity? At the time of the accident I do not consider Mr. Henshaw was doing more than 42 m.p.h., and as I hold the record for the track at 57 m.p.h. it is obvious the track is quite safe at that speed. Now we all know that nearly every lightweight is able to do well over 40 m.p.h., and only recently we have heard of several attaining 60 m.p.h. The true cause of the accident has nothing to do with the speed or power of the engine, but was due to Mr. Henshaw not confining his attention to the track.

I may say that New Brighton track is a slow one, as a single that will do over 60 m.p.h. on the straight will not touch more than 52 m.p.h. on the track.

E. F. BAXTER.

Sunday Competitions.

[5901].—On Sunday, the 3rd inst., whilst riding to Monmouth I suddenly ran into a hill-climb which was being held on the Crosshands Hill situate between Usk and Raglan. I need scarcely say I was very much astonished and disgusted. The hill in question is on one of the main roads of Monmouthshire, it is crossed at right angles at the point where the competitors would be going fastest by another much used road, and further the day was Sunday. Such conduct can only serve to bring our sport into disrepute, and if this climb was held under the auspices of any club (which I believe was the case) it ought to be severely censured.

COMMONSENSE.

Silence.

[5902].—I fail to see that your correspondent "Open Exhaustion" (albeit he rides a fast lightweight, and despite his assertion that he annoys no one) will further the gospel of the Anti-cut-out Mission by his lurid and somewhat hysterical tirade.

His parallel of an open exhaust and a prehistoric savage howling in the tree-tops is pretty, but the analogy is hardly convincing.

I have heard of engines which develop more power under an open exhaust, and I have even heard of motor cyclists closing their cut-outs in villages and towns and when passing horses; but as for the man who "whizzes like a gatling gun" under your correspondent's window (have you, sir, ever seen, or heard, a gatling gun "whizz"? it is a most impressive sight, or sound)—why he should necessarily be a "brainless bounder" or a "moral imbecile," I cannot quite follow. Nor can my stunted reasoning power grasp the reason why in order to ride an open exhaust one need wear "quaint attire," or carry a representation of a "wailing babe" or a trodden-on dog.

ARTHUR M. C. SCOTT.

A.C.U. Inter-club Championship.

SATURDAY'S A.C.U. inter-club championship proved a great deal more successful than last year's event, both in the matter of entries and organisation. This year there were teams of six representing nine different clubs, compared with last year's total of three clubs. The course was much more severe than the one selected in Derbyshire last September, being mostly over Warwickshire roads, and including four ascents of the famous Edge Hill, near Kington. To render the hill-climbing test still more severe marks were awarded for slow ascents, so that riders of change-speed geared machines were at a decided advantage.

After the course had been announced and the numbers and route cards distributed at the Red Lion Hotel, Banbury, a prompt start was made at 9 a.m. from the Cross at Banbury in fine weather, competitors representing different clubs being despatched in trios by Messrs. J. W. G. Brooker, H. Synyer, and H. P. Beasley.

Four circuits of a forty-two miles course had to be covered at a speed of twenty miles per hour, and the route was as follows: Drayton, Wroxton, descending Sunrising Hill, Pillerton Priors, Ettington, Stratford-on-Avon (20 miles), Tiddington, Wellesbourne, Kington, Edge Hill (slow test $3\frac{1}{4}$ miles), Wroxton, Drayton, and Banbury.

Performances on the Test Hill.

There was little of incident on the first circuit until Edge Hill was reached, and at once the process of thinning the ranks was commenced. The timekeepers were Messrs. F. Straight and A. G. Reynolds. Geo. Hill (Wolverhampton) punctured at the hill foot; A. H. Gutteridge (Herts County) and E. A. Gorton (Coventry) stopped on the 1 in 7 gradient owing to their belts slipping. H. J. Pooley (N.W. London) stopped on the first steep pitch, and was later seen being towed into Banbury behind a carrier's cart.

Quite a number of the passenger machines failed on the test hill. T. F. Cooke (Wolverhampton) found the gradient too steep for his Scott and side-car, and on the next three ascents shed his passenger near the hill foot and continued *solus*. This practice was also adopted by A. C. Seale (Chesterfield) with his Bradbury and N.S.U. gear. Alan Hill (Coventry) conked to a standstill near the summit, and again later in the day, but made two creditable ascents on his Rudge, which was the smallest engine on a passenger machine in the trial. Having mentioned the majority of the failures we may refer to one or two of the especially good performances on the hill, and before doing so may remind readers

that two years ago it was the exception rather than the rule for $3\frac{1}{2}$ h.p. machines to climb the hill with touring gears, yet nowadays riders may toy with the hill and take liberties with the engine undreamt of in those days.

The most impressive ascents were made by the Charley's Aunt of motor cycling—Sam Wright (Coventry), who has non-stopped in every reliability trial he has entered. His two-speed $3\frac{1}{2}$ Humber literally crawled all the way on the low gear with the throttle only a quarter open until it appeared almost difficult to balance the machine. His slowest official time was 4m. 32s. for the measured stretch of three-quarters of a mile, equal to 9.93 m.p.h. He was, in fact, so slow that he had to race to the turning point

The restart from Banbury Cross after the luncheon interval.

A.C.U. Inter-club Championship.—

THE STARTING POINT, WITH THE FAMOUS BANBURY CROSS
IN THE BACKGROUND.

On the right Mrs. Cooke is seen verifying Mr. Cooke's watch. On the left is C. S. Burney (Rudge), and in the centre P. Weatherill (3½ Zenith), all non-stop competitors.

where the timekeeper was stationed. R. W. Duke (Birmingham) created some amusement by chaffing Wright as they crawled up, and he was so anxious to reduce the pace of his Zenith to that of Wright's Humber geared 5 and 10 to 1, that he came to a standstill altogether. Another of the Birmingham team—H. D. Jones, the exhaust of whose engine blew direct on to the ground, raising clouds of dust—followed Duke's example. The ascents of R. H.

Viggers (Oxford), A. J. Stevens and P. J. Evans (Birmingham) were much admired by the crowd collected on the hill, which increased in proportions as time went on. F. W. Barnes and P. Weatherill (Streatham) manipulated their Gradua gears to advantage, Rice Pyle (Herts County) made four clean ascents, as also H. F. S. Morgan (Oxford). E. B. Ware (Streatham) was perhaps slowest of all on his three-speed Chater-Lea sidecar, for Harold Karslake walked alongside and chatted for part of the way up. Of the single-gear machines R. G. Mundy's Triumph geared 5½ to 1 pulled steadily but surely to the summit at a speed of approximately 15 m.p.h., G. Smith (Coventry) and S. T. Tessier (Streatham) being only a few seconds faster. Most of the riders of single-gear machines dared not take liberties with their engines for fear of failure, and got up as best they could; others tried to go too slowly and suffered the humiliating experience of conking to a standstill.

The Mid-day Interval.

At the end of the second circuit there was a stop of an hour for lunch, and many were the grumbles that no halt had been arranged on the morning's run of 84 miles (4¼ hours); indeed, this utter neglect on the part of the A.C.U. officials led to many disgraceful scenes upon which we need not dwell. There was much consternation when it became known that not a single complete team had accomplished non-stop runs even at the half distance.

The Monotony of the Trial.

Resuming in the afternoon, the course was taken in the same direction, but why, oh why, were not the riders despatched in the reverse way at half distance? As so much had been made of the secret course, we

SCENE NEAR THE SUMMIT OF EDGE HILL.

Dr. B. Fawcett (8 h.p. Chater Lea and Lowen sidecar), passing Alan Hill, who had stopped at this point, the gradient being 1 in 7.

A.C.U. Inter-club Championship.—

Two competitors arrive at Banbury together for lunch. L. Smith, Chesterfield (Bradbury), followed by A. Elson, Coventry (Triumph).

should have thought that this course would have immediately suggested itself to the organising body. It would have been greatly appreciated by the competitors, who were thoroughly bored by the monotony of travelling over the same roads four times during the day. Besides, the ascent of Sunrising would have been an interesting and instructive change, and would have helped considerably in the weeding out process.

Mechanical troubles were exceedingly few, the most serious being a burst cylinder head; punctures, of course, were very much in evidence. E. B. Ware had five, took nearly two hours to remove the back wheel and fit a new tube, and therefore retired. Dr. B. Fawsett, who made three very pretty ascents of Edge Hill on his 8 h.p. Chater-Lea and Lowen two-wheeled sidecar, was obliged to shed his passenger on the last run up, which increased the Birmingham riders' failures on the test hill to four. S. T. Tessier stopped with a sooted plug. Several riders ran off the course, one party (Cooke, Blumfield, and Tonks) finding themselves at the top of Edge Hill ninety minutes before they were due. It should, however, be mentioned that the route was excellently marked; further cards denoting intervals of five miles.

The Finish in Semi-darkness.

A goodly crowd had collected in Banbury to witness the finish, and by the time the tail-end of the procession arrived it was almost dark. Turning to the results, it must be confessed that the demonstration of reliability was disappointing. No team finished with a clean score—in fact, the winners—the Oxford M.C.C. team—suffered three involuntary stops, the Coventry and Warwickshire M.C. (second) four, and the Birmingham M.C.C. (third) six. Two teams could not even boast a non-stop run among them. In arriving at the results, marks were awarded for slow ascents of the hill, and deductions were made for every minute a competitor was early or late at the checking stations. The Oxford team, whose win, by the way, proved most popular, won on reliability. Their total marks for regular running and hill-climbing were not quite so good collec-

tively as the Coventry team, who were the holders of the cup. The new club champions had five amateurs in their team.

The individual performances of the first three teams are tabulated hereunder, and those riders who accomplished non-stop runs are marked accordingly.

WINNERS OF THE CUP AND GOLD MEDALS.

OXFORD M.C.C.

H. S. Askew ($3\frac{1}{2}$ h.p. Triumph), non-stop.
W. A. Matthews ($3\frac{1}{2}$ h.p. Triumph), non-stop.
H. G. Hill ($3\frac{1}{2}$ h.p. Bradbury), non-stop.
H. F. S. Morgan (8 h.p. Morgan Runabout), non-stop.
R. H. Viggers ($2\frac{3}{4}$ h.p. two-speed Enfield), one puncture.
Jas. E. Webb ($3\frac{1}{2}$ h.p. Triumph), two stops, test hill, and puncture.

SECOND.—SILVER MEDAL WINNERS.

COVENTRY AND WARWICKSHIRE M.C.

A. Elson ($3\frac{1}{2}$ h.p. Triumph), non-stop.
Sam Wright ($3\frac{1}{2}$ h.p. two-speed Humber), non-stop.
Geoffrey Smith ($3\frac{1}{2}$ h.p. Triumph), non-stop.
C. S. Burney ($3\frac{1}{2}$ h.p. six-speed Rudge), non-stop.
E. A. Gorton (7 h.p. Rex), two stops, test hill, and puncture.
Alan Hill ($3\frac{1}{2}$ h.p. Rudge and sidecar), two stops on test hill.

THIRD.—BRONZE MEDAL WINNERS.

BIRMINGHAM M.C.

A. J. Stevens ($2\frac{1}{2}$ h.p. two-speed A.J.S.), non-stop.
T. Pollock ($3\frac{1}{2}$ h.p. three-speed James), non-stop.
P. J. Evans ($3\frac{1}{2}$ h.p. two-speed Humber), non-stop.
R. W. Duke ($3\frac{1}{2}$ h.p. Zenith), two stops, test hill, and belt.
H. D. Jones ($3\frac{1}{2}$ h.p. Zenith), three stops, test hill, and puncture.
Dr. B. Fawsett (8 h.p. Chater-Lea and sidecar), one stop, test hill.

STREATHAM AND DISTRICT M.C.C.

F. W. Barnes ($3\frac{1}{2}$ h.p. Zenith), non-stop.
P. Weatherill ($3\frac{1}{2}$ h.p. Zenith), non-stop.
R. G. Mundy ($3\frac{1}{2}$ h.p. Triumph), non-stop.

HERTS COUNTY A.C.

E. C. Jarvis ($3\frac{1}{2}$ h.p. Triumph), non-stop.
R. Rice Pyle (8 h.p. Bat and sidecar), non-stop.
C. Cather Cooke ($3\frac{1}{2}$ h.p. Triumph), ran off route, otherwise non-stop.

NORTH-WEST LONDON M.C.C.

W. Cooper ($3\frac{1}{2}$ h.p. Bradbury), non-stop.

CHESTERFIELD AND DISTRICT M.C.C.

L. Smith ($3\frac{1}{2}$ h.p. Bradbury), non-stop.

H. F. S. Morgan, who was a member of the winning Oxford Team, making a neat ascent of Edge Hill on his 8 h.p. two-seater Morgan runabout.

SNAPPED FROM THE BACK OF THE OFFICIAL ROVER CAR.

A string of competitors leaving Banbury for the last lap (which may be obvious from the long shadows across the road). The sidecar in the distance is going to Banbury; competitors passed each other along this stretch of road after encircling the Banbury Cross. The foremost rider is S. T. Tessier, and behind him R. H. Viggers, J. A. Pell, P. J. Evans, and P. Weatherill.

IRISH END-TO-END: A LIGHTWEIGHT RECORD ESTABLISHED.

THE Irish End-to-end record has of late loomed largely in the eyes of Irish motorists, and within the past fortnight a couple of attempts have been made to put up new figures for the distance. Last week we briefly mentioned that James Stewart, one of the most successful Irish motor cyclists, and who, it will be remembered, recently won the End-to-end run for the Palmer Trophy, promoted by the M.C.U.I., essayed the task of establishing a time for lightweights. In his self-imposed task he selected a $2\frac{3}{4}$ h.p. Douglas, and the result showed the wisdom of his choice, for the machine went through the journey without the slightest trouble.

An Early Start.

Starting from Mizen Head at 5 a.m., the eighty-one miles to Cork were knocked off in 3h. 5m., being equal to an average of $26\frac{1}{2}$ m.p.h. This was certainly a good beginning, when the wretched state of the greater portion of the roads is taken into consideration. From Cork to Cashel (sixty miles) occupied 2h. 5m., or an average of $28\frac{3}{4}$ m.p.h. Fresh petrol was taken in at Cashel, and as a quantity of dust got into the tank the carburetter became choked at times. To add to this misfortune, punctures were encountered, and between Cashel and Dublin Stewart found it necessary to detach his back cover four times. Exactly one hour was lost from this cause, the ninety-seven miles to the metropolis monopolising 4h. 2m., which works out at an average of $22\frac{1}{2}$ m.p.h.

Carburetter Again Choked.

From Dublin to Banbridge (seventy-nine miles) another hour was lost through the carburetter again becoming choked with the dirty petrol. However, a slight improvement was made in the average, which showed $24\frac{1}{2}$ m.p.h. Fresh petrol was taken in at Banbridge, and the effect was soon apparent. Antrim, twenty-seven and a half miles distant, being reached in 2m. under the hour. From the latter place to Ballyvoy, Fair Head is exactly fifty miles, and it only took 1h. 25m. to roll off the half-century, which shows the highest average

for the day, viz., $35\frac{1}{2}$ m.p.h. The entire distance of 394 miles took 15h. 8m. to traverse—not 12h. 8m., as our wire stated last week—which gives an average of 26 m.p.h. When the lost time through punctures is taken into account, it must be admitted both rider and machine made a very meritorious performance. Stewart rode the entire journey unaccompanied by any friends, and this certainly enhances the merit of his performance.

THE PROPOSED TWO DAYS' RELIABILITY TRIAL IN THE NORTH.

The course selected for the second day's run. The Liverpool A.C.C. has applied to the A.C.U. to hold this event on October 7th and 8th, so far without success.

Climbing Edge Hills on a 3½ h.p. Sidecar.

THE famous Midland acclivities known as Edge Hills are always considered good tests for a single-geared solo machine, and with a sidecar attached to a standard single-cylinder mount a change speed is usually required to enable the hills known respectively as Sunrising and Edge Hill to be successfully negotiated. We believe it is possible to climb both hills with a standard 3½ h.p. mount with sidecar, geared low, but a more certain ascent can be made with a variable gear. It was, therefore, with considerable pleasure that we accepted B. Alan Hill's invitation one day last week to accompany him in his Rudge sidecar machine fitted with the N.S.U. two-speed gear. Hill was one of the C. and W.M.C. team which took part in the A.C.U. championship trial last Saturday, and it was with a view of ascertaining if the combination would ascend these hills that the trials were made which we were asked to observe.

Sunrising Climbed at 25 m.p.h.

We left Stratford-on-Avon by the Banbury Road, and kept the machine running all the way to the foot of Sunrising at an average speed of twenty miles an hour, and took the hill with a hot engine, the combined weight of passengers being eighteen and a half stones; the Rudge combination went up without a falter and never dropped below twenty-five miles an hour by the Jones speedometer. A second ascent of the same hill was, if anything, faster, as the engine had an opportunity to cool during the descent.

Continuing along the ridge past the round tower the more severe acclivity of Edge Hill from Kineton was attacked. The ascent of this was equally successful, and the combined weight not being enough to satisfy Mr. Hill's ambitions, it was raised by a change of passengers to twenty-three stones. Soon after the start, the speedometer needle showed 30 m.p.h. on top gear, and so continued till just below the bad corner on the hump of the hill; on changing down and quickly accelerating, the needle went to 25 m.p.h., where it remained till near the summit, when it went back to 23, 20, and 21 m.p.h.

EXCURSION TO OLYMPIA.

An excursion to London for the Olympia Cycle and Motor Show is being arranged by the Birmingham centre of the Cycle and Motor Trades' Benevolent Fund for Saturday, November 25th.

THE OFFICIAL OCTOBER QUARTERLY TRIALS COURSE.

The last A.C.U. Quarterly Trial of the 1911 series starts from Birmingham at 9 a.m. on Saturday, October 14th, when the course, measuring 150 miles, shown in the above map will be followed.

The gear ratio on low speed was 6½ to 1, which gives a high gear ratio of about 4½ to 1. Strangely enough the same clever sidecar demonstrator had two stops in the before mentioned trial last Saturday. It is the old story again. When a machine is especially required to give of its best, it develops a fit of the sulks.

It will be of interest to Rudge riders to know that a thirty-eight jet was fitted to the B. and B. carburetter, and the extra air port enlarged. The petrol level was also adjusted higher than usual.

A HILL-CLIMBING CONTEST IN BAVARIA.

Basil V. Jones competing in a hill-climb at Schesslitz, near Bamberg, in which nineteen riders took part. Riding a Premier, Jones was first on formula, and made the second fastest time.

M.C.C. RUN TO WORTHING.

A run had been arranged by the M.C.C. to Clacton at the week-end, but at the request of a number of members the destination has been made Worthing instead.

BRISTOL CLUB'S TRIAL.

A trial was held last Saturday over the course, Keynsham, Saltford, Globe Inn, Marksbury, High Littleton, Pensford, and back to Keynsham, distance twenty-three miles, the circuit to be covered three times, no watches or speedometers allowed, and a non-stop run had to be made. About twenty-eight entries were received, and the winners were: 1, G. L. Fletcher (2½ h.p. Douglas), only 4m. 34s. error; 2, A. B. Canks (2½ h.p. Douglas), 6m. 15s.; 3, E. J. Prosser (5 h.p. Rex Sidette), 7m. 2s.

FORMULA RESULTS OF TORBAY HILL-CLIMB.

The formula results in the Torbay and District M.C.C. hill-climb in South Devon are given hereunder: The results on time were given on page 963 of our last issue:

Class 1. Open Lightweight Event.—1. A. Powell (2½ h.p. Enfield); 2. W. W. Douglas (2½ h.p. Douglas); 3. H. Benny (2½ h.p. Enfield).

Class 2. Touring Machines.—1. Rupert May (3½ h.p. Triumph); 2. J. Woodhouse (3½ h.p. Comet-Precision); 3. F. T. Wilson (3½ h.p. Rudge).

Class 3. Club Event for Lightweights.—1. A. Powell (2½ h.p. Enfield); 2. H. Benny (2½ h.p. Enfield); 3. — Edwards (1½ h.p. Motosacoche).

Class 4. 500 c.c. Touring Singles.—1. R. May (3½ h.p. Triumph); 2. J. Woodhouse (3½ h.p. Comet Precision); 3. F. T. Wilson (3½ h.p. Rudge).

Class 7. Club Event (Unlimited).—1. A. Powell (2½ h.p. Enfield); 2. R. V. W. Jamson (4 h.p. Norton); 3. R. Broadbear (3½ h.p. Premier).

FORMULÆ FOR HILL-CLIMBS.
IN WALES AND THE WEST.
A.C.U. CLUB CHAMPIONSHIP.
BRAKES AND STOPPING POWER.

An Overseas Issue

of *The Motor Cycle* will be published on Thursday, October 12th. Special articles of interest to motor cyclists in far-away countries will be included, together with a selection of colonial motor cyclists' experiences. The usual features will, of course, be retained.

Track Race at the Festival of Empire.

On the 30th inst., at the Crystal Palace Track, the Marlborough Athletic Club will hold a five miles open handicap for prizes value £5, £2, and £1.

An Old Motor Cyclist's Appointment.

W. A. Sale, whose name will be better known to motor cyclists of 1906-7, has, we understand, sold his Luton business, and is about to take up his new duties as manager to W. H. Wells, of the Hendee Mfg. Co.

An Invitation.

Ever to the front with new ideas, Messrs. Brown Bros., Ltd., forwarded to us by the first U.K. aerial post, an invitation to view their new warehouses in Great Eastern Street, E.C., an invitation which is extended to all our readers.

Bristol Club's Blunder.

A special meeting of the Bristol B. and M.C. was held on Tuesday last week to go into the results of the Bristol-Oxford trial held on July 8th last, in which several serious errors had been made in the awards. The correct results now are: 1, W. W. Douglas; 2, Eli Clarke; 3, G. L. Fletcher—all riding 2½ h.p. Douglas machines.

Liverpool A.C.C. at Loggerheads with the A.C.U.

The pending 200 miles reliability trial organised by the Liverpool A.C.C. has generated a bit of trouble unexpectedly. Being the first and only open competition arranged about Merseyside, Mr. Secretary Barton determined to make it a big success, and soon found that he was on the way to achieving that end. The A.C.U., however, has objected to an "open" competition on the allegation that it will clash with its own affairs. In Liverpool the attitude is regarded as rather dog-in-the-manger, for it is argued that the A.C.U. will neither arrange contests about Liverpool and North Wales, nor, according to present circumstances, will it encourage the Liverpool club to hold one.

The New Brighton Team Race.

Referring to the track race at New Brighton between teams purporting to represent the Birmingham and Liverpool clubs, and in which a serious accident occurred, the hon. sec. of the first named body asks us to make it known that no race between his club and any other club has been arranged or held at any time, and the Birmingham M.C.C. committee are very indignant that their club's name was mentioned in the advertisements and announcements before the event.

3,000 without an Engine Adjustment.

D. R. O'Donovan, whose attempt to cover 3,000 miles without using a tool on the engine we referred to last week, is going in promising style. Writing us from Kempston, Beds, last Monday, he mentioned that his mileage now totals 1,000, and all the seals affixed by *The Motor Cycle* are intact. His 3½ h.p.

clutch Singer is, he adds, running splendidly, and should good luck attend him, he proposes having the machine timed for a flying mile after covering 1,500 miles, and again at the conclusion of the trial. The method of sealing the engine was as follows: The valve caps are sealed to the cylinder, the cylinder to the frame, crank case to the frame, and rear wheel spindle to the frame.

Speed Limit Abolished in the Isle of Man.

On September 5th an Act of Tynwald was promulgated, abrogating the speed limit in the Isle of Man, which up till then was fourteen miles an hour, and relying for the protection of the public on a section similar to Section 1 of the Motor Car Act, passed by the House of Commons in 1903, penalising reckless driving. The Manx A.C. is to be congratulated on the success of its efforts to have the speed of motor cars placed on a sound basis.

**A.C.U. INTER-CLUB CHAMPIONSHIP.**

Edge Hill was the scene of many failures. Our illustration shows two passenger machines, and another solo rider in the distance, all of whom stopped on Edge Hill, but the single-gear Rudge rider in the centre took no risks and ignored the slow test. Perhaps he imagined that, wearing a racing skull cap, it would be *infra dig.* to ascend the hill at anything but speed.

A Twice-stolen Mount.

For the second time a Douglas machine belonging to Mr. W. O. Oldman, of 77, Brixton Hill, S.W., has been stolen. It was taken from the Stadium, Shepherd's Bush, after the North-west London M.C.C. gymkhana, but the police have again been successful in their efforts to regain possession. On the occasion of its first disappearance the police adopted a novel and clever method of entrapping the thief. It transpired at the police court that a detective inserted an advertisement in the miscellaneous columns of *The Motor Cycle* as follows: "Wanted, a Douglas lightweight," and the unsuspecting thief answered the advertisement and was promptly arrested.

The Next B.M.C.R.C. Meeting.

At the Brooklands Automobile Racing Club meeting on Wednesday, October 4th, there are six events for cars and one for motor cycles. The latter is termed the fifth long motor cycle race, which is a handicap for all classes of motor cycles over a distance of about eight and a half miles. Entries close next Saturday at noon.

M.C.C. Hill-climb at Sundon

We have examined the times at the above contest held on the 8th inst., and notice that A. J. Moorhouse's time of 47 secs. on the 7 h.p. Indian in the open class was equalled by F. W. Barnes on his touring 6 h.p. Zenith-Gradna in Class 3. The fastest single-cylinder machine was the 3½ h.p. L.M.C. ridden by J. H. Slaughter, A. L. Ommaney (3½ h.p. Rudge) being but one-fifth of a second slower.

The Coveted Single-cylinder Hour Record.

After J. R. Haswell had captured the 500 c.c. hour record on his Triumph, we ventured the opinion that it would not be allowed to stand for long without molestation. O. C. Godfrey has already had several tries to wrest the honour from the Warwickshire amateur on the single cylinder Indian—the Plough—which he used at the last B.M.C.R.C. meeting. On one of these attempts, so we are informed, A. J. Moorhouse was present, and after the signal to start had been given, Moorhouse mounted his 7 h.p. twin Indian and overtaking Godfrey commenced to act as his pacemaker. The timekeeper, Mr. A. V. Ebbelwhite, promptly objected to this practice, and the attempt was stopped.

A Military Ride.

For the purpose of proving to the Canadian military authorities the value of motor cycles in time of war, Percy A. McBride, a well-known Toronto rider and Captain McCarthy, of the 34th Regiment, Ontario Command, recently rode from Toronto to Ottawa, the capital city of the Dominion, a distance of 325 miles, over many kinds of roads, in fourteen hours. Four h.p. single-cylinder Excelsiors (American machines) were used and outside of tyre troubles the pair encountered no trouble en route. Each was the bearer of an official message, McBride carrying a dispatch from Mayor Geary, of Toronto, to Mayor Hopewell, of Ottawa, while Captain McCarthy took a message from Colonel Henning to the Militia headquarters.

A New Lightweight Record.

On Monday, the 11th inst., Harold Cox, mounted on a lightweight twin-cylinder Forward motor bicycle, succeeded in lowering the two hours and 100 miles records for this type of machine. The scene of his triumph was Brooklands, and the weather on the occasion of his ride was dull, while a slight wind was blowing. The machine was fitted with Dunlop tyres, Lyso belt, Bosch magneto, and C.A.P. carburetter. Price's oil and Shell motor spirit were used. The time

FUTURE EVENTS

Sept. 23.—B.M.C.R.C. Race Meeting at Brooklands.

" 30.—Streatham and District M.C.C. Open Hill Climb

Oct. 12.—"The Motor Cycle" Overseas Number.

" 14.—A.C.U. Quarterly Trial (Midland Centre) fourth and last of 1911 series.

Nov. 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

for the 100 miles was 2h. 5m. 37½s. (47.76 m.p.h.), while in the two hours 95 miles 1,230 yards were covered (47.84 m.p.h.), constituting a Class B record. The previous best performance was by C. S. Franklin, on a Hazel-Jap, 70 × 76, on July 22nd, 1911, who covered 78 miles 132 yards in the two hours. The timekeeper was Mr. A. V. Ebbelwhite.

Motor Cyclist's Claim against Horsebreaker.

The collision case in which W. Pratt was involved on the occasion of his P. and M. toolbagless trial comes up for hearing at Gloucester to-morrow (Friday).

Martin Attempts Record.

Harry Martin, on a new 500 c.c. class twin Martin-Jap, 75 × 55, 498 c.c., made an attempt on the hour record on Friday, the 15th inst. The wind, however, blew so strongly from the north-west that he was unable to travel sufficiently fast.

Saturday's Brooklands Meeting.

Next Saturday's B.M.C.R.C. meeting will most likely prove the most interesting of the year, as quite a number of the leading riders will participate. In the hundred miles race, C. R. Collier will ride a new machine fitted with a single-cylinder 3½ h.p. Matchless engine, having the dimensions 90 × 77.5 = 495 c.c. Collier will endeavour to improve upon J. R. Haswell's mileage for the hour.

Sam Wright will also bestride a stripped T.T. twin Humber, on which he is confident of beating previous best. A couple of Alcyons will also show their paces on the track.

The Next Quarterly Trial.

The last A.C.U. Quarterly Trial of the 1911 series will be held on Saturday, October 14th. Several routes in the Midlands are under consideration. The course will be one of about 150 miles in length, and will extend over a route from near Birmingham via Hagley, Kidderminster, Bewdley, Farlow Bank (test hill), Ludlow, Tenbury, Bromyard, Martley, Worcester, Tewkesbury, Gloucester, Birdlip (test hill), Cheltenham, Winchcombe, Evesham, Bromsgrove to Birmingham. This contest should prove the most interesting and instructive of the series, seeing that it starts from the motor cycle manufacturing district, and will decide the winner of the aggregate cup in the four Quarterly Trials of 1911. The two timed test hills, Farlow Bank and Birdlip, are gradients which should adequately test the competing machines especially if the roads are wet and heavy.

A QUADCAR SEEN AT SHANKLIN, I.O.W.

The runabout illustrated was snapped at this hilly seaside resort. It is belt driven and has an 8 h.p. Aster engine. The petrol consumption, we are told, is 60 to 70 miles to the gallon.

A NOVEL MOTOR CYCLE FRAME.

LAST week we were permitted to inspect a $2\frac{1}{2}$ h.p. motor bicycle which has just emerged successfully from a thousand miles test on the road. Its chief novelty is the built-up frame, the invention of Mr. F. T. Robb, but the mount was assembled by the Roulette Cycle Co., of Gosford Street, Coventry, who are in a position to grant royalties

are duplicated, and that, instead of being brazed, they are bolted together. This plan, if it can be carried out without the joints becoming loose (and the machine has run 1,000 miles or so without this happening), has the very obvious advantage over the usual method that any tube can easily be replaced in a few minutes if damaged by an accident without taking the whole machine down for re-brazing, which also necessitates re-enamelling, and is a matter of several days.

Light Weight Considering Horse-power.

All tubes are 20 gauge, and the weight of the machine, with a $2\frac{1}{2}$ h.p. J.A.P. engine as illustrated, comes out at the surprisingly low figure of 122 lbs., in spite of the increased number of tubes. An interesting feature of this construction is that it renders the use of special tank fastenings—always a possible source of trouble—quite unnecessary. The tank is clipped tightly between the twin top tubes and needs no other fastening. It can be taken out if necessary by the removal of one of the horizontal top tubes in the space of five minutes. The cantilever saddle spring is very neat and effective, the saddle pillar being hinged where it joins the frame. Its action will be easily seen from the sketch. The engine is held very rigidly by no less than four bolts, which rigid system of suspension is considered by many to add considerably to the efficiency of the engine.

We are given to understand that the option of using the frame on 1912 models is under the consideration of one or two leading manufacturers. It may be possible for our readers to inspect the machine at the Olympia Show, as should the negotiations at present proceeding fall through, the Roulette Cycle Co. anticipate exhibiting the machine direct at that exhibition. It is further not improbable that the design will be standardised.

BRITISH IMPORTS AND EXPORTS.

The value of the imports for the month ended August 31st for the last three years was—

1909.	1910.	1911.
Motor cycles— £2,689	£4,398	£2,597
Parts thereof— £2,852	£6,013	£4,875
£5,541	£10,411	£7,472

Below will be found figures showing the exports for the same month in each year, and the rapid increase cannot fail to be noted :

1909.	1910.	1911.
Motor cycles— £6,315	£11,317	£19,497
Parts thereof— £2,739	£4,766	£5,990
£9,054	£16,083	£25,487

The following table gives the imports and exports for the eight months ended August 31st :

IMPORTS.		
1909.	1910.	1911.
Motor cycles— £29,891	£35,462	£34,096
Parts thereof— £2,852	£6,013	£4,875
£32,743	£41,475	£38,971
EXPORTS.		
1909.	1910.	1911.
Motor cycles— £30,517	£64,978	£139,786
Parts thereof— £21,637	£26,130	£41,632
£52,154	£91,108	£181,418

The enormous increase in the exports, amounting to almost double in the case of motor cycles and parts, must be very gratifying to the British manufacturer, as well as most deserved.

The power plant of the Roulette, also showing double tube frame and spring seat pillar. The tank is supported entirely by the frame tubes.

for the use of the frame. The machine illustrated was built for experimental purposes, and is somewhat shorter than

The cantilever spring seat pillar.

is proposed for the final design. The chief point of divergence from standard practice is that all tubes, usually single,

Showing the double D section top tubes gripping the tank.

The Roulette-Jap motor bicycle, which, as will be seen, has a novel type of frame

CLUB NEWS.

Manchester M.C. last hill-climb of the year. Harry Reed (3½ h.p. Dot) who was third, and W. T. Munroe (3 h.p. Triumph) on the starting line.

Western District M.C.

Members and friends are reminded of the run on the 24th inst. to the Clarendon Hotel, St. Albans. Return will be made by way of Sarratt in the afternoon.

Ipswich and District M.C.C.

We are informed that a club bearing the above title will shortly be formed in Ipswich. A meeting will be held on September 30th, at the Co-operative Hall, Carr Street, Ipswich, when the president and officers will be elected.

The Motor Cycling Club.

The above club will hold a speed-judging trial on Saturday, the 30th inst., for which a large entry is expected, this being the last competition of the year. Entries close next Monday. The trials hon. sec. is Mr. Robert H. Head, 7, Upper Baker Street, N.W.

Walthamstow M.C.

The final for the W. S. Low Cup was run over a course from Newmarket to Bishop Stortford last week. Competitors were timed at a secret milestone, and the one riding nearest to a 20 m.p.h. schedule was declared holder of the cup for the ensuing twelve months. The results are as follows: 1, F. A. Applebee (3½ h.p. Scott and sidecar), error from schedule time 2s., silver cup and gold medal; 2, M. Raven (3½ h.p. Rudge), 5s., gold medal; 3, J. W. Percival (6 h.p. Fafnir tricar), 5½s., gold medal; 4, J. T. Browett (8 h.p. Minerva), 20½s., gold medal.

Manchester M.C.

This club held its last hill-climbing competition of the year on Saturday, the 16th inst., at Heyden Bridge, for motor cycles and sidecars, there being the large number of entries of nineteen singles, three twins, and four sidecars. The competition (for this club) was run on original lines, known as the knock-out, the riders being handicapped on weight, horse-power, and previous performances. The riders were despatched in pairs, the first to finish drawing for the second round, until the last round, when the first, second, and third were decided. The course was a mile in length, and the riders could be seen from start to finish. W. Heaton (2½ h.p. A.J.S.) was unfortunately too light, and had to carry a bag of stones 19 lbs. weight on his back, which interfered with his mounting and riding. H. Scales, H. Reed, P. Butler, R. Birkett, and H. Andrews all made excellent times. Results:

SINGLES.—1, R. Birkett (3½ h.p. Triumph), 14s. start; 2, H. J. Scales (3½ h.p. J.A.P.), 8s.; 3, H. Reed (3½ h.p. Dot), 7s.; 4, J. L. Timperley (3½ h.p. Lib), 2s.

TWINS.—1, P. Butler (5 h.p. Dot), 10s. start; 2, J. A. Bottoms (2½ h.p. Enfield), 23s.

SIDECARS.—1, P. Platt (3½ h.p. Bradbury), scratch; 2, W. Houghton (3½ h.p. Bradbury), 10s. start.

Derby and District M.C.C.

On Saturday last the final event of the year was run off, which took the form of speed trials at Hulland Ward. The entries were somewhat limited, but the competitors and spectators made up in enthusiasm for lack of numbers. The winner was J. W. Cox (3½ h.p. T.T. Triumph), second D. C. Bolton (1 h.p. Bolton-Jap). Bolton's mount, which he has just had built up, is fitted with a special J.A.P. engine 60 mm. bore by 53 mm. stroke, capacity 150 c.c. The machine exhibited a surprising turn of speed, and on the handicap of three-quarters of a yard per c.c. capacity ran into the final, being then beaten by Cox's Triumph.

The quarterly general meeting will be held at headquarters on the 27th inst. at 8 p.m.

Lewes M.C.C. and Tunbridge Wells and District M.C.C.

A combined hill-climb was successfully held by the above clubs on Wednesday, September 13th. An ideal hill was found near Mayfield, which is about midway between Lewes and Tunbridge Wells. Over thirty entries were received for the six classes, which were arranged as follows: 1, standard touring twins; 2, standard lightweights; 3, standard touring singles; 4, flexibility; 5, T.T. machines; 6, any machine made during 1908 or earlier.

Prizes were kindly offered by the following firms: The Continental Tyre Co., Messrs. Dunhills, the Bosch Magneto Co., Messrs. Garners (exhaust whistle), Messrs. Wakefield (oil).

The winners were: 1, J. S. Richardson (5 h.p. Indian); 2, A. E. Sutton (2½ h.p. Douglas); 3, A. L. Russell (3½ h.p. Rover); 4, J. S. Richardson (5 h.p. Indian); 5, J. S. Richardson (5 h.p. Indian); 6, W. E. Gillot (4 h.p. Bat).

LEWES M.C.C. AND TUNBRIDGE WELLS AND DISTRICT M.C.C. INTER-CLUB HILL-CLIMB.

The meeting place.

Competing machines at the foot of the hill near Mayfield.

Club News.—

North Staffordshire M.C.C.

The competition for the president's trophy took place on 10th inst. Result: 1, C. E. Fowke ($3\frac{1}{2}$ T.T. Triumph); 2, T. F. Rodgers ($3\frac{1}{2}$ Rudge).

Mrs. J. Harvey, of Bournemouth, who is believed to be the first local lady motor cyclist, with her 2 h.p. single-cylinder lightweight Humber.

Essex M.C.

Mr. G. C. Sweet, assistant hon. sec. of the Essex Motor Club, is shortly leaving for Calcutta to take up a lucrative appointment. The best wishes of his clubmates and friends will go with him, as he is a popular member.

Newport (Mon.) and District M.C.C.

Entries for the hill-climb for machines up to 500 c.c. to be held during the first few days of October must be sent to the captain (Mr. J. Foreman) on or before September 21st. Members are kindly asked to comply with this request as it greatly facilitates handicapping.

North Middlesex M.C.C.

A breakfast run will be held to Westcliff on the 24th inst., leaving the Gatehouse, Highgate, at 6 a.m. A somewhat long route will be taken to evade the bad roads. Will all those taking part kindly communicate with W. S. Bennett, 23, Aberdeen Road, Highbury, who is making the necessary arrangements?

Woolwich, Plumstead, and District M.C.

Messrs. H. Collier and Sons, Ltd., having offered a set of prizes for a hill-climb, it was arranged and took place recently at Westerham under most favourable conditions. It proved a most sporting event, each competitor having an equal chance notwithstanding great variations in power, etc. Competitors were despatched up the hill singly at intervals of two minutes and timed very carefully, the handicap being arranged in accordance with each performance. Ten seconds improvement in time disqualified. Fastest time in this trial ascent was made by T. A. Carter ($3\frac{1}{2}$ Matchless). The difference between his time and others is shown against each. H. Cork (4 Matchless), 1s.; C. R. Collier (6 Matchless), 3s.; H. A. Collier (5 Matchless), 3 $\frac{1}{2}$ s.; H. Hill ($3\frac{1}{2}$ Rudge), 14s.; F. J. Ellis ($3\frac{1}{2}$ Matchless), 18 $\frac{1}{2}$ s.; H. Peterson ($3\frac{1}{2}$ Matchless), 21s.; J. Galley (5 M.O.B.M.), 37 $\frac{1}{2}$ s.; S. Lloyd (5 Matchless and sidecar), 58s.; S. C. Davis (2 $\frac{1}{2}$ Kerry), 66s.

Riders were then paired off as nearly as possible and despatched in pairs, the winners of this round to ride in the final. C. R. Collier having qualified for the final, decided to stand down. The result was: 1, S. C. Davis; 2, H. A. Collier; 3, H. Hill.

The fastest timed ascent was made by H. Cork. The club wishes to thank Messrs. Dowd, Walker, and others for their assistance, to which the success of the competition is largely due.

Birmingham M.C.C.

On Saturday next, the third annual "all equal" hill-climb will be held.

New members may join the club now by paying a combined subscription and entry fee of £1 1s., which will carry them up to December 31st, 1912. There will be several winter events, including smoking concerts, etc. Full particulars from Mr. Vernon C. Brook, hon. sec., "Oakdene," Cambridge Road, King's Road, Birmingham.

Sheffield and Hallamshire M.C.C.

The result of the above club's reliability trial to Pickering and back, including the ascent of Sutton Bank, is as follows: 1, F. H. Dunston ($3\frac{1}{2}$ Rudge), lost 1 $\frac{1}{2}$ marks; 2, Daniel Bradbury ($3\frac{1}{2}$ Norton), 2 $\frac{1}{2}$; 3, J. Haslam (6 Zenith), 4; 4, S. Sawyer ($3\frac{1}{2}$ Premier), 5 $\frac{1}{2}$. The following qualified for bronze medals: T. Durant, J. Arden, C. E. Squire, N. Newton, Chas. Nicholls, J. A. Stacey, H. Fawley, and F. Dover.

Huddersfield and District A.C.

The results of the reliability trial to Louth and back on the 9th inst. were: 1, *W. A. Lockwood ($3\frac{1}{2}$ h.p. James), cup and gold medal; 2, A. Graham (4 h.p. Roc), second prize; 3, T. Canley ($3\frac{1}{2}$ h.p. P. and M.); 4, G. Tolson ($3\frac{1}{2}$ h.p. P. and M.), novice prize. *This is the second year in succession that this rider has won the cup and gold medal.

The roads were in a very loose condition, and tyre troubles frequent. There were eleven starters, only one of whom failed to complete the whole course.

Lincolnshire A.C. (Motor Cycle Section).

The above club will hold a petrol consumption trial on Saturday, September 23rd, starting at three from South Park, Lincoln, and proceeding *via* Blankney and Ruskington to Sleaford, and returning by the top road to Lincoln—in all about thirty-five and a half miles. All tanks will be emptied at the start, and half a gallon of petrol served out to each competitor. The course completed, the amount of petrol remaining in tanks will be ascertained, and the results calculated on A.C.U. formula.

The Wheelers challenge vase will be awarded for the best performance, and a second prize will be given provided there are ten starters.

N.W. London M.C.C.

A speed-judging competition has been arranged for Saturday next, starting at 3.30 p.m. prompt from the Duke of York Hotel, Great North Road. The entry fee is 2s. 6d., and watches and speedometers are barred.

J. W. Woodhouse and the $3\frac{1}{2}$ h.p. Comet-Precision on which he has recently shone conspicuously in open hill-climbing competitions.

OCCASIONAL COMMENTS

By "IXION"

The A.C.U. and Private Owners.

I am in a position to state that if any trade men figured as "private owners" in the Six Days' Trial, the onus rests with the manufacturers and not with the A.C.U. The secretary made confidential enquiries about every entrant who described himself as a private owner, and no such entry was accepted unless the enquiries confirmed his amateur status.

Businesslike Methods.

"Only a Medico" (letter No. 5856) must not think that only obscure owners suffer from the unbusinesslike methods of certain firms. I suppose I am pretty well known to most of the concerns in the industry, and here is an account of my latest experience with one of the biggest tyre companies on earth. On July 4th I sent them two inner tubes, the valves of which needed reseating, and I mentioned that my racing machine was *hors de combat* until these tubes were returned. For several weeks I heard nothing, but at last a couple of angry letters extorted a *pro forma* invoice for 4s. 6d., which was settled per return. August 25th found me still impatiently awaiting my tubes, and another frantic letter elicited a parcel. When I tore this parcel open I found it contained two of the weirdest and holiest tubes I had ever seen, neither of which bore the slightest resemblance to my own tubes, and both of which stood in urgent need of extensive repairs; one contained an unremended gash some inches in length, and was disfigured by a dozen patches crudely applied by some frightful duffer, most of them curling off, lifting, and leaking; the other was disqualified by a torn-out butt, and disfigured by about a bucketful of solution, smeared on by somebody in a misguided effort to convert it into an endless tube. My vituperative remonstrances procured a most polite letter from the manager, promising me two new tubes. This was a fortnight ago, but the new tubes are not yet to hand.

Silent Gears.

A good many readers wonder why certain leading firms are so slow in standardising variable gears, of which the patents have long since been granted. Hundreds of customers are clamouring for the gear; its design and principle are obviously clever and sound, and yet the gear is not marketed. The best firms in the industry are notoriously scrupulous in not marketing a device until it is absolutely right, and a little patience is desirable. A common defect of new gears is want of silence. After the perfect noiselessness of the direct belt drive, the faintest whirr or hum from the transmission is undesirable, and it is astonishing how insistent the faint noise of a shaft running free on ball bearings may become. Variable gears are coming along all right, and before long everybody will be satisfied; in the meantime we can only applaud a

policy which aims at sheer perfection. I am glad to see the trade realises at last that the counter-shaft gear, with a chain for its fore-drive and a whopping pulley on the gear box, can practically eliminate belt trouble; I believe the combined chain-cum-belt drive is going to reduce our belt bills and our belt troubles past imagining.

The weakest point of a rubber belt is its fastener. The fastener itself may be unbreakable. Newsome, the Triumph rider, said the other week that he had not broken a belt-fastener for two years, and if he uses the make I chiefly affect I can easily believe him; but an unbreakable fastener only transfers the trouble to the belt, which will sooner or later "pull through," if the fastener stands up indefinitely. Now I have some experience of the behaviour of belts used as the secondary or rear portion of a combined chain-cum-belt drive, as when the engine drives by chain to a counter-shaft gear box, whereon a huge belt-pulley is mounted; it is very, very rare for such a belt to give any trouble at all, when once the preliminary stretch has been taken out of it. What a pity we cannot eliminate the fastener altogether and be able to buy endless belts woven to a given length. Of course, it would mean taking out the rear wheel and dismounting the brake rod to fit them, and in some cases springing out the rear stays—the keen rider does not mind a little trouble—but what a boon they would prove! It would, of course, be necessary to fit an adjustment to the rear wheel spindle.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Oil on Commutator.

(1.) I should be glad if you could tell me why my $3\frac{1}{2}$ h.p. 1908 Minerva runs slower with exhaust valve raised than with it dropped when magneto is switched off. (2.) I am also troubled with oil getting on commutator of Eise-mann magneto (eccentric driven), causing engine to misfire and finally stop. When the high-tension terminal carbon brush is removed, however, it seems quite clean. After inserting a rag and rotating magneto a few times it will fire all right. Do you think a new carbon is needed or does the rag get in and clean oil off armature? Is there a fibre ring in this type of magneto (high-tension)? (3.) Would a Millford Herald sidecar and Mabon free-engine clutch suit this machine for fairly level road?—F.G.

(1.) We cannot understand why the machine should run less freely with the exhaust valve raised than when it is dropped, though of course when the speed has passed a certain point the compression acts merely as a cushion and does not appreciably retard the engine. It seems also that the compression is very low in your engine. (2.) The trouble is probably due to a worn bush, and the oil leaking through the transmission gear case. The only remedy is a new bush, or the fitting of a felt washer over the point where the leakage occurs so as to collect the oil. No, there is no fibre ring in this type of magneto, the make and break being produced by means of a cam. (3.) The sidecar and clutch in question should suit your machine admirably, but a change-speed gear would be desirable.

Bexhill to St. Ives.

I am riding from Bexhill to St. Ives, Cornwall, and would be much obliged if you would kindly suggest the best route, and a couple of places where I can spend the night, as I propose being three days on the road. If the surface is good, I should like to visit Stone-henge and cross Dartmoor.—S.C.D.

From Bexhill your best route would be as follows: Lewes, Botney, Horsham, Guildford, Farnham, Basingstoke, White-urch, Andover, Amesbury, Salisbury, Hindon, Wincanton, Langport, Taunton, Wellington, Cullompton, Exeter, Okehampton, Launceston, Bodmin, Redruth, St. Ives. A detour might be made at Amesbury for Stonehenge, which is well worth examining, and the first night's stop

could very well be made at Amesbury, as this is a small, inexpensive, but entirely comfortable town, the roads in the neighbourhood being excellent. On the second day it would probably be wise to stop at one of the small hotels in Exeter, of which there are a good number, and in particular on the further side of the bridge going out of the town there are one or two on the left-hand side of the road which offer every comfort and are quite inexpensive. The roads over Dartmoor are very hilly and rough. If desired, and prettier scenery was the object of the run, it would probably be better to go through Barnstaple and follow the coast down to St. Ives, but you will find excellent roads and not a great number of hills on the route given. Care should be exercised in Redruth, as there is a steep hill down into the town, but if you are careful the police make no objection to a fair speed.

Harrow to North Wales.

I shall feel much obliged if you can furnish me with the best route from here (Harrow) to Llan-dudno via Worcester. I am shortly taking my holidays, and want to run down there on my $3\frac{1}{2}$ h.p. Triumph. Any information you can give me with regard to condition of roads, gradients, etc., will be most acceptable. Also if there is a better route without touching Worcester? I shall be glad if you will kindly give details of same.—R.J.H.H.

Your route through Worcester would be via Watford, Beaconsfield, High Wycombe, Oxford, Chipping Norton, Moreton-in-the-Marsh, Evesham, Worcester, Kidderminster, Bridgnorth, Shrewsbury, Oswestry, Llangollen, Corwen, Llanrwst, Conway, and Llandudno. Take care to drive carefully in the neighbourhood of Llandudno. If you desire

THE MANY USES OF THE MOTOR CYCLE.

The above reproduction is from a photograph sent by Mr. Walter Scott of Surbiton, showing one of the many services into which a motor cycle may be pressed, viz., conveying "small guests" to a wedding. The photograph was taken as Mr. Scott was starting with Mrs. Scott for their old nurse's wedding at Esher. Mrs. Scott is seated on the carrier of the Matchless.

to avoid Worcester it would be better to go through Barnet, St. Albans, Dunstable, Fenay Stratford, Dunchurch, Coventry, branching off the Coventry-Birmingham Road at Stonebridge, and proceeding to Llangollen *via* Castle Bromwich, Brownhills, pass to the south of Cannock, and follow Watling Street through Gailey to Wellington and Shrewsbury. The former is the more hilly route. In view of the present condition of the Llangollen-Corwen-Bangor Road (see *The Autocar* of the 19th inst.) we should recommend the following in preference to either of those mentioned. Route 2 to Coventry, then *via* Kingsbury. Two Gates (turn to left and avoid Tamworth), Fazeley, Lichfield, Rugeley, Great Haywood, Stone, Nantwich, Chester, Flint, Prestatyn, Rhuddlan, Abergele, Conway, to Llangollen.

Burford to Southsea.

? (1.) Which is my best route by motor cycle from Burford in Oxfordshire to Southsea in Hampshire? Are there any notably dangerous points *en route*? (2.) As I shall be spending a few weeks at Southsea, could you advise me as to the most reliable place to garage my motor cycle? Are garages generally responsible for risks, *e.g.*, fire or theft? About what rate per week should I expect to pay for garaging? (3.) Is it worth my while to join the Auto Cycle Union? I do a good many long rides in the year. (4.) My machine is a $3\frac{1}{2}$ h.p. Excelsior, 1910, cost 44 guineas, has done about 1,600 miles. I should rather like a free-engine machine; what steps do you think would be best for me to take? Have a clutch fitted, or see whether I could give the old machine in part exchange for a new one? About what money ought I to expect for the above machine if I sold now? apparently unscratched and scarcely any rust on it. (5.) To what cause do you attribute the fact that when one is driving over a lumpy road full of hollows it is very difficult to drive slowly, and misfiring takes place from time to time, and the motion becomes very jerky? (6.) Would it be possible and would it entail much expense to have an adjustable pulley fitted to the above machine? (7.) What speed do you consider to be the most economical speed for driving when touring on a $3\frac{1}{2}$ h.p. machine? Does the speed vary with the machine?—W.N.R.G.

(1.) Your best route would be as follows: Burford, Faringdon, Wantage, East Ilsley, Newbury, Whitechurch, Winchester, Botley, Fareham, Cosham, Portsmouth. If you wish to avoid the heavy traffic between Cosham and Portsmouth, you may go to Gosport and then take the ferry. (2.) We can thoroughly recommend the garage of the Southsea Automobile Co., Ltd., 20, Granada Road, Southsea. You would have to make an arrangement with them as regards the charges, as we do not know these. (3.) Certainly it is worth your while to join the Auto Cycle Union. (4.) If you are satisfied with your present machine it would be well to fix up such a fitting as the Mabon clutch (the Mabon Motor Works, 54, High Road, Finchley, N.) If you sent your old machine back you would probably be allowed about £25. (5.) The trouble is due to the float being joggled up and down

by the vibration of the road, causing too strong a mixture. (6.) No, we should say you could fit an adjustable pulley without much difficulty; in fact, the clutch we have recommended is supplied with one. (7.) About 25 m.p.h. Yes.

Queries—A Basketful.

? (1.) Acceleration. Is it permissible to slam open the throttle and air levers immediately one is seated on the saddle, or is not this bad for the engine, etc? (2.) Chain drive. Is it safe to ride with the chain having a considerable amount of sag (though not sufficient to pull chain off the sprockets by the fingers)? I think a slack chain is better for the bearings. (3.) Low gear work. What would be the cause of rather "jerky" running on the low gear, with a two-speed machine? The engine is all right, and the gear is adequately lubricated. I also notice occasionally that the steering is a bit "wobbly" when running very slowly, which was not the case with my last machine—a single-gear one. (4.) Retarding spark. When running at a low speed in traffic, is any harm done by the ignition being kept advanced (magneto)? I imagine the engine would overheat if the spark were retarded for more than a few minutes at a time. (5.) Lubrication of twins. I have heard of the back plug of twins sooting up, and I have observed that if the oiling is generous it is always the rear silencer that begins to smoke first. Does not this indicate beyond all doubt that the rear cylinder gets more oil than the front one? And, if

so, why is no effort made to introduce a sort of "baffle plate" to prevent an undue amount of oil entering one cylinder, as compared with the other? I may say that my remarks apply not only to V twins, but to horizontal as well.—OILE.

(1.) Naturally, it is kinder to the engine to open the throttle, etc., slowly. (2.) There is no object in riding with a slack chain. The chain should be just the right tension. The ideal adjustment is to set it so that there is no appreciable tightness, and yet it links up so that it imposes no strain upon the bearings. (3.) There might be a variety of causes for this trouble; probably an incorrect mixture. With regard to the steering, this may be some defect in the design of the machine you are now using. Some machines steer very much better than others. (4.) The ignition need not be quite advanced; you may retard it, say, one quarter if you have to run very slowly for a short time, but it is better to close the throttle than to retard the spark unless engine knocks. (5.) We do not think there is much doubt of the back cylinder getting more oil than the front one. In cases of this kind a baffle plate should be fitted, and we do not know why this has not been done.

EXPERIENCES WANTED.

Readers who desire to have information about the experiences of other riders with any particular machine, gear, lamp, tyre, etc., are invited to make use of this column, but it is requested that stamped addressed envelopes be enclosed for the forwarding of replies.

Hints & Tips

for Motorcyclists.

THE N.S.U. TWO-SPEED GEAR.

376. The N.S.U. two-speed gear is one of those pieces of mechanism which the amateur rider will do well to let alone. It is emphatically not a thing which he should take to pieces to "see how it works," for he will have a rare job to get it together again, and, indeed, in most cases, a dismantled gear will have to be returned to the makers for re-assembling. I have known gears of this make which have run for 10,000 miles without other attention than oiling, but the meddlesome type of owner will probably complain that the gear is troublesome. The gear needs regular lubrication with a thinnish engine oil. No owner need be afraid of over-oiling; its worst effect is to make the high gear slip on full throttle until the surplus oil has been thrown out. Under these circumstances the low gear does not slip, and so any hill can be climbed with certainty. It is advisable to use a force pump in oiling, as with a squash oilcan it is difficult to make sure how much has been injected. I find I get the best results by injecting half a sherry glass of oil every 200 miles. The most fatal thing that can happen to the gear is to let the main adjustment work loose. This is of a dual character, and consists of a nicked locking ring just outside the pulley flange, which, in its turn, hides a locking grub-screw

beneath the ring. The latest types have two of these grub-screws. If the ring works loose, i.e., slides up against the pulley flange instead of lying away at a distinct gap from it, the nick in the ring may overcome the grub-screw, which will then jar out, and both guardians of the adjustment are thus lost. When the owner discovers the state of affairs he will probably think it is only necessary to tighten the locking ring and insert a spare grub-screw. In some cases this will suffice, but, as a general rule, one or more of the balls in the big ball race will have slipped over the edge of their ball race into a cup-shaped depression behind it, and if the gear is run in this condition the ball race will become corrugated and the balls will be crushed. But if care be taken to keep the locking ring tight

the grub-screw cannot be lost, and no trouble need be apprehended. After a long mileage, wear of the parts may necessitate a new position of the grub-screw for which a fresh hole must be tapped. If the gear is taken apart, the main trouble is to replace the spring and its washers. The English firms who fit the gear all employ a special and very complicated tool to refit these parts, and even then their fitters occasionally spend half an hour in coaxing the parts into position. I do not know what tool the German house employs, but their men certainly do not rely on ordinary garage tools. I hope this warning will prevent any amateur from taking his gear to pieces. If the gear is left alone and the locking ring kept tight no trouble need be apprehended beyond under-lubrication, in which case the low gear pinions will seize and the low gear will go out of action. The tips are as follows:

1. Never take the gear to pieces.
 2. Always see that the locking ring is screwed tightly away from the outer pulley flange.
 3. Oil regularly.
- (Not every user of this gear is aware that the gear may be slipped on both high and low gears by judicious manipulation of the control levers. The gear improves in smoothness and elasticity after a few hundred miles running.)

SPARKLETS.

A Good List of Records.

The Aston Motor Accessories Co., Ltd., Talford Street, Birmingham, advise us that they obtained no less than eleven records on machines fitted with their carburettors during last month.

The Value of Tuning up.

The attainment of a speed of over 64 m.p.h. for a mile on an engine measuring 76 x 59.5 mm. is an excellent performance, and shows that Harry Martin knows all there is to be known about tuning up. It is an open secret that Martin uses a valve gear of his own design.

A New Spring Fork.

With regard to the Lanzerotti spring fork which was described in our issue of 31st August, it should also have been mentioned that all communications with reference to it should be addressed to Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.

A Rudge Record.

An advance copy of a new catalogue of the Rudge motor bicycle has just reached us. This booklet is well got up on art paper, and besides illustrations and a full specification of the various models and a long list of successes achieved, there are hints and tips on the management of Rudge machines, including removing the wheels and cylinder. At the end of the book there is a list of spare parts, the smallest details being priced for ease of replacement. Five pages are devoted to recommended accessories for the Rudge.

M.C.C. HILL-CLIMB AT SUNDON.

A. L. Ommaney making a fast climb on his Rudge.

Derbyshire Hill-climb Cancelled.

An open hill-climb had been arranged by the Derby and District Motor Cycle Club for September 30th, but the event has now been cancelled.

A Bargain Sale.

There are only three more days of Messrs. Godfrey and Applebee's end of season sale, and we have been specially asked to mention that for the convenience of motor cyclists who are engaged during the day the company's showrooms at 208, Great Portland Street, W., will be open until ten o'clock each evening during the sale.

Sidecars.

W. Montgomery and Co., of Coventry, who, as all our older readers know, are pioneer sidecar makers, have lately devoted a considerable amount of attention to the production of a light coach-built sidecar body, and the result of their efforts is a roomy and most comfortable body, which is very little, if any, heavier than the standard pattern wicker chair. The springing of the chair is also a point which has received considerable attention, and we have proved, from personal experience of a Montgomery sidecar attached to a Triumph, that the makers' efforts have not been in vain. With a fairly light sidecar and a 3½ h.p. machine, it would surprise many the wide field that may be traversed, provided a fairly low gear be used, say in the neighbourhood of 5½ to 1.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Northumberland, Cumberland, Durham, and Westmoreland.

York and Lancashire.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

Norfolk, Suffolk, Cambridgeshire, Huntingdon, and Bedford.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants. Channel Islands.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

Somerset, Devon, Dorset, and Cornwall.

WAUCHOPES

THE ONLY MOTOR
EXCHANGE IN
THE HEART OF
THE CITY.

OFF FLEET STREET,
NEAR LUDGATE.

Phone: 5777 Holborn.
Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

THAT CONTINUAL STRAIN

to which the back is subjected during Motor Cycling has now received its antidote in the production of the

"CHEMICO" Motor - Bike Back Rest.

¶ The "Chemico" Motor Bike Back Rest is simple in construction, yet effective.

¶ The Belt fastened round the waist is connected to a specially designed hook on handle-bar pillar, and is held in position by the tension on this connecting strap produced by the body.

¶ The mere removal of this tension being sufficient to release the rider, it is impossible to become a prisoner.

¶ Two spiral springs attached to the connecting strap absorb all shocks and greatly add to the help and pleasure to be derived from this ingenious device.

INDISPENSABLE TO THE DISTANCE RIDER.

SIMPLY ENORMOUS!!!

The quantity of Sidecars we have made and sold this season has been simply enormous. **THE VALUE IS THERE**—that accounts for it. By working day and night we can still deliver from stock. All models are fitted with

Quick DETACHABLE JOINTS

as illustrated below.

This is our Model de Luxe. Complete £5 : 5 : 0 Complete

FARRAR'S HALIFAX SIDECARS.

Absolutely the finest value on the market.

LESS POWER.

It is admitted by experts that, owing to the unique design, far less power is required to propel Farrar's Sidecars than any other style on the market. NOTE OUR front arm which grips the Sidecar CENTRE. Nothing lopsided about this attachment.

All our Sidecars are now fitted with Farrar's quick detachable joints and cranked back axles, refinements found on very few other makes.

MODEL "DE LUXE" £5 5
MODEL "C" with cane body £6 0
MODEL "D" with coach-built body £7 0
MODEL "E" with reversible child's seat £6 10
ALL COMPLETE with MUDGUARD AND TYRES.

Discount to the Trade.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s, etc.

LIGHT, STRONG, AND SPLENDID VALUE.

SPRING LIKE A CAR.

- 31** h.p. Rex, new accumulator and belt, Palmer tyres, splendid condition; £10.—Puckeridge, 47, Liberty Hall Rd., Addlestone.

You pay too much
for accumulator
ignition—

put an end to it—

—and not only cut down unnecessary expense, but also relieve yourself of all worry and trouble of this unsatisfactory means of ignition.

Employ Hellesen Dry Batteries: the initial cost is practically half that of accumulators—subsequent upkeep is absolutely nil—they never get out of order, and are always ready for use—dry and clean.

The price of a Hellesen Battery is only from 6/6, and for this figure it is possible to run upwards of 2,000 miles—156d. per mile—with perfect security against the semblance of ignition troubles.

This is not all, mark you—when its capacity has dropped too low for ignition purposes, it can be used in the Hand Lamps as well as for bells, etc., and as such will last for years—a quality which affords much satisfaction to practical motor cyclists.

HELLESEN DRY BATTERIES.

Write to-day for our interesting booklet, which fully describes Hellesen Batteries—it is post free; also ask for particulars of our famous coils, and other useful accessories.

A. H. HUNT,
115-117, CANNON STREET,
LONDON, E.C.

WILTON Cycle Co., Victoria, S.W., have several combinations; Clyno, Chater-Lea, Sarolea, Kerry-Abingdon, etc.; from £20.

WILTON.—8 h.p. Minerva, twin-cylinder, Mabon clutch, Whittle belt, Millford castor sidecar, cane body; £25.

5-6 h.p. Twin Rex, cantilever, free engine, new tyres, cane sidecar; £20; after 6.30 o'clock.—28, Grove Lane, Stamford Hill.

TRIUMPH, December, 1910, standard model, Chater-Lea sidecar, all fittings and spares; £42/10.—13, Blenheim Crescent, S. Croydon.

5 h.p. nearly new Chater-Minerva, sparking machine, very fast, upholstered sidecar, 21 h.p. F.N.; lot £30.—395, Strone Rd., Manor Park.

F.N., 2-speed, 2 1/2 Palmer cord, special sidecar, electric lamp, spares, splendid condition; £35.—Write, 111, Mount View Rd., Stroud Green, N.

3 1/2 h.p. Kerry, 2 speeds, free, chain drive, B.B., Chater 32 sidecar, coach body, 24 worth spares; £20; trial.—J. Cotton, 27, Station Rd., Hanwell.

8 h.p. Twin Minerva, Bosch magneto, h.b.c., spring forks, free engine (in back hub), and Montgomery sidecar; £32.—Hough, Theatre, Walsall.

1910 Roc, 4 h.p., single-cylinder, 2-speed, free, Whittle lamp, h.b. tools, new torpedo sidecar; £36.—Burrows, Clothier, Cudworth.

5-6 h.p. Twin Peugeot, Millford castor, Roc 2 speeds, free, Bosch magneto, Amac, new Rom non-skid; bargain, £50.—73, High St., Bexley, Kent.

1909 Triumph, and nearly new sidecar, new Rom and tubes, belt, overalls, etc.; 36 guineas.—Aldridge, 127, Wimborne Rd., Bournemouth.

ROC Twin, 6 h.p., 2-speed, Bosch, Amac, adjustable spring forks, 650x65 Dunlops, and Oakleigh sidecar; £25.—Ives, 44, Mill Lane, Brixton Hill.

SCOTT, 1910 1/2, excellent order, Millford sidecar; dealer offer £42; best higher offer obtains.—Scott, Elmhurst Farm, Matfield, Paddock Wood, Kent.

1907 5 1/2 h.p. Twin Rex, sidecar, Whittle belt, Continental tyres; £24; exchange 3 1/2 h.p. magnet machine.—Brain, 11, Broadway, Wimbledon.

PHOLON and Moore, 1911, and sidecar, many extra fittings, speedometer, etc.; cost £71, £52.—Phelon and Moore, 5, Percy St., Tottenham Court Rd.

MATCHLESS 7 h.p. J.A.P., 1910, in new condition J.A.P. clutch, new Palmer cord back, all spares £41; any trial.—Tassell, Anglesea Rd., Woolwich.

The Future of the Quarterly Trials.

THE last Quarterly Trial of the year, which will be held on October 14th in the Midlands, is the last of a series decided upon at the meeting of the A.C.U. Council which took place at Nottingham in the autumn of 1910. Over eighteen months ago the Motor Cycle Manufacturers' Union, resenting the number of competitions the trade had to support, chose the Quarterly Trials as the scapegoat, and attempted to withdraw its support entirely. The Manufacturers' Union was only partially successful, as unanimity among the members did not prevail. Naturally the younger firms wished to give their products all the publicity they could, hence the absence of universal agreement, and it is these younger firms who have our full sympathy. No one would pretend that a one day run can be as good a test as a six days' trial, but no one, on the other hand, can deny it is a better test of a machine—if the course be stiff enough—than a local hill-climb, and to the latter the Manufacturers' Union, strange to say, does not object in the slightest. Both bodies should reconsider the question, as it would be a pity to drop the Quarterly Trials altogether. The winter trial undoubtedly proves the weather-resisting qualities of the machines, the spring trial gives a chance for the new models to gain their laurels early in the season, the autumn trial is an opportunity for kudos to be gained by next year's machines at a time which is most valuable to their makers, namely, just before the Show. The summer event could quite well be dispensed with, especially as it was not well supported this year. An A.C.U. council meeting will shortly be held, and we hope the question will then be re-opened and settled in a satisfactory manner.

1912 Models.

THOUGH it is yet too early to describe in detail next year's design of motor cycles, we have lately discussed new models with a number of leading designers, and, having also been privileged a private peep at new designs in their chrysalis stage, we may outline briefly some changes and innovations to look for at the November show. First and foremost, the change speed geared mount is to loom more largely in the public's eye than ever before. All kinds of speed gears are being tried by practically all the leading makers, and we ourselves know of five different designs of three-speed gears undergoing tests on the road. As regards the two-speeder, recent descriptive articles in these pages have made it clear that the counter-shaft type of gear is gaining popularity, and there is a great deal to be said in its favour. Gears infinitely variable between two limits are engaging the attention of at least six firms, but whether they will ultimately be adopted remains to be seen. Still lower frames will be in vogue next year, dropped top tubes will be more in evidence, and every reader will be glad to hear that more makers are concentrating their attention on the comfort of the rider. Spring seat-pillars promise to be quite common by show time. A device which is undergoing test on two or three makes of engines is a half compression device enabling a walking start. Engine design is undergoing a change. A large firm who have hitherto fitted overhead mechanical inlet valves will resort to the side by side valve arrangement next year, and a further modification to be noted is the offset cylinder. Two leading firms at least, we are told, will standardise this form of engine for 1912.

THE Edinburgh and District Motor Club held a very satisfactory hill-climb on that notorious gradient Amulree on Monday of last week (a general holiday in Edinburgh). The competition attracted fifty-three entries for the eight classes, and of these forty-eight duly started. The classes are tabulated hereunder:

- Class 1.—Novice class (handicap).
- Class 2.—Handicap (under 400 c.c.)
- Class 3.—Handicap (400 to 600 c.c.)
- Class 4.—Handicap (over 600 c.c.)
- Class 5.—Tyro class (handicap).
- Class 6.—Scratch class (up to 600 c.c.)
- Class 7.—Unlimited scratch class.
- Class 8.—Passenger class (handicap).

The hill, as most motorists know, is a long stiff one, having for its *pièce de résistance* a double hairpin bend, both bends occurring within a few yards of each other and the road being very narrow. All or most of the riders were private owners, but this did not detract from the quality of the sport, and some very fine exhibitions of riding and corner work were seen during the afternoon. Starting within a few minutes of the schedule time (1 p.m.), the whole competition was run through without a hitch or accident to mar the occasion, finishing a few minutes before four o'clock.

The timing was to have been by telephone, but the apparatus did not materialise in time, so flagging was resorted to, and as the top of the hill could be clearly seen from the bottom, this method proved very effective, and the progress of the competitors up the hill was marked by the change from white to red of the flags held at different points on the hill by officials.

Specially fine corner work was shown by J. W. Adamson on a $3\frac{1}{2}$ h.p. Triumph, J. Gerard on a $3\frac{1}{2}$ h.p. Bradbury, and A. H. Alexander on a 7 h.p. Indian.

Fastest times for the day were: Single-cylinder, J. W. Adamson ($3\frac{1}{2}$ h.p. Triumph). Twin-cylinder, A. H. Alexander (7 h.p. Indian).

Out of the forty-eight starters only eleven failed to reach the top, which, considering the gradients and

Scene at the starting point. Amulree Hill may be seen winding upwards in the distance.

Open Hill-climb on Amulree.—

Weighing J. Cumming's two-speed Douglas before the start.

the corners, shows a very good average. The Scott machine ridden by Colin Macmillan made the cleanest work of the corners, going round with no fuss and arousing a cheer from the crowd of spectators assembled here. Macmillan also secured second place on formula in Class 3.

How the Passenger Machines ascended the Hill.

The passenger class aroused considerable interest in view of the tremendous head wind, and doubts were expressed of their even reaching the corners, but both Macallum on a 7 h.p. Chater-Lea and sidecar and J. R. Alexander on a 7 h.p. Indian and sidecar succeeded in reaching the top in good time, though both were penalised forty-five seconds for assisting the machines on the corner.

On the first bend it seemed as if Macallum would never get his machine clear of the bank, but owing to his sidecar (which is of special design) having the wheel under the seat, he just managed to do it and got up with slight assistance, making fastest time after a splendid exhibition, and winning on formula.

J. R. Alexander (7 h.p. Indian and sidecar) safely round the first bend. Both driver and passenger had to jump out and run alongside a few yards higher up the hill.

Alexander on the Indian and his passenger both had to dismount on the corners and assist the machine, but got up. The passenger gave a remarkable display of agility in the way he hopped out and then hurled himself in again after rounding the second bend.

P. Tolfree (the secretary) on a 3 h.p. (431 c.c) Matchless and A. F. Downie on a 3½ h.p. Ariel both had spills through taking the first corner too fast, but no damage was done.

Results on Handicap.

CLASS 1.		Time	Fig. of
		in secs.	merit.
1.	Nicholson (5 h.p. Indian) ...	124½	6918

CLASS 2.			
1.	D. L. Rankine (2½ h.p. Singer) ...	209	6401
2.	Cumming (2½ h.p. Douglas) ...	271	3376
Both penalised 45s. for pedalling.			

CLASS 3.			
1.	J. Gerard (3½ h.p. Bradbury) ..	121	7977
2.	C. H. Macmillan (3½ h.p. Scott) ...	174	5896
J. W. Adamson was disqualified for riding his machine without a tool-kit.			

A. J. C. Lindsay (5 h.p. Matchless-Jap) at the first bend. A moment after the photograph was taken the machine skidded.

CLASS 4.			
1.	A. H. Alexander (7 h.p. Indian) ...	102	7741
2.	J. W. Adamson (7 h.p. Indian) ...	112	6984
3.	J. R. Alexander (7 h.p. Indian) ...	110½	6934
4.	C. McGregor (5 h.p. Bat) ...	116	6491

CLASS 5.			
1.	Nicholson (5 h.p. Indian)...		
2.	A. F. Downie (3½ h.p. Ariel) ...		
} Got farthest up the hill.			

CLASS 6.			
1.	J. W. Adamson (3½ h.p. Triumph) ...	115	
2.	J. Gerrard (3½ h.p. Bradbury) ...	121½	
3.	C. H. Macmillan (3½ h.p. Scott) ...	214	

CLASS 7.			
1.	A. H. Alexander (7 h.p. Indian) ...	98½	
2.	A. J. C. Lindsay (5 h.p. Matchless, single gear) ...	106	
3.	J. R. Alexander (7 h.p. Indian) ...	106½	
4.	J. W. Adamson (3½ h.p. Triumph) ...	114	
5.	J. Gerrard (3½ h.p. Bradbury) ...	118	
6.	C. H. Macmillan (3½ h.p. Scott) ...	167	
7.	R. A. Macmillan (3½ h.p. Scott) ...	172	

The entries numbered fifty-six, and fifteen different makes were represented.

CLASS 8.			
1.	J. G. Macallum (7 h.p. Chater-Lea & sc.)	234	4639
2.	J. R. Alexander (7 h.p. Indian) ...	250	4080
Both penalised 45s. for assisting.			

MORE MARRIED COUPLES WHO MOTOR CYCLE.

The photograph reproduced depicts Mr. and Mrs. Townsend, of Ballyshannon, County Donegal. Mrs. Townsend has now completed over 2,000 miles on her 2 h.p. Motosacoche, and finds the machine especially suitable for her needs. It climbs most hills satisfactorily, but needs light pedal assistance on occasion, though not the laborious kind necessary with a heavyweight. Mr. Townsend, who rides a $2\frac{1}{2}$ h.p. two-speed A.J.S., is likewise very satisfied with his mount, and has yet to find a hill in any ordinary day's running which cannot be surmounted; even after running nearly 2,000 miles without attention the machine devoured the steep gradient of Sutton Bank with ease. The couple have lately been enjoying their vacation in Yorkshire, after having ridden from Ireland on their machines. One day's run was a trip of 130 odd miles, this being the longest distance ridden by Mrs. Townsend in one day. The tourists find our roads far superior to those in Ireland, but they are rather surprised at the number of reasonable hills which can be found in one day.

Mr. and Mrs. Townsend, of Ballyshannon, County Donegal. The machines are a two-speed A.J.S. and Motosacoche.

AN ENDLESS BELT DILEMMA.

A reader signing himself "Faust" writes: I have for years been an admirer of "Ixion" and his "Occasional Comments," and have endeavoured humbly to follow his advice when possible, but he has at last led me into a regular tangle. I may say that I am an obstinate man, and when I set out to do a thing I like to carry it out. Now I was charmed with the idea of an endless belt and determined to experiment, so I took off my Whittle and fixed it up apart from the machine, and then, having noted the time, set to work to fix it in position. First of all I

detached the back wheel and foot brake fittings as advised and slipped the belt in. As I found this fairly easy I was quite jubilant; so I put the wheel in place and refitted the brake, carefully adjusting everything. Then I looked at my watch, and found that I had only been twenty-seven minutes on the job. Concluding that it would only be necessary occasionally, and that with practice the time taken by the operation could be lessened, I called my wife to look at the result of my labours and went to dinner.

After dinner, having a few calls to make, I slipped the belt in position, or at least tried to do so, but somehow it would not go right. So thinking I had made a mistake, I took off the back wheel again; then I found the mudguard stay in the way and removed that, next the stand barred my progress and that had to come off too, the machine being supported on two kitchen chairs and a broom handle (46 mins.) About this time my wife came out to know what all the noise was about, and insisted upon taking the children out of hearing. "Ixion," I said, "says that an endless belt can be fitted to a motor cycle, and 'Ixion' is an honourable man, and I am going to do it or be—!" Rash words! However, as I said, I am an obstinate man, so I carefully re-read the paragraph, and found that in some cases the rear stays need springing out. But how can the stays be sprung out when they are brazed up with the frame? It does not seem right to use a hack-saw. More thinking (time 73 mins.) The belt is now inside the stand, mudguard, and carrier stays, but outside the frame, and I now notice that it could have been placed in this position without removing the back wheel at all, which in my trusting innocence I have already done twice. More reflection! (94 mins.) Is "Ixion" pulling my leg, or is the whole thing a problem story with the moral not "Look before you leap," but "Think before you speak"? I have, as I said, sworn to fix the belt or be—. The former I cannot do, and the latter I would rather not. What is to be done? It seems to me that in some cases the endless belt would have to be put in before the machine was brazed up, in which case what would happen to it during the enamelling and stoving processes? Like Brutus, whom I seem to have in my mind, "I pause for a reply."

Mr. and Mrs. Davis, of Sparkbrook, Birmingham, whose mounts are respectively a $3\frac{1}{2}$ h.p. Singer and a 3 h.p. Brough.

In Wales and the West.

Seventh Day.—Porlock to Dunster and Ilfracombe, 48 Miles.

In the morning we cleaned some of the accumulated mud off our machines, adjusted the brakes, and then set out to climb the hill. My engine was somewhat out of tune and had a good weight to carry, and so stopped twice on the hill, but after a brief rest each time started again quite easily from a standstill on the steepest part and went right up to the top, and this with absolutely no adjustment to the engine or gear. It just did it in the day's run, so to speak; the high gear was $4\frac{5}{8}$ to 1. A got up all right, though he had some stops with the low gear band slipping, as it did not provide enough gripping surface for the heavy work it had to do.

In the afternoon we left for Minehead and Dunster. The road to Minehead is fairly level, but exceedingly curly and full of cross roads. We here bought food supplies, and amongst other things got a fair-sized melon. It was too big for any of our boxes, so the only way we could think of to carry it was to tie it on to A's handle-bar toolbox, and this we did with the aid of some string. But the melon soon became lively and tried to get loose from the string, and knocked a hole in itself against the speedometer and made various unsuccessful attempts to roll on to the road, but by careful dint of keeping one eye on the melon and the other on the road A managed to pull through till we found a suitable place for "lunch." We just finished the melon!

Soon after we left Dunster it began to rain, and the next part of our ride was almost a nightmare. If anyone has driven that way on a wet day with smooth tyres and brakes on the back wheel only I am sure he will agree with me. Exmoor is the home of the wild red deer—it is also the place where roads are made of red earth, and this seems to turn to clay when wet! The road is narrow, curly, and hilly, and there are numerous gates to be opened *en route*. In order to go down some of the hills slowly enough I had to keep the brakes on, and ever and anon the back wheel would come sliding round to the front and send the front wheel into the bank. A, who had a front wheel brake, experienced no great inconvenience. Moral: Have a front wheel brake and studded tyres if you want to ride in that part of the world in wet weather, and take no notice of some writers' contempt of front wheel brakes. Our low gears were comforting, too. I know I drove for some miles on mine, and would not like to attempt that ride without it.

I have no doubt if we had had time to admire the views they were very fine from an impressionist point of view—the moors and the mist, the mountain ash and the softened outlines. The low rolling hills were wreathed in mist, and everything was dank, dripping, and deserted.

At last we reached a main road which was dry, and we *did* just make up for past misfortunes—in fact, I was dry when we got to Ilfracombe. The last few

A SUMMER TOUR.

(Concluded from page 975.)

miles into the town were superb as we curved and wound along the road through the woods and the pretty village of Combe Martin, and at last slid down into Ilfracombe itself. The cloud effects after the rain, the cliffs and sea lighted by the after-glow of sunset, accorded well with my feelings of relief, and enabled me to forget the unpleasantness of Exmoor.

We spent the next two days at Ilfracombe, and had a lazy time on the beach in the sun as we watched

the little fisher children picking "winkles," and then we helped them make a fire and boil them, but politely declined the invitation to join in eating them. We admired the views and the people—in fact, A remarked that Ilfracombe seemed to be all girls. The number certainly was remarkable.

The second day of our stay was one of continuous rain until evening, when I took photographs of a genuine Ilfracombe sunset.

Tenth Day.—Ilfracombe to Tintagel, 67 Miles.

As it was still raining I went out and bought a large pair of sailor's yellow oilskin trousers. When I turned up with them at the hotel I gave A a fright and spread consternation amongst the hotel people. But they kept out the rain and only cost 4s. 6d.

After some difficulty in starting my engine we were on our way to Barnstaple and Bideford, and soon the sun began to shine. Our next stopping place was Clovelly, and here I had to wait about half an hour, as A had had a patch blow off the puncture he got at Porlock.

We explored Clovelly, which is the quaintest place imaginable, the houses being all perched one above another on the hill side. The High Street consists largely of steps, and all packages have to be carried up and down by donkeys. It is necessary to go through houses in some parts to get along the street at all. The whole of the surrounding coast is thickly covered with trees. On resuming our way we found the roads dry and the sun shining, but we had to face a hurricane. We left Bude on our right, following the newly-cut road, and soon turned off the main road to Boscastle, and thence to Tintagel. Here we found "digs" and dinner (for which A *would* shave as there were some ladies). We went down and explored King Arthur's Castle, and as we stood on that barren headland with the wide Atlantic rolling in and dashing with fury on the rocks a few hundred feet below, the sun was rapidly sinking in an almost cloudless sky and the whistle of the gale and the roar of the sea gave us a most eerie sensation. After watching the sun set we retraced our steps along the steep and slippery path to the shore, and then went into the famous natural tunnel in the rocks through which the sea runs at high tide. The far end of the tunnel was practically in darkness, just a glimmer of misty green light filtering through to us, and ever and anon there was the roar and thunder of the waves reverberating in the darkness.

In Wales and the West.—

To anyone who is fond of wild and rocky coast scenery let me recommend this part and of all places Tintagel. It has, in my opinion, very few rivals on our coasts and I speak from considerable experience.

Eleventh Day.—Tintagel to Redruth, 48 Miles.

We left Tintagel about noon, having been very well treated at "Camelot." We soon struck the main road through Wadebridge, and made fairly good time. An idiot driving a cart pulled to the wrong side of the road and sent me into the gutter, so I stopped and *gently* explained the rule of the road to him. Leaving Wadebridge we were warned of a "trap," and so drove

After a few miles my tyre went down, and I spent forty minutes over it and concluded A would be many miles away, but when I turned the next corner I met him just starting his engine; *his* tyre had been down, too.

In half an hour bang! went mine again, and I found a large piece of iron in it. I mended the two holes caused thereby and resumed, but within three miles down it went again. This time it

I walked on the rocks, bought postcards, took photographs, and got a man to photograph us with "The End" in the background.

We now turned "homewards" and were soon back in Penzance, where I bought a new butt-ended tube. Of course, my tyre kept up for about two days afterwards!

Near Hayle we met four motor cyclists, two of them being ladies, and I must say they looked really charming! I am sure girls need not be afraid that they will look "guys" on motor cycles with two such examples. Since then I have taught my sister to ride my machine, and she certainly picked it up as quickly as most of

the other sex I have taught—just a short free-wheel with the engine "out," then a lesson in manipulating the levers, a push, and away she went as steadily as an old hand.

By-and-by we got on to Goss Moor and went speeding along at a rare bat for a few miles till my engine suddenly struck work with a chinking sound. I said "Hullo, broken connecting rod." A stopped, and when we took the cylinder off we found it *was* a broken connecting rod. We fastened a strap to A's

(1) A favourite occupation—A has tyre trouble at Clovelly.

(2) Clovelly from the harbour. High Street consists mostly of steps.

(3) Porlock, main street.

proved to be one of the somewhat jagged holes which had "run" from under the patch and made a slit in the tube. My longest patch would only just cover the hole, and did not keep the tyre up at all. There was nothing for it but to push up to the top of the hill and free-wheel down into Redruth, where I found a repairer who had a patch big enough.

As it was now dark, I decided to stay here, wondering somewhat where A had got to and what he would be thinking.

Twelfth Day.—Redruth to Land's End and Bodmin, 85 Miles.

I had more deflations and inflations of my tyre before I got to Land's End, but reached there about twelve noon. Here I found A strolling about on the headland and, naturally, wondering what had become of me.

machine, took the belt off mine, got two yokels to give us a push as A put his low gear in, and away we went, one engine pulling the whole 8 cwt. along at a steady 18 m.p.h. We had 4½ miles to go into Bodmin.

I put my motor up at Jane's Garage, and wired for a new connecting rod.

Thirteenth Day.—Bodmin.

I spent the morning in taking down my engine, and as it rained all day we were not sorry to be under cover.

There was great excitement in the town when the two ladies already mentioned came in on their motor cycles. I think *they* would have found clutches and gears an advantage.

Fourteenth Day.—Bodmin to Exeter, 64 Miles.

I had nearly got the old connecting rod repaired when the new one turned up. I put the engine

in Wales and the West.—

together and had it running in two hours. Quite a crowd came to see us off.

My engine soon got into its stride, and except for a patch of unrolled stones, Exeter was reached without incident—sixty-four miles in less than three hours. The road over Bodmin Moors is certainly hilly, passing, as it does, near Brown Willy, the highest hill in Cornwall, but the surface is good on the whole. Between Launceston and Exeter there is much climbing.

Fifteenth Day.—Exeter to Wincanton, 58 Miles.

On leaving Exeter we were stopped by the police and asked for our licences—the first time in our experience. Fortunately, I had one! I met a man soon after who had not, and he ruefully asked if I thought he could sell his machine for enough to pay the fine!

We made good running through Honiton and Chard—whereabouts we had some pretty stiff hill-climbing to do—to Ilminster and Ilchester. The weather and scenery were both glorious. Near Wincanton we were riding along side by side when suddenly a loud explosion came from A's back wheel and a cloud of dust flew up. He pulled up safely, although travelling at 30 m.p.h., and we found that it was a legacy of Porlock. The stone which punctured the tyre there had cut the canvas inside the cover, and now the tube had blown through and made a hole I could put my fist in! A went into Wincanton on my machine and wired for a cover to be sent from Bristol. We therefore spent the night at Wincanton. In the morning A found a 26in. by 2in. cover, so I put it and him on my carrier and motored back to the farm where we had left his motor.

Sixteenth Day.—Wincanton to Banbury, 120 Miles.

We changed the front cover to the back wheel and put the small cover on the front wheel, and were off in an hour.

We now began to make up time. We crossed the southern part of Salisbury Plain, with its long straight roads and rolling hills, our next stop being at Stonehenge. We inspected the triliths, which I need hardly describe, and I exposed my last film. We also met here a car owner-driver and his wife, and they unfolded a sad tale of the iniquities of garages.

We had been warned of a trap hereabouts, so went very slowly till we reached Andover, where we turned off the much frequented road, and, passing through much fine country, soon reached Newbury, famous for its battles, and then Oxford. Here we stayed a short time and had a look round.

An easy and pleasant road took us into Banbury, which we reached without incident about seven o'clock; our only stop (involuntary) during the day had been to tighten A's belt—or rather the motor's belt!

Seventeenth Day.—Banbury to Sheffield, 120 Miles.

This was the last day of our holidays, and we started on the last 120 miles with great reluctance.

We called at Warwick and admired the castle and the lovely river, on which were many boats, and then reached Coventry with its interminable tramlines.

On restarting I heard something rattling on my machine, but could not locate it. At Derby it seemed to come from inside the engine, so we stopped by the wayside and I took off the cylinder and there found

the trouble—the gudgeon pin set screw had come out and dropped into the crank case. This seemed a bit hopeless, but A remembered having read of a man who turned his machine upside down and shook the pieces out. Without more ado we turned mine over, pulled the piston round, and—out came the bits! In thirty-five minutes the whole business was done, and away we went

once more. The last thirty-five miles is somewhat intricate, but we arrived home without incident and just before lighting up time.

Thus ended our holiday, and work and dullness claimed us once more.

Epilogue.

Our chief troubles were with our tyres, and had it not been for these we should have saved on the average about an hour a day. I had three punctures in spite of a thorn catcher.

Until leaving Land's End we only saw about eight motor cyclists, but after that we saw literally hundreds.

We covered some 1,050 miles and used thirteen gallons of petrol each, this working out at eighty miles to the gallon all through.

I had altered my oil pump to give only one-third of a full charge, and this I gave every ten miles (by mileage recorder). This lubricated the engine perfectly; one quart of Price's A lasted 1,000 miles.

Our plans and equipment excited almost universal interest wherever we went. The absolute freedom of going or staying when and where we liked and being independent of all trains and other abominations must be experienced to be properly appreciated. I only hope these lines may be the means of encouraging others to go forth and see the country and get experience of mankind such as can be obtained in no other way comparable to motor cycle touring. If our misfortunes are a lesson to others, so much the better.

The tourists with their Rex and Humber machines on the cliffs at Land's End.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The State of our Roads.

[5903.]—Under the heading of "Current Chat" of your most useful paper you remark about the state of the Warwickshire roads, and suggest that the local authorities should adopt "the tar and stone-filling method for pot holes" more fully. If you are really fond of riding on roads repaired in this way I advise you to try a spin from Nottingham to Doncaster *via* Mansfield and Worksop, and I am under the impression that before your arrival in Doncaster you will change your mind.

Wishing your excellent paper (of which I am a regular reader) every success,
ARTHUR E. BALL.

In Favour of the Open Frame.

[5904.]—I was much pleased with your article respecting the design of the new model "Enfield" drop frame suitable for lady or gentleman.

May I point out some further advantages of this type of "drop frame" motor bicycle if it could be used in connection with the popular basket sidecar attachment. In the first place, those ladies who are naturally somewhat diffident in adopting the motor bicycle would have the advantage of accustoming themselves to riding and driving it under the guidance of an experienced friend accompanying them in the sidecar attachment; and in the second place, though most gentlemen would prefer to undertake the main part of driving through towns, and on frequented roads, yet in the country even the most ardent motorist would be glad of a rest and a pipe occasionally, seated in the chair and relieved of all responsibility; whilst to many lady cyclists this opportunity of driving themselves, and giving pleasure to others, would lend an additional charm and interest to the ride.

A. SMITH.

The Quality of Modern Tyres.

[5905.]—Your correspondent Mr. G. C. Pohlmann seems to have been very unlucky with his tyres. Recently I had a $3\frac{1}{2}$ h.p. Triumph which I used to use frequently with a sidecar. I had a rubber-stud Clincher cover on my back wheel which had done 3,000 miles solo before I started sidecar work, and I then got another 800 miles out of it with the sidecar, and it was not absolutely done then. I also used a R.O.M. cover on my back wheel; this after about 1,500 miles, mainly with the sidecar, showed very few signs of wear and was unpunctured.

I now run an 8 h.p. Matchless and sidecar, and on this I also fitted a R.O.M. cover, which, after riding over 1,000 miles nearly all on Devon roads and a great deal of that not on main roads, though showing signs of wear, will, I think, last me for another 1,000 miles. I do not mean to say that I am satisfied with this, as I am looking out for a cover which will wear better, but one would naturally expect an 8 h.p. machine to be more severe on tyres than a $3\frac{1}{2}$ h.p.

F. A. CLIFFORD.

The Margin of Safety in Sidecars.

[5906.]—As an old sidecar user I should be pleased to state my experience on the above. I have had special axles made that have appeared strong enough for a small car. These have overcome the broken axle, but not the bent axle. I have now found by experience that the only way to get over the difficulty is to have the wheel sprung apart from the motor cycle and sidecar.

You advise special sprung forks, and say, were it possible, a sprung frame. After getting this luxurious combination, fit a sidecar with solid axle and it will set up a side vibra-

tion more pronounced than the old-fashioned solid forks as used in 1900. I may say that I can thank *The Motor Cycle* for my conversion to the sprung wheel. I purchased a Garrard-Maxfield sprung wheel sidecar which I saw illustrated in *The Motor Cycle* of August 10th. This quite proved to me that the sprung wheel is as great a necessity (leaving out the question of luxury) as a spring fork on a motor bicycle.

I found that I could drive faster over a rough road, and could climb hills much better (no doubt caused by the greater speed) where previously with a solid axle I had to assist with the pedals. I also found it much easier steering, but cannot say if this is through the fact that the sidecar, wheel spindle, and the cycle back spindle are in complete line. I am a thoroughly satisfied spring wheel user, and am only surprised at anyone using a solid axle. Who would think of purchasing a solid fork motor bicycle?

H. FRANKLIN.

A Danger Spot in Leamington Spa.

[5907.]—I send herewith photograph of a danger spot in Royal Leamington Spa which, in the interests of motor cyclists, I hope you will reproduce.

My friend, Mr. F. C. Wood, the well-known rider, met with a serious accident here, crashing into the gate shown

The dangerous unlighted and dark coloured iron gates leading into the Victoria Park at the end of Avenue Road, Leamington Spa.

in the photograph three weeks ago at one o'clock in the morning. An iron spike penetrated his skull about three inches and lacerated the brain. There is a slight hope of his recovery, which I am sure all your readers earnestly hope for.

DOUGLAS O. KNIGHT.

Is a Larger Douglas Wanted?

[5908.]—Allow me to pen you a line in appreciation of your correspondent's letter [No. 5640] *re* Douglas lightweight. Being a rider of this splendid little lightweight, I would, for one, gladly welcome a, say, $3\frac{1}{2}$ h.p. or 4 h.p. model of this machine.

I have gone 2,000 miles over "colonial" roads on the Douglas without any trouble, but after travelling a long journey and having to finish up with several stiff hills, one then wishes one had a larger powered engine fitted. Of course, it would mean a large and perhaps risky step for Douglas Bros. to bring out a larger machine, and

Miss Myrtle and her Singer Moto Velo.

I would say that a larger Douglas would get over a lot of the difficulties a colonial rider has to contend with here.

For instance, some of the standard $3\frac{1}{2}$ h.p. with the magneto in front of the engine invariably get water into their magnetos, which, as motorists know, is no joke when twenty miles from the nearest depot.

Finally, if the makers of the Douglas do place on the market a larger type, and respond to colonial cries, let them strengthen the wheel rims and spokes, as a motor cycle here is useless unless it can stand rough and hard work. Wishing your splendid weekly ever the success it now attains.

Timaru, N.Z.

B.H.G.

The Lady Motor Cyclist.

[5909].—For a considerable period I had been feeling very seedy, and as my health did not seem to improve, I took a doctor's advice, viz., to let Nature work her own cure in the pure air of the seaside.

After considering the various fashionable watering places and finding them not to my taste, I eventually decided to

visit the little village of Lancing, midway between Brighton and Worthing.

I did not regret my choice, for after a week in the open air I felt fit to fight for a kingdom or a vote.

I explored all the show places in the vicinity, and wishing to visit further afield my thoughts flew to a bicycle, and I remembered that on my way to the front I passed a cycle store, in the window of which was the advertisement "Cycles: try one, buy one, see how they run!" The ridiculous ditty of "Three blind mice" ran into my head, and I always hummed it to the words of "Try one, buy one, see how they run," and I determined that I would try one. I entered

the shop and on explaining that I wanted a cycle was asked what kind I required. The Lancing air had evidently taken hold of me, for I answered with a laugh, "Oh, one that runs by itself." What was my surprise when my frivolity was met with a serious face and a "Certainly, madam," and in less time than it takes to tell the counter was strewn with catalogues of motor cycles, and I found myself, against my will, becoming interested in the art. Why should I wear myself out on a push cycle when for a few extra pounds I could enjoy all the pleasures of aeroplaning without its dangers? Anyhow that was how it was put to me, and to cut a long story short I soon found myself the possessor of a Singer Model 6.

Well that was some months ago, and I have not yet regretted the transaction, for I am the possessor of a comfortable, safe, and in every way reliable mount. I do my seventy or eighty miles in comfort, and the hills no longer are a bugbear. My regret is that I did not take to the motor cycle years ago. (Miss) H. MYRTLE.

[5910].—The photograph herewith was taken last Easter, and I thought it might be of interest to lady motor cyclists. The machine is a $2\frac{1}{2}$ h.p. Hulbert-Bramley, Minerva engine. At the time the photograph was taken it was running on an accumulator, though lately I have had a French magneto fixed. With this machine I have taken a friend to Southwold and back—sixty-eight miles—she on an ordinary cycle and I on my motor with just my hand on her back. We both like this method, as it enables us to separate quickly when cars come round corners almost on top of us. We had one or two stops, which I easily remedied. I have only been stranded once, the cause a worn out sparking plug. As I

Miss C. Bunn and her $2\frac{1}{2}$ h.p. Hulbert-Bramley.

had never bought one before, this is not bad. Of course, accidents will happen, but I am up to removing my tyres and mending my own punctures, fixing belt fasteners in my Shamrock-Gloria, and noticing whether shortage of petrol or the current cut off is the cause of a stop.

(Miss) C. BUNN.

Replies to the Hypoborean Protest.

[5911].—"Experto Crede's letter [No. 5876] comes, I think, as a timely warning. There must be many of you readers, who, like myself, are considering the purchase of a sidecar machine for next season, and the numerous advertisements of $3\frac{1}{2}$ h.p. sidecar models for 1912, combined with the

"I do my journeys of 70 or 80 miles in comfort, and the hills no longer are a bugbear."

recent excellent End-to-end record run, would make one believe that only a speed merchant or road hog may yearn after a higher powered machine. I quite agree with your correspondent that for a comfortable, reliable, and lasting go anywhere sidecar machine $3\frac{1}{2}$ h.p. is not sufficient, but I would go further and discard belt-drive in favour of chain. I have come to this conclusion after only some 2,000 miles with a certain $3\frac{1}{2}$ h.p. of 499 c.c. with Roc two-speed gear—the combined weight of passenger and self is about nineteen stone. On easy roads the combination is ideal, but it is a painful business if I have to encounter a few sharp hills (which can hardly be avoided in a run of any length in Scotland). In addition to insufficient engine power, I find that my frame is not strong enough—two of the back stays buckled the other day—and I know another sidecarist with the same make of machine whose frame broke through at the part where the sidecar is fixed on. I wish to get a machine that will take me and my passenger comfortably at a moderate pace, and that may be expected with care to last some time, and I fear I cannot get that in anything less than a 5-6 h.p. Unfortunately, however, I have been told, the running costs with the higher power will be very much increased, and the twin-cylinder engine is more likely to give trouble than the single. It would surely be of great interest to many of your readers to hear the experiences of some other private sidecar owners. It certainly would be to

PERPLEXED.

[5912].—I can heartily endorse all your correspondent "Experto Crede" says in his letter [No. 5876] of the 14th inst. Through lack of experience I was persuaded to purchase a low-powered machine to take a passenger, and I fondly dreamed it would accomplish all that was promised.

Our first long journey completely put the machine *hors-de-combat*, notwithstanding that we completely exhausted ourselves with vigorous pedalling to assist it up the very steep hills in these two northern counties.

From that time we could never go out even on a short run with any degree of pleasure knowing that at every hill it would fail us. During this season we have become the happy possessors of a 5-6 h.p. Bat-Jap with a two-speed gear which has given us a season of unalloyed pleasure, and the machine has never failed to take us up any hill.

After our experience of both classes of machines we are fully persuaded that for a sidecar combination we have no more than sufficient power. I would like to make the usual disclaimer, being no more than a satisfied rider.

Gateshead.

NOVICE.

[5913].—May I be allowed to reply briefly to your correspondent "Experto Crede," who places all singles in one category and condemns the lot as being unsatisfactory for sidecar work.

EDINBURGH M.C. HILL-CLIMB ON AMULREE.

J. Gerrard rounds the second hairpin bend at the limit speed, grazing the grass bank at the roadside. (See pages 998-999.)

"Experto Crede" is evidently unaware of the capabilities of a hefty single and two (or three) speed gear, and if an opportunity arises, I shall endeavour to prove that a big single (I have the Bradbury in my mind as I write this) is quite capable of taking sidecar and two persons of average weight (twenty stone) upon any journey that can be successfully tackled by a 5-6 h.p. twin.

"Experto Crede" lives in rather an isolated district, that abounds with hills, the like of which not one rider in a hundred ever sees in a season's touring.

In England, I should say that quite 75% of the sidecar machines met with on the road are propelled by single-cylinder engines. The simplicity, freedom from trouble, and low cost of upkeep, are all points that tend to make the single-cylinder the most popular type of machine.

Before very long (if I am not vastly mistaken) most of the worst hills in the kingdom will be conquered by the single-cylinder machine with sidecar attached. Given a fair average route in Scotland, I will undertake to prove to "Experto Crede" that he has been rather too hasty in his wholesale condemnation of the single-cylinder machine for sidecar work.

HUGH GIBSON.

P.S.—Wray and myself weighed just over twenty stone on the record ride. Eastwood and I weigh twenty-one stone.

The Stiffest Reliability Trial.

[5914].—I have read Mr. W. Pratt's letter with considerable interest, and I am indeed pleased that this gentleman has taken this matter up. Nobody would be more pleased than myself to see the trials for the future run off under the conditions Mr. Pratt suggests.

I am also pleased to see that Mr. Pratt states as well as "Ixion," that the 1911 Scottish Trials were the most severe that have ever been held.

J. S. HOLROYD.

The Terrors of Sutton Bank—Are they Exaggerated?

[5915].—To those familiar with the hills mentioned in "EC 513's" letter, his statements are somewhat surprising. I climbed Sutton Bank and Kirkstone Pass from Ambleside on successive days three years ago, and although the surface of Kirkstone Pass was at that time much worse than Sutton Bank, I climbed it quite easily, although I had to run alongside my machine on the 1 in 3.9 portion of Sutton Bank.

There is no portion of Kirkstone with a gradient such as this, nor is there any bend on Kirkstone worse than the hairpin on Sutton Bank. "EC 513" seems to regard Sutton Bank with a good deal of contempt, but he would not climb it in the course of a hundred mile non-stop with a $4\frac{1}{2}$ to 1 gear.

B. MARIANS.

Will Hill-climbs Survive?

[5916].—I answer your question in the negative if we are to see motor cycles being taken to and from the hill on a car as was the case with a certain make of $3\frac{1}{2}$ h.p. machine at the Coventry Club's hill-climb at Newnham.

No doubt the compression is most important in the case of a hill-climb, but this sort of thing done so openly will choke any amateur from entering ere long. If those machines are incapable of keeping their best tune in a run of forty miles, then I don't want one.

OBSERVANT.

[5917].—I was much interested in your leading article in the issue of September 14th, on the subject of hill-climbing competitions and their place in sport.

In the obvious desire to obtain for the class of competition under consideration a permanent and sporting character I entirely agree. I am sorry, however, that I cannot express as much admiration for the method suggested to attain this result. If, as I understand it, you are desirous of obtaining various views as to methods which might be adopted to obtain the result desired, I would like to suggest the following:

1. That competitions for touring machines involve a slow ascent in addition to a fast ascent, the greatest difference obtaining the highest awards.

2. That an endeavour should be made to avoid having engines of widely varying capacities competing in the same class. That instead, events should be for, say, maximums of 300, 500, 600, 750, and 1,000 c.c. capacities. That all formulae

BROOKS-

In the World of Wheels there is no name with a higher reputation and—the goods that bear it invariably form part of the equipment of the Motor Cyclist who wisely discriminates in its selection.
Be it Saddle—be it Bag—the simple act of comparison between the BROOKS and the others will at once reveal the BROOKS superiority. The Motor Cyclist's edition of the BROOKS BOOK—a unique publication—gives illustrations and particulars of the BROOKS Compound-spring Saddles and the BROOKS many Tool and Touring Bags—we will send that BOOK free.

J. B. BROOKS & CO., LTD., 49, Criterion Works, Birmingham.

Samples of all BROOKS Saddles & Cycle & Motor Cycle Accessories may be seen at our London Showrooms, 11 Grape St. Shaftesbury Av. W.C.

The BROOKS Pannier Toolbag, B9719.
Size 10 x 5 x 2 1/2 in. Price 11/6.

The BROOKS Carrier Bag, B9682, with removable inside cases. Size 17 x 10 x 6 1/2 in. Price 26/-.
Reg. No. 547527.

The BROOKS Compound Spring Saddle, B104. Prices: plain top 22/-; padded top 29/-. (Made in enamel finish only.)

W.H.W.

N.S.U. 3h.p. Twin

**"The happy medium"
—a mount to be proud of.**

The 3h.p. Twin N.S.U. is neither too light nor too heavy, but is comfortably manageable, and develops enough power to climb the worst hills without labouring.

It is one of the very finest N.S.U. productions, and that is saying a good deal for it. Strongly constructed, highly finished, and equipped with every advantage it is constituted for a long and thoroughly satisfactory career.

The fine system of suspension and springing carried out in this model practically neutralizes vibration—hence comfort to the rider and longer life to the machine. Make a point of seeing this N.S.U. and write for our Free Catalogue.

Specification of 3h.p. Twin-Cylinder N.S.U.

Twin-cylinder engine, 496 C.C.M., 58 x 75 mm., M.O.I.V., gear driven, H.T. Bosch magneto, new pattern carburettor, drive by 1/2 in. V Belt, spring frame, new type spring forks, new type petrol and oil tanks, divided mudguards, automatic spring stand, two brakes, 26 in. wheels fitted with 2 in. tyres, engine clearance 6 in., gear ratio 6-1. Delivered as standard with under-geared pulley of improved design.

Other Models:—3 1/2 h.p. single-cylinder Model de Luxe
5 h.p. Twin-cylinder. THE sidecar machine.

A. J. W.

should be abolished, and the handicapping should be on weight alone.

5. That in handicaps prizes for fastest time be avoided.

An analysis of the above suggestions affords the following reasons:

In the touring class the engine would have to comply more nearly with the ordinary touring types of engines, and the clubman who does not own a purely racing machine would be provided with a contest in which he would have an equal chance of obtaining wins with the trade rider.

If each class is kept to itself as regards engine capacity a sporting competition will be provided possessing undetracted interest for each event.

The handicapping by weight has been amply justified with its permanent association with horse-racing, and the actual effect of weight on speed can be easily determined by quite a simple experiment and standardised by the ruling body.

As regards the second suggestion for the purely speed contests, I take it that there is no desire on the part of the trade or the public to make an infinite variety of sizes for engines over and above such a definite scale, as is suggested above, and which conforms broadly to existing commercial practice.

At this point, I would like to suggest that a great deal of unnecessary importance is attached to the so-called "factory timing." Speaking for myself, I do not know anything that a trade rider does in regard to the improvement of his engine for speed and hill-climbing that could not be equally well done by an owner. I take it that the essential difference between the engine used by the trade rider and the ordinary amateur is that the former uses an engine with camming and compression ratios adapted for racing purposes. The amateur, if sufficiently enthusiastic, and, of course, wealthy, can provide himself with the same type of machine, and, further, if the competition partakes of the nature of a race, in any shape or form, it is, of course, impossible to expect to win on a machine intended for other purposes. The racing cyclist is not expected to ride a bicycle with gear case, mudguards, and the equipment of a touring bicycle, and the same analogy must with ever increasing force apply to motor cycle competitions.

I have no doubt that many other suggestions will be forthcoming, and I would add that I sincerely hope there will be a resulting movement that will add materially to what is undoubtedly a form of competition that possesses unique and sporting qualities which can be used with distinct advantage both for the users and makers of motor cycles.

FRANK E. BAKER.

Chain Adjustment.

[5917].—We note in your "Queries and Replies" one of your readers asking if it is safe to run his chain with a considerable amount of sag, and in your reply you advise that the ideal adjustment is to set it so that there is no appreciable tightness, and yet it links up so that it imposes no strain upon the bearings.

We fully endorse your reply, and would impress upon your readers to keep their chains tight and not allow them to get too slack, as this is a frequent cause of broken rollers.

In the case of roller chains running at high speed, roller breakage is mainly the result of two causes—(1) the chain being slack and so allowing sudden shock on the rollers at each explosion of the engine; (2) insufficient lubrication. Careful attention to these two points will ensure satisfactory working of the chain under the very arduous conditions present in the high speed drive between motor and counter-shaft.

A convenient method of lubricating this chain is by arranging for the crank chamber air release valve to discharge on to the chain, thereby ensuring a plentiful supply of oil. This ensures the rollers turning freely on their bushes, and reduces the shock of impact on engagement with the wheel as the oil film deadens the blow.

For HANS RENOLD LTD.,
D. H. SIMPSON.

The End-to-end Record.

[5918].—As an amateur motor cyclist, I have been especially interested in the several articles and letters which have recently appeared in *The Motor Cycle* concerning official trials and tests?

As no doubt you are already aware I recently attempted to lower the existing lightweight End-to-end record, and although unsuccessful, I have every confidence in the machine (2½ h.p. Enfield) and in myself as to the ultimate result of a further trial.

Without wishing to find an excuse at the expense of the professional riders, I do maintain that the machines they ride are, not really "standard" machines, and, furthermore, their hair-raising speeds and freak performances during competitions are not furthering the sale of the respective manufacturers interested.

The average buyer of a motor cycle does not take sufficient interest in these professional tests to be guided by their results; if he did, then I am sure he would never be able to decide which of the manufacturers really held the advantage.

One thing is patent to everyone, and that is no two drivers drive alike; where one man would fail another would be successful, even though the same machine were used, and both riders supposed experts.

Many men whom I know are quite prepared to buy a motor

C. W. Allen, holder of the 1,000 and 2,000 miles walking records. He has recently taken to motor cycling and purchased an Enfield.

cycle, but will not simply because they honestly believe that it requires an engineer to manage it, and when asked their reason for so thinking they quickly answer, "Well, look at such and such firm, they are bound to get one of their mechanics to ride in these competitions; if their machines are so reliable, why employ men whose daily work is fitting these very machines together?" We have more than sufficient speed, what we private owners require above all is reliability and cheapness; we want a machine which will take us for reasonable distances without trouble of a mechanical nature, and above all we want cheapness, but not shoddy.

Whether the A.C.U. ban me from its competitions (should I ever choose to enter) will not worry me so long as the machine I ride carries me at my limit and my formula.

Apologising for taking up so much of your valuable space,

CHARLES W. ALLEN.

SCORCHING.—We withhold a letter received from Mr. Hugh Gibson on this subject on account of the personalities it contains.—ED.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Some Accessories.

I desire to return thanks for a batch of samples, which include a new adjustment valve for the Best and Lloyd drip-feed oil pump, enabling a complete charge to be pushed straight into the engine without disturbing the drip adjustment; this is achieved by a simple bypass, and was suggested by a criticism of mine some months ago. I naturally regard it as a great improvement. I have also received a Kingston carbon remover brush (sold by A. H. Walker, 32, Vane Street, Spring Bank, Hull). It consists of a most formidable brush armed with stiff metal bristles; the head is 3in. in diameter, and the squared shank can be mounted in a brace for rotation, if desired; it greatly assists the process of removing carbon deposits from a cylinder head, though a little preliminary chipping is still advisable when the deposits are extra hard. Mr. Surridge has also sent me a selection of his famous Holdtite patches, which possess the advantage that the edges do not curl.

Second-hand Machines.

Now is the season for the would-be rider with a shallow pocket to pick up a 1911 mount in practically new condition at wholesale price or less. Thousands of men purchase new machines every spring, and the majority of them do no winter riding, and are open to unload their 1911 machines in the months of September or October. It is ridiculous to suppose that a first-class 1911 machine is any the worse for 3,000 miles riding in the hands of a careful owner. The plating will be a trifle dimmed, and the enamel barked here and there, but what do such surface blemishes matter? The canny buyer with from £30 to £40 to invest may discover many real bargains at this period of the year.

The Flexibility Hill-climb.

I am surprised that so few clubs have listed flexibility hill-climbs on their competition programmes this year, for few events are so calculated to test the technical skill of the owners, or to bring out the genuine roadworthiness of the machines. Several clubs have held members' events of the kind, but I think no big club has organised an open climb on these lines. The usual plan is to hold two separate classes. In one, nothing is allowed in the way of attention or adjustment to the machines between the fast and slow climbs; in the other, riders are permitted to spend, say, half an hour altering their adjustments. As a rule the use of variable gears and free engine clutches is barred, for to throw such fittings in would create a third class. The slow climbs take time, but it is possible (and very sporting) to send the riders up in three for the slow climb. Very close observation is, of course, essential for the fast class. I wish one of the crack clubs, such as the M.C.C. or the Coventry, would organise a big open climb confined to these skilled riding tests for next year, with perhaps the addition of a restarting class. It would provide a far more interesting and instructive afternoon than the average devil-take-the-hindmost sprint.

A False Paradise in the Lamp World.

For several years past I have remained faithful to a very antique head lamp indeed. I bought it in 1907, and found that it gave a very satisfactory illumination, and did not fall to pieces. I fancy that one new hinge wire and one new glass represent all the replacements it has needed in four years, while the two small and cheap German generators I fed with have proved equally reliable. Early this year my old lamp came to an untimely end in a small spill, and I conquered my Scotch thriftiness sufficiently to invest the price of three belts in one of the enormous modern head lamps, of which I have heard such golden encomiums from men who ought to know. I must admit that my new investment is perfect from several points of view. Nothing about it ever breaks or vibrates loose, and its colossal generator provides good gas for four or five hours. Its one fault is that it does not give any light. The alleged long-distance beams, of which the catalogue boasts so proudly, are non-existent. The short-distance light is good enough both in intensity and in range, but is disfigured by a jumping black shadow. Regarded as a whole, the lamp is distinctly inferior to my ancient purchase. It weighs twice as much, costs three times as much, is no more reliable, and does not give half so good a light, which is not exactly as it should be.

The C.A.P. Carburetter.

I am busy testing a sample of Mr. Harold Cox's carburetter, the new C.A.P., and while up to the present it seems to me as efficient as any other I have tried, it possesses another merit which should enable it to "make good." Readers may remember that two years ago I asserted that the average ultra-sensitive vaporiser of to-day does not suit the un-mechanical type of rider; he resents the need to be constantly twiddling at his air lever, and mismanagement of this delicate item causes him frequently to fail upon hills of which a cleverer jockey could make clean ascents. Consciously or unconsciously, this type of rider bankers after the "single lever" control which helped to make the early Quadrant machines so popular. Now one of the peculiarities of the C.A.P. carburetter is that in driving there are only two positions of the air lever. You open it one-third of its travel to start, and as soon as you are in the saddle you fling it as wide open as it will go, and leave it wide open till your next stoppage. This is just exactly what thousands of inexpert amateurs want; and if the new vaporiser simultaneously affords reasonable efficiency and reasonable economy, as I have no cause to doubt it does, it should very distinctly fill the bill. One of our contributors showed the other week that a sensitive type of carburetter could be automatised by a special adjustment; but unless a carburetter is specially designed for single lever control, this special adjustment leads to heavy petrol consumption, heating of the engine, carbonisation of the cylinder, and pitting of the valves.

Variable Gears and Motor Cycles.

II.—CLUTCHES.

BY variable gears I mean the power of varying, from the saddle and while the machine is in motion, the ratio of engine to road speed, and these can be divided first into two main divisions:

1. Clutches and friction devices.
2. Variable gears (properly so-called).

1. Clutches are not variable gears in the true sense of the term, but, as they answer my requirement of altering the ratio of engine to road speed, they come within the scope of this article, and must be included; and they admit of any ratio between ∞ to 1 and the full gear.

If a petrol or internal combustion engine were flexible, like a steam

TYPES OF MULTIPLE PLATE CLUTCHES FOR ENGINE SHAFT, COUNTERSHAFT, AND BACK HUB.

(1) The Rudge engine shaft clutch.

engine is, and capable of exerting its full power at low speeds, clutches would be ruled out of court at once as variable gears, and would be of use only for starting purposes.

The Conservation of Energy.

As a matter of fact, some such friction device was tried on pedal cycles some years ago, but was, of course, useless; as the inventor would have known had he known anything about the "conservation of energy." All the force put into it that was not used to propel the machine was, of course, wasted as heat energy.

Now with a motor cycle the case is different, not because there is no loss of energy in heat—for that must of necessity take place in spite of the improvement of clutches—but because a slipping clutch enables an engine to keep up its normal speed of, say, 1,500 revolutions per minute; and, although some of its power is dissipated as heat energy, yet more arrives at the road wheel than if the engine were allowed to slow down with constantly diminishing horse-power.

If this were not the case a clutch would be useless also for starting purposes.

In support of my contention, I can refer to a letter in *The Motor Cycle*, the writer of which stated that he could slip the clutch of his Indian almost indefinitely in traffic, and use it as a variable gear.

When a Clutch is an Advantage.

Another point is that slipping a clutch takes a large amount of the load off the engine in proportion to its speed, and that consequently there is less overheating, which is largely due to overloading, and the engine can be run light with plenty of air and the throttle partly closed. (Has no one noticed that, when one has to dismount on a hill owing to belt slip, the engine seems capable of anything?) This will often enable the last bit of a bad hill to be surmounted, which would otherwise call for l.p.a. or a dismount, especially when a sidecar is fitted. It is not, however, suggested that a clutch should be slipped more than is necessary.

Belt tension when operated from the saddle can be made to answer the same purpose as a clutch to some extent. This method is found on the Motosacoche (worked by means of a jockey pulley), on the Midget Bicar (on this machine the back wheel is made to slide backwards or forwards by pressure on the footrests, but it can be firmly locked in any position), on the N.S.U. and Wanderer lightweights (operated by undergeared pulley capable of describing an arc around the crank axle. This system was also found on the F.N. lightweights a few years back).

Notes on Existing Clutches.

Excellent clutches are found on the Triumph, Premier, Singer, Indian, etc., and all two-speed machines, and for traffic riding these clutches are every bit as good as a two-speed gear, if not better, though they have not the same advantages in hill-climbing.

Like variable gears, clutches can be placed in any of the three positions mentioned previously. The Mabon and Albion clutches can be supplied to fit the crankshaft of any existing machine. The Indian and A.J.S. clutches are on the counter-shaft. The T.A.C. is in connection with the flywheel, as is usual in car practice; so also is the F.N. lightweight clutch.

The clutches found on motor cycles are for the most part of the multiple plate pattern, others are made with raybestos, leather cones, and cork insets, all of which are very satisfactory.

The Triumph hub plate clutch.

1912 MODELS.

Some Advance Details and Illustrations showing the trend of Design.

Gradior.

A new machine for the 1912 market is the Gradior, the production of the Gradior Machine Co., Stafford. This machine derives its power from a $3\frac{1}{2}$ h.p. J.A.P. engine, and has a plate clutch on the engine-shaft operated from the handle-bar by Bowden wire. Transmission is by Renold chains, the front adjuster being under the engine. One of the features on the Gradior is the two-speed gear box giving ratios of 9 and 5 to 1. This is on the car principle with a dog clutch operated by a lever on the right-hand side of the tank. The idle gears run on ball bearings, and the drivers on chilled bronze bearings. The seat pillar, as will be noticed, is supported on an A.S.L. air spring.

A new model, the $3\frac{1}{2}$ h.p. two-speed chain-driven Gradior.

incorporating an eccentric pedal chain adjustment with a very simple locking action, and also a neat device whereby

refinement which is worthy of notice is that the carrier is brazed into one piece, and is attached by pins to special lugs on the frame, there being no clips of any sort in the construction.

Altogether the cycle has been thoroughly well thought out, and from a short spin in the sidecar in thick traffic, we were convinced of the hill-climbing and braking powers and general handiness of the machine as a passenger mount.

A New Arno.

The Arno Co. will market a new T.T. model for 1912. They will retain their already well-known power unit, in which the engine, magneto, carburetter, and footrests can be detached by removing three bolts and uncoupling the petrol

Arno special design of one-piece steering head and saddle pillar lugs.

 $3\frac{1}{2}$ h.p. Sidecar New Hudson.

The New Hudson Company have decided to market a $3\frac{1}{2}$ h.p. bicycle specially suitable for sidecar work.

At first sight the new model does not appear to differ greatly from this year's $3\frac{1}{2}$ h.p. type, but on examination one sees that the machine has been greatly strengthened in many parts, so as to withstand the severe strains imposed by passenger attachments.

The frame tubes and handle-bars are of large diameter, the spokes of heavier gauge and the rear wheel is fitted with the new sidecar model, Armstrong three-speed and clutch, the latter containing double the original number of plates. This clutch is now actuated through a simple form of compound leverage which enables one to de-clutch with quite a light pressure of the foot.

New Hudson bottom bracket, showing eccentric chain adjustment and friction clutch to prevent pedal cranks revolving.

Much attention has been paid to details, and one finds many of those small refinements which are so important in the manufacture of the ideal machine. For instance, by slacking one nut and turning a milled washer, the angle of the clutch pedal may be set to suit individual requirements. The bottom bracket also is a particularly neat piece of work,

the pedals are prevented from revolving when not in use by a small friction clutch actuated by a light enclosed spring.

The brake pedal is mounted on a special lug and is quite independent of the foot-

Eccentric pin for adjusting foot-brake shoe on the New Hudson.

rests, while the shoe itself is carried on an eccentric pin which passes through a lug brazed to the frame. By rotating this pin the shoe can be set nearer or further from the brake rim, thus obviating the undue wear on one corner of the shoe, which is so frequently found even on modern motor cycles. One other small

union. The chief alterations will be in the frame. The head lugs are cast in one piece, and the rear lug is of novel and neat appearance, as will be seen from the illustrations. This also is cast in one piece, and is designed to give great strength at the joints and a low saddle position.

The standard tourist machine will resemble the T.T. type in all respects, except that it will have a slightly longer frame, and can be fitted with pedals. The size of the engine will remain the same, viz., 84×89 mm. The firm will retain their medium weight machine, and will also list a new lightweight model of 65 bore and 68-stroke, rated at $2\frac{1}{2}$ h.p. We hope to give further details of this type in an early issue.

A new model T.T. Arno with dropped top tube.

1912 Models.—

Rover.

The Rover motor bicycle for 1912 will be very little changed in outward appearance from the current year's model. Minor improvements are being made, but these alterations apply to the detail work only. The wheelbase will, however be shortened, and a consequent reduction in the weight will result. A sidecar combination is also on the tapis for next year.

The Bosch Magneto for 1912.

If there is one part of a motor cycle which goes wrong less than any other it is certainly the magneto, and hence it is

The 1912 pattern Bosch magneto with enclosed high tension terminal.

a somewhat difficult thing to see how, having arrived at its present high stage of reliability and efficiency, it can be improved. In spite of this, the 1912 type of Bosch magneto is certainly an advance, both in design and construction, on any machine that has yet appeared, and we have no doubt that motor cyclists will appreciate the practical and well-thought out improvements it contains.

The first and most obvious one is clear from our sketch, from which it will be seen that the whole of the magneto is now entirely enclosed: at the driving end by a separate detachable under-plate, and at the contact breaker end by an extension to the existing plate. The

The new Bosch high tension terminal and its casing.

whole of the base and under-plates is of aluminium alloy, and as a result the weight of the machine has been increased only a negligible amount. The advantages, however, are by no means small, inasmuch as any separate water and dust-proof cover for the magneto is now rendered entirely unnecessary.

On the edges of the aluminium plates are sunk fillets of felt which make an

almost gas-tight joint between the plates and the edges of the magnets.

The attachment of the high-tension cable, which has hitherto proved a rather weak point where bad weather was concerned, is in the new machine carried out in a most ingenious way, which entirely overcomes the likelihood of any such troubles arising. The upper extension of the driving end cover plate carries, as shown in the drawing, a vulcanite bush through the hole in the centre of which the high-tension cable is thrust into a tubular extension of the vulcanite high-tension collector brush housing. The latter, together with the cover-plate to which it is fixed, is shown in more detail in the second sketch.

The high-tension cable is attached in a very simple yet thoroughly effective manner. When it is home in its tube, it is simply transixed with the set screw as shown. The terminal joint is thus rendered perfectly water-tight, as the cable makes a fairly tight fit with the holes of the bush through which it is thrust. The only external terminal is that for the earthing wire of the contact breaker, and in this case consists of a very neat vulcanite headed binding screw.

New design Quadrant silencer in which the outlet valve B is controlled by a light spring. A is the expansion chamber and C the engine plates.

which screws down into the vulcanite bush, in the side of which is cut a slot for the earthing wire to pass through. When once screwed down there is no possibility of the wire coming loose.

It is not often that practical improvement in motor cycle mechanism is accomplished by an enhancement in outward appearance, but in the case of the 1912 Bosch magneto this is certainly the case, as the cast aluminium cover-plates on each end give it a neat, workmanlike, thoroughly finished appearance, which is a desirable attribute to any machine.

The Pilot Spring Fork.

The Pilot spring fork, made by the Pilot Cycle and Motor Co., Soho Road and Farm St., Birmingham, which we illustrate herewith, is of very neat appearance. The forks slide through round tubes on either side of the head, and while the fork is able to give to road shocks the friction of the tubes prevents bouncing and oscillation. Another point is that in the unlikely event of a spring breaking the head cannot come into contact with the mud-guard or wheel. The fork should be very suitable for sidecar work where great strength is required. The firm is prepared to grant licences to manufacturers on favourable terms.

Two-speed Singer Lightweight.

The two-speed 3½ h.p. bicycle which we recently described will be one of the leading Singer machines in 1912. The company has now decided to apply its counter-shaft gear to the 2½ h.p. lightweight model which has recently had such a remarkable run of successes. This smart little machine will also be supplied with the Armstrong three-speed gear, if desired in its original form with a single gear.

Quadrant

The Quadrant Co. will list four models for 1912—a clutch, three-speed, racing, and lady's model. In the first two cases, except, of course, for the rear hub, the machines will be identical, and will have a modification of this year's engine. The radiating fins have been removed from the inlet port and an improved adjustable pulley has been fitted.

The new racing type is fitted with an engine of 87 bore x 80 stroke, and the lady's machine, which we hope to illustrate shortly, will have an engine of 70 x 76 mm.

A very interesting silencer, illustrated on this page, is fitted to the 1912 Quadrants. It consists of a plain expan-

New model three-speed Quadrant.

1912 Models.—

sion chamber the exit from which is through a valve kept on its seat by a light spring. It is claimed that the action of this valve causes a partial vacuum in the expansion chamber after each explosion, thereby increasing the speed and power of the engine considerably.

The Norton in 1912.

We recently had the pleasure of a chat with Mr. Norton on the subject of his 1912 models. He told us that he would make no great changes in his present types, but that owing to prolonged experiments with air cooling there will be a considerable increase of efficiency in the 1912 machines. He also told us that he would list a novel type of miniature machine. The engine, which is rated at $2\frac{1}{2}$ h.p., is of the long stroke type with mechanically operated valves, placed one above the other. The cylinder is inclined with the ribs arranged so as to be parallel with the ground. The weight of the complete power unit, comprising engine, magneto carburetter, exhaust pipe, and engine clips, is stated to be only 28½ lbs.

A New F.N. Clutch.

The F.N. Motor Agency have just placed on the market a well designed and well made plate clutch, which may be easily fitted to all ancient and modern four-cylinder F.N. motor bicycles. The illustration accompanying this notice shows the clutch in pieces, and it will be seen that in design it follows standard practice. The whole device takes the place of the usual flywheel, A being the new flywheel which contains most of the mechanism, B is the ball thrust bearing and spring, and C is the small plate carrier connected to the driving mechanism E. The external ring D carries the larger plates and is screwed on to the flywheel. E is the driving and operating mechanism on which is attached the main driving pinion in the transmission, while the arm is for the attachment of a bowden wire which operates the clutch from the handlebar by means of the quick pitch screw to be seen clearly on E.

Sidecar Combinations.

Passenger enthusiasts are to be well catered for next year. Among the new firms who have variably-gearred motor cycle and sidecar combinations in course of manufacture for 1912 are: Rover, Enfield, James, Premier, Douglas, and New Hudson. In these machines the lugs for the sidecar fittings will be, in most cases, brazed to the frame.

A Two-speed James.

The 1912 James motor cycles will retain the same sized engines, that is to say, 86 bore by 96 stroke, but the combustion chamber and valve ports have been re-designed, and the diameter of the exhaust pipe increased, with beneficial results. The magneto also has been slightly raised to give greater belt clearance. The frame will remain the same, but with the addition of a front wheel stand, a neat spring fork on Druid lines with scimitar blade side members, and a carrier specially designed to allow of the saddle being in the lowest possible position, and to carry special pannier tool-bags.

A special model will be made for sidecar work, in which the sidecar attachment lugs will be built into the frame. The firm will also supply their own sidecar chassis to which any body may be fitted.

Interior mechanism of the James two-speed counter-shaft gear.

- A. Friction pads.
- B. Phosphor bronze bush.
- C. Sliding dog clutch engaging one or other of the gears.

The chief feature of this new model is a neatly designed two-speed gear box, combined with a composition lined cone clutch. The power is transmitted from engine to gear box by means of a short chain, the rear sprocket being mounted with a frictional device to prevent harshness in the drive. Thence it passes either directly (for the high gear) or through a geared counter-shaft for the low to a second sprocket mounted loosely on the outside of the primary gearshaft, thence to the rear wheel by a second chain. Both gearshafts are mounted on ball bearings, and the change of gear is effected by a lever attached to the top

tube in a convenient position. This lever works in a horizontal plane and actuates the usual type of dog clutch in the gear box. At present the gear box is situated just behind the saddle-pillar, but in

The James two-speed counter-shaft gear. The rocking gear-lever is controlled from a quadrant on the top tube.

future it may take the place of the bottom bracket. We have been promised a run on this machine at an early date, and hope shortly to give our impressions of it on the road.

The Enfield Autorette.

The Enfield Autocar Co. are placing a new three-wheeled sociable on the market for 1912, with a single driving wheel. It is named the "Autorette," and will be driven by an 8 h.p. water-cooled V-type twin engine. The frame will be of pressed steel, and the transmission through chain and a two-speed epicyclic gear in the back hub.

A Mechanical Petrol Pipe Joint.

The small fitment illustrated herewith has been patented by Mr. W. Starley, 11, St. Paul's Road, Coventry, and provides for a mechanical joint without any solder. The illustrations show that the

Elimination of soldered joints.

copper pipe is belled at the end, and in the bell mouth a conical junction piece is fitted, the usual coned end is provided on this piece for connecting to the body of the tap. When the union nut is screwed up it locks the belled end of the pipe against the junction piece and the tap. We understand that the joint is perfectly petrol and oil-tight, and that one or two manufacturers are prepared to fit it.

The new pattern F.N. multiple-plate clutch dissected to show the working parts.

Seventh 1911 Monthly Meeting of the B.M.C.R.C.

INTERESTING RACING. SEVERAL RECORDS BROKEN.

There was a much improved attendance at the B.M.C.R.C. meeting at Brooklands last Saturday.

THE weather was cool, and early in the afternoon the attendance was poor, but later on quite a number of spectators arrived. The meeting was confined to two long distance events, first the Junior Hour Race, which started twenty-five minutes behind time, and then the 100 Miles Record Race, which took well over two hours.

The Junior Hour Race for Classes A 275 c.c. and B 350 c.c., was started by Major Lloyd. All got away in good form except Woodman, who had some trouble in getting his Humber to fire, but once started the machine travelled well. The order at the end of the first lap was, Colver, Martin, Wright, Weatherilt, Barnes, Wilberforce, and Slatter. This was

Barnes's first and last appearance, as a seized tappet rocker caused his retirement. Weatherilt now assumed the lead, and kept his position for eight consecutive laps. Then a sooted plug put him a lap behind. At half-time the order was Martin Weatherilt, Wright, Colver, Woodman, and Slatter. Wilberforce withdrew owing to a broken petrol pipe in the third lap, while Slatter had stops for a broken oil pipe. In the twelfth lap Wright took second place and Weatherilt dropped back into third place. The position did not change till the last lap but two, when Weatherilt began to force the pace and got into second place again. The results are given overleaf:

Start of the 100 Miles Race, in which J. R. Haswell (Triumph) beat J. Marshall's record of last year also on a Triumph.

Mr. T. W. Loughborough distributes the coloured sashes which denote the various classes. He is seen above helping Gordon Bell to pin his sash on, whilst H. A. Collier has been successful with his.

CLASS A.—Record.

	Mls.	yds.
1. H. Martin (1 Martin-Jap) 76×60 mm., 272 c.c.	54	310
Martin used accumulator and coil ignition.		
2. N. D. Slatter (1 Alcyon) 62×82, 247 ...	10	laps

CLASS B.

1. H. Martin (1 Martin-Jap) 76×60 mm., 272 c.c.	54	310
2. P. Weatherilt (1 Zenith-Gradua-Jap), 76×65.5, 299 ...	51	796
S. Wright (2 Humber), 60×60, 340 ...	18½	laps
H. V. Colver (2 Enfield) 54×75, 338 ...	17½	laps
A. Woodman (2 Humber), 60×60, 340 ...	14	laps

Martin's performance, in which he captured the record in Class A and won in Class B, is one of which he may be justly proud. Class B record is held by O. C. Godfrey (Zenith-Gradua)—one hour, 54 miles 726 yards.

The next and last event of this the last meeting of the year was the 100 Miles Record Race for Classes C, D, and E (not exceeding 500, 750, and 1,000 c.c.). The entry for this race was quite good. C. R. Collier did not after all ride his 499 c.c. Matchless, but chose to mount his red chain-driven record breaker, while H. A. Collier rode a similar belt-driven machine. Both brothers used oil pipes conducting the lubri-

Three competitors in the Junior Race. Left: H. Martin (Martin-Jap), who beat record, V. Wilberforce (N.L.G.), and N. D. Slatter (Alcyon).

cant directly to the front cylinder. McNab was mounted on a new 3½ h.p. Trump-Jap, conspicuous for its sensible filler caps and excellent finish. H.H. ignition (coil and dry battery) was fitted, and a C.A.P. carburetter. McNab is most enthusiastic about the latter accessory. There was an impressive start, and then began the long tedious event. C. R. Collier at the end of the first lap was leading by streets, and, according to Major Lloyd's timing, covered the first lap from a standing start in 2m. 22½s. H. A. Collier came next, and then there followed Luce, Spencer, Tessier, Haswell, Elce, Rhys, Harrison-Watson, Godfrey, Martin, McNab, Quintin Smith, Howard Smith, Oldman, Stewart, Guiver, Ware, and C. W. Smith.

A Race full of Incidents.

The race was full of incidents. C. R. Collier let his brother go ahead in the fourth lap, but only on this occasion, then H. A. Collier stopped. After twelve laps C. R. Collier was visibly losing ground, and eventually he had to retire through a seized front piston. Later on his brother retired. Lieut. Stewart, the well-known Trump-Jap exponent, was early in trouble. Just after the race had started he attempted to tighten a plug on his carburetter with a spanner while travelling at about 50 m.p.h.; the spanner somehow tried conclusions with the spokes of the wheel, and Stewart's recollections of what happened afterwards are by no means clear. Fortunately he was thrown on the grass. At about fifteen-laps Haswell looked like distinguishing himself. H. A. Collier was leading, his brother was on the point of giving up, and Haswell was running second. Elce

The Rudge contingent in the 100 Miles Race. W. H. Elce, second from left, finished only 25 secs. behind J. R. Haswell.

then led the field, Haswell was second, and the race developed into a Rudge and Triumph duel, resulting in Haswell finishing first on a flat tyre. Elce stopped to change his belt, which was getting oily, and as events proved lost the race thereby. Result: H. M. S.

1. J. R. Haswell, Class C. (1 Triumph), 85×88 mm., 499 c.c.	1	37	52½
being 100 mls record, and beating the performance of J. Marshall, who on a 3½ h.p. Triumph on June 22nd, 1910, covered the distance in 1h. 50m. 22s. In the hour Haswell covered 62 miles 1,169 yards. He used Dunlop tyres, Lyso belt, Bosch ignition and plug, Shell petrol, and Price's oil.			
2. W. H. Elce, C. (1 Rudge), 85×88, 499 ...	1	38	174
3. O. C. Godfrey, C. (1 Indian), 82.5×83, 497 ...	1	42	40
4. S. T. Tessier, D. (2 Bat-Jap), 85×65, 728 ...	1	46	30
5. S. Spencer, C. (1 Rudge), 85×88, 499 ...	1	59	25½
6. E. B. Ware, C. (1 Rudge), 85×88, 499 ...	2	5	18
W. T. L. Rhys, C. (1 Rudge), 85×88, 499 ...	34	laps.	
F. A. McNab, C. (1 Trump-Jap), 90×77.5, 482 ...	33	laps.	
W. F. Guiver, C. (1 Kerry), 85×88, 499 ...	23	laps.	
W. Oldman, C. (1 Zenith-Jap), 85.5×85, 488 ...	18	laps.	
H. Smith, C. (1 Triumph), 85×88, 499 ...	11	laps.	
R. N. Stewart, C. (1 Trump-Jap), 90×77.5, 492 ...	2	laps.	
J. Smith, C. (1 Triumph), 85×88, 499 ...	8	laps.	
J. Harrison-Watson, C. (1 Triumph), 85×88, 499 ...	5	laps.	
H. A. Collier, E. (2 Matchless-Jap) 90×77.5, 997 ...	24	laps.	
C. R. Collier, E. (2 Matchless-Jap), 90×77.5, 997 ...	12	laps.	

A VARIABLE COMPRESSION DEVICE.

Messrs. Packer, and Prentis, engineers, Roden Street, Ilford, have added another ingenious device to those recently dealt with in our pages. This consists of a chamber G screwed in the place of the valve cap over the exhaust valve of the machine. Inside the chamber are two valves E and I on a common spindle, which spindle is operated by means of an eccentric C attached to the spindle B and the lever A. When it is required to reduce the compression the handle is pulled up, with the result that the valve E is closed and the valve I is left open, so that the compression is reduced by the amount of the area of the space F. The

ing pace by dropping the valve. As this device can be fitted to any existing machine it should prove a boon to those who find their motor cycles difficult to start.

use of this device is obvious, and with the machine on which it was demonstrated to us the other day (an old $3\frac{1}{2}$ h.p. Brown with sidecar fitted), it is possible to start at a walk-

O. C. Godfrey (single cylinder Indian, in his up-to-date racing attire, which he wore at the B.M.C.R.C. meeting last Saturday.

MOTOR CYCLE HILL-CLIMBING IN SOUTH WALES.

A MOST successful competition took place at Ewenny, near Cowbridge, on September 20th, before a large company. Unfortunately, the weather conditions were not favourable for hill-climbing, a heavy thunderstorm falling just before starting. The meeting was arranged by Mr. A. S. Evans, The Bridge Garage, Cowbridge, who provided the prizes and entertained the competitors to supper in the evening. Great credit is due to him for his enterprise in providing a splendid afternoon's sport. Col. Homfray (Ruthin Castle) and Mr. Thurston Bassett kindly acted as judges. Mr. J. Thomas (Canton) gave his services as starter and handicapper. The events were run in heats. The results are as follow:

2 H.P. LIGHTWEIGHT CLASS.

1, C. Davis (2 h.p. Humber); 2, Wybert Thomas (2 h.p. Humber).

2 $\frac{3}{4}$ H.P. TWINS.

Dr. Templeton (2 $\frac{3}{4}$ h.p. two-speed Enfield) and H. Homfray (2 $\frac{3}{4}$ h.p. Enfield), dead heat. In the run off Dr. Templeton beat H. Homfray by a length

3 $\frac{1}{2}$ H.P. SINGLE-CYLINDER CLASS (Gold medal given by the Triumph Cycle Co.)

Hayton (T.T. Triumph) beat Bird (3 $\frac{1}{2}$ h.p. Triumph).

OPEN HANDICAP.

First Round.—D. J. Evans (2 $\frac{3}{4}$ h.p. two-speed Enfield) beat Jones (3 $\frac{1}{2}$ h.p. Rudge); A. S. Evans (2 $\frac{3}{4}$ h.p. Enfield) and H. Homfray (2 $\frac{3}{4}$ h.p. Enfield) dead heat; J. Croome (3 $\frac{1}{2}$ h.p. Premier) beat Bird (3 $\frac{1}{2}$ h.p. Triumph); Wybert Thomas (2 h.p. Humber) beat F. Sanders (3 $\frac{1}{2}$ h.p. Triumph); C. Davies (2 h.p. Humber) beat Richards (3 $\frac{1}{2}$ h.p. B.S.A.); Staine (3 $\frac{1}{2}$ h.p. James) beat E. W. Davies (3 $\frac{1}{2}$ h.p. Premier); Dr. Templeton (2 $\frac{3}{4}$ h.p. Enfield) beat S. Hayton (T.T. Triumph).

Second Round.—H. Homfray beat Staine; A. S. Evans beat C. Davies; D. J. Evans beat J. Croome; Dr. Templeton beat Thomas.

Third Round.—H. Homfray beat A. S. Evans; Dr. Templeton beat D. J. Evans.

Final.—H. Homfray (2 $\frac{3}{4}$ h.p. Enfield) beat Dr. Templeton (2 $\frac{3}{4}$ h.p. Enfield). Won by a length.

The Motor Cycle Overseas Number will make its appearance on Thursday, October 12th.

Proposed Trial for Runabouts.

We have received several enquiries as to what has happened to the proposed reliability trial for light four wheeled quadcar type of vehicles in which the Hereford 100 guinea challenge vase was to be awarded. This event was much boomed in certain quarters a month or two ago.

Valve Troubles Disappearing.

In reading the description of Saturday's B.M.C.R.C. meeting at Brooklands one cannot help noticing the absence of continued references to valve troubles. Compare this with a report of a 100 miles race at Brooklands say twelve months ago, and the improvement in valves will at once be apparent.

Who are this year's Club Champions?

The Oxford M.C.C. are supposed to have gained the title of club champions by beating eight other teams in the A.C.U. inter-club championship. But what of the Derby and District M.C.C., which club's team of six came out on top in the M.C.C. Team Trial last June, vanquishing 120 other motor cyclists representing twenty different clubs.

Auto Cycle Union Notes.

The Auto Cycle Union has not seen fit to grant a permit to the Liverpool Auto Cycle Club to hold an open reliability trial on the 7th and 8th prox., as the ruling body has already refused permits to two clubs this year, and naturally a special exception could not be made. The Union, however, is anxious to help the Liverpool A.C.C., and has expressed its willingness to grant a special permit if the event is run off as an inter-club competition.

A.C.U. QUARTERLY TRIAL.—The route published in last week's issue has been approved by the Competitions Committee. Mr. Archibald Sharp has been appointed to act as judge in place of Mr. Cove, who resigned.

NOISY EXHAUSTS.—The Union has received a letter from a well-known chief constable complaining of the noise made by motor cyclists passing through towns and populous places. The A.C.U., which is well aware of the nuisance created by noisy machines, is endeavouring further to mitigate the source of complaint by giving more careful attention to the question of silence in future trials and competitions.

The Quarterly Trial Test Hills.

Farlow Bank, first unearthed by members of the Birmingham Motor Cycle Club about 1908, which organisation at that time offered a prize for the first ascent, is likely to be the scene of much practising between now and the next Quarterly Trial on the 14th October. For that reason, perhaps it would be wiser on the part of the A.C.U. in the future to keep all routes for reliability trials a secret. Birdlip, the second test-hill, has an excellent surface, the bends are gradual, but the gradient is very steep.

Speed Limits in West Riding of Yorks.

A ten miles an hour speed limit is now in force in the urban district of Burley-in-Wharfedale, on the main road from Skipton to Otley from its junction with Leather Bank to its junction with Station Road.

In the urban district of Ilkley, a ten miles an hour speed limit affects so much of the main road from Skipton to Otley (including Church Street and part of Leeds Road) as extends from its junction with Alexandra Crescent to a point in the road fifty yards north-east of the Infants' School.

THE ENTENTE CORDIALE CUP

Presented to the Motor Cycle Club de Lyon by the North-West London M.C.C. The cup was offered by the English club in a hill-climb on the Col de la Luere after the race for the Circuit du Rhone, and was won by the Lyon club.

Streatham and District M.C.C. Open Hill-climb.

The above event, which is down for Saturday next, has secured 120 entries. The venue of the hill will be posted in Messrs. Nye and Co.'s window, 130, Gray's Inn Road, W., to-morrow (Friday); also at the club's quarters, Crown and Sceptre, Streatham Hill, and the Craven Arms, Godstone.

A.C.U. Council Meeting.

A meeting of the Council of the Auto Cycle Union will be held at the Imperial Hotel, Birmingham, on Friday, 13th October next, at 7.30 p.m. Following the council meeting, the Midland Centre has arranged to hold a smoking concert, to which all delegates and also the competitors in the Quarterly Trial, which is to take place the following day, will be invited.

A Severe One Day Trial.

On Saturday last the Sheffield and Hallamshire M.C.C. held a 200 miles reliability trial embracing three of the Six Days' Trial test hills, viz., Wass Bank, Brownstay Ridge, and Keighley Gate. To add to the severity of the contest, rain fell heavily for eighty miles of the ride. The result will be found in our Club News pages.

A.C.U. Inter-club Championship.

Dr. Basil Fawcett writes pointing out that the A.C.U. was incorrect in announcing that he had to shed his passenger on Edge Hill in the last round of the above competition. Dr. Fawcett, as a matter of fact, made a non-stop run, and climbed the hill slowly (as required by the rules of the competition) on each circuit.

Result of an Action.

The Phelon and Moore action against James Horlick, of Cowley Manor, near Cheltenham, in which W. Pratt sought to recover £91 15s. damages, resulted in a verdict for defendant with costs. It will be remembered that the accident occurred during W. Pratt's attempt to cover 1,000 miles without using a tool, and at the 591st mile, when between Seven Springs and Allenwood, he was obliged to mount the grass to avoid a restive horse which was being "broken in" on the highway, and in so doing came into violent collision with a telegraph pole stay.

Speed Limit Application.

The Redcar Urban District Council have decided to apply to the North Riding (Yorkshire) County Council for an order to reduce the speed limit for motor cars and motor cycles within the urban district.

A Deserving Appeal.

A public testimonial has been opened at Beckenham on behalf of Sergt. Parker of that place, professor of physical culture at the Abbey School, Beckenham. Whilst driving his Douglas, Parker had the misfortune to be involved in a cross-road collision with a locally owned car, and he sustained a fractured thigh.

Awards in Herts County A.C. Kendal Tour.

We publish below the official awards in the above competition: Lightweight Cup, C. M. Down (2½ Enfield); Triumph Cup, E. A. Colliver (3½ Zenith); Indian Bowl, G. S. Carter (5 Matchless); Humber medal for passenger machine, Alan Hill (3½ Rudge); Car Cup, F. S. Carter; Kempshall tyres, A. J. Dixon (3½ Rudge); Silver Cup, P. Phillips (2½ Douglas). All the other competitors have been awarded bronze medals.

Another Broken Sidecar Axle.

A member of the motor cycle section of the Brookdale C.C., of Catford, had an unpleasant experience near Newmarket on Sunday morning. He was driving his Bradbury and another make of sidecar when the axle of the latter broke. Fortunately he was travelling slowly, and neither the lady passenger nor himself hurt. The return run to London was made with the lady on the carrier. This accident once again emphasises the necessity of a good strong axle on a rigid sidecar.

Kent Autumn Hill Tour.

H. A. Cooper, of Keston, Kent, is organising another invitation personally conducted run round some of the Kentish hills, on the same lines as the successful outing held earlier in the year when the Salt Box (Crown Ash) climb first received attention. Mr. Cooper informs a correspondent that he has already made investigations into a new hill "find" in the neighbourhood of Chalk Pit, which is an exceedingly stiff test, especially if taken "on the run." The date and place of meet for the autumn run will be duly intimated.

Another Dog Episode.

An accident befell Mr. Campbell, the architect to the Bolton Education Committee the other day while riding his Motosacoche. He is, we are glad to state (by the way of showing the utilitarian purposes of the motor cycle), in the habit of using his petrol mount in the course of his professional duties, having a large number of schools to look after spread over a big area. Returning to his offices he suddenly found himself thrown in the road through a big dog running across the street to its mistress. His left little finger was broken, his temple badly bruised, and other cuts besides shock sustained. We wonder when dogs will be kept under proper control? Some folk by a twist of good nature think a dog's freedom of greater value than the safety and life of a human being.

Autumn Open Speed Trials.

On October 21st, in a private park at Luton Hoo, near Luton, by kind permission of Sir Julius Wernher, the Herts County A.C. will hold a series of open speed trials. The course will be nearly a mile long, and is practically straight. The surface is excellent. There will be no formula, fastest time to win in each class, and a flying start will be allowed. Particulars may be obtained from Mr. C. C. Cooke, North Mimms, Hatfield. Admission to the park will be strictly by programme, which may be had for 6d. each.

The Herts County A.C. will hold a members' hill-climb on October 14th, at Aston Hill.

FUTURE EVENTS	
Sept. 30.	—Streatham and District M.C.C. Open Hill Climb.
Oct. 4.	—Brooklands October Meeting.
" 12.	—"The Motor Cycle" Overseas Number.
" 14.	—A.C.U. Quarterly Trial (Midland Centre).
" 21.	—Herts County A.C. Autumn Open Speed Trials.
Nov. 20-25.	—Motor Cycle and Cycle Exhibition at Olympia.
A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.	

3,000 Miles Engine Test.

The free engine Singer machine on which D. R. O'Donovan is attempting to cover 3,000 miles without using a tool has now covered 1,700 miles with all seals intact. The rider was to be timed over a measured mile on Tuesday; and again before the trial finishes. He estimates that his mount will do 55 m.p.h. After the conclusion of the 3,000 miles run the engine is to be dismantled in the presence of one of our staff to prove that the machine is standard.

A New Engine for the Hour Record.

That talented designer, Mr. Louis Coatalen, of Sunbeam car fame, is at present completing the design of a 3½ h.p. motor cycle engine for a leading firm of motor cycle manufacturers. The engine is of the 499 c.c. class, measuring 85 x 88 mm., and will have overhead mechanically-operated valves actuated by outside tappet rods. The cylinder head is water-cooled, and the design is chiefly conspicuous for its very large valve area. The single-cylinder hour record is the object in view, and Mr. Coatalen has strong hopes that the machine will accomplish nearly seventy miles in the hour.

Water-cooling on Motor Cycle Engines.

At least four firms will market water-cooled motor cycle engines next year. The absence of valve troubles, carbon deposits, and less liability to knocking is evidently appealing to designers.

B.A.R.C. October Meeting.

The entries for the October meeting, to be held on Wednesday, October 4th, are:

THE FOURTH LONG MOTOR CYCLE RACE.

D. C. Bolton (1 cyl. Bolton-Jap).
E. J. Bolton (1 Martin-Jap).
George Hill (1 Rudge).
O. C. Godfrey (2 Indian).
W. O. Oldmar (1 Zenith-Gradua).
S. G. Cummings (1 L.M.C.).
P. Schmidt (2 N.S.U.).
A. R. Abbott (1 Bradbury).
P. Weatherill (1 Zenith-Gradua).
H. W. Hands (1 Zenith-Gradua).
H. Martin (2 Martin).
H. Shanks, jun. (1 Kingfisher-Jap).
J. H. Slaughter (1 L.M.C.).
W. Pollard (1 Quadrant).
S. C. Winfield-Smith (1 Singer).
R. G. Mundy (1 Alcyon).
N. D. Slater (1 Alcyon).
S. T. Tessier (1 Bat).
F. E. Pither (1 Rudge).
A. C. Allen (1 Douglas).
H. A. Collier (2 Matchless).
C. R. Collier (2 Matchless).
The above race starts at 2.25 p.m.

Well-known Rider Committed for Trial.

At the Westminster Police Court, before Mr. Francis, on Wednesday last week, Jas. Merton, 24, a professional motor rider, giving an address at 46, Angel Lane, Stratford, appeared on remand to answer a charge of obtaining a motor cycle value £25 by false pretences from G. N. Higgs.

The evidence given on the last occasion was to the effect that the defendant, being anxious to obtain a motor cycle upon which to attempt to break the six days' record, approached the prosecutor with certain proposals, which he declined, and the defendant, being unable to obtain the use of a machine, finally agreed to purchase one for £25. He gave a cheque for the amount in payment drawn by

Harrogate and District M.C.C. hill-climb in pairs. J. A. Tinsall (3½ h.p. Triumph) and J. J. Day (3½ h.p. Bradbury) previous to running off for third and fourth places.

another person, which on presentation was returned marked "No account." Ultimately, defendant was committed for trial at the next Sessions, bail being allowed.

CLUB NEWS.

Walthamstow M.C.

Whilst competing in the standard ride for a silver cup Miss A. Percy, a member of the above club, succeeded in riding her $3\frac{3}{4}$ Scot. from Walthamstow to Norwich and back, 200 miles in twelve hours, including stops at checks.

Sutton Coldfield A.C.

The petrol consumption test for motor cars and motor cycles will take place on September 30th, at 2.30 p.m. Competitors will meet at the Midland Railway, Sutton Park Station, where they will be weighed in and tanks filled.

Walsall M.C.

The hill-climb on Style Cop which was held on the 17th inst., resulted as follows: Class 1, Mr. Field ($3\frac{1}{2}$ Precision), 72 $\frac{3}{4}$ s. 2, Mr. Smytheman ($3\frac{1}{2}$ L.M.C.), 52 $\frac{3}{4}$ s., fastest time of the day. 3, Mr. Smytheman ($3\frac{1}{2}$ L.M.C.), 58 $\frac{1}{4}$ s. 4, Mr. Busby (2 Humber), 101 $\frac{1}{4}$ s. 5, Mr. Walker (7-9 Indian), 60 $\frac{3}{4}$ s.

Furness M.C.C.

The above club held its first hill-climb on Birkkrigg Moor, near Ulverston, on the 2nd inst. The results on formula were: 1, J. Timmins (2 $\frac{3}{4}$ h.p. Enfield); 2, L. Bradbury (2 $\frac{3}{4}$ h.p. Douglas); 3, H. Bloxam (3 $\frac{1}{2}$ h.p. N.S.U.). Prizes were presented by Douglas Bros., Bristol. The club, which is of 1911 formation, is being affiliated to the A.C.U.

Durham and District M.C.C.

A severe reliability trial was held on September 17th. Course: Durham, Lanchester, Edmond-Byers, Stanhope, Middleton, Alston, Killhope, Wolsingham, Lanchester and Durham. The results are: J. P. Forster, 1; F. C. Wake, 2; T. Smith, 3, all riding T.T. Triumphs. Only one competitor succeeded in making a clean ascent of Softley Hill.

Pontefract M.C.C.

The annual non-stop trial for the members' trophy was run off on the 21st. The course was forty-two miles out and fifty miles home, and included Pot Bank, Norwood Edge, and Brogden Hill, each of which had to be climbed twice. There were seven starters. The results were: 1, Edw. Lee ($3\frac{3}{4}$ Scott) and Will Bentley ($3\frac{1}{2}$ F.E. Triumph), lost no mark; 3, H. Craven (7 Chater-Lea and sidecar), lost one mark.

Taunton and District M.C.C.

The above club held a seventy miles reliability trial on Thursday, the 14th inst., when gold medals presented by the president, Col. D. F. Boles, M.P., were won by the following: W. G. Potter ($3\frac{1}{2}$ h.p. P. and M.), total error 54s., non-stop; P. Clarke ($3\frac{1}{2}$ h.p. Triumph), 1m. 15s., non-stop; W. Phillips ($3\frac{1}{2}$ h.p. Triumph), 1m. 25s., non-stop; W. Goodman ($2\frac{3}{4}$ h.p. Douglas), 1m. 26s., non-stop. Messrs. T. G. Crump ($3\frac{1}{2}$ h.p. Ariel tricycle), F. Hansford (Matchless), and T. Drayton ($3\frac{1}{2}$ h.p. Triumph) finished within schedule time, but each had a stop and was disqualified. There were eleven competitors.

Sheffield and Hallamshire M.C.C.

The above club held its severest reliability trial on Saturday last. The course included three well-known hills, Wass Bank, Brownstay Ridge, and Keighley Gate, and was as follows: Sheffield, Ferry Bridge, York, Easingwold, Coxwold Bank, Wass Bank, Ripon, Pateley Bridge, Brownstay Ridge, Kirkby Malzeard, Ripon, Keighley Gate, Bradford, Wakefield, and Sheffield, a total distance of 210 miles. The severity of the course accounted for rather a small entry, but the competition for the first three places was very keen. The results are as follows: 1, Dan Bradbury ($3\frac{1}{2}$ h.p. Norton) and S. Sawyer ($3\frac{1}{2}$ h.p. Premier), lost no marks. 3, C. Bellamy ($3\frac{1}{2}$ h.p. Zenith-Gradua), lost nine marks.

North-west London M.C.C.

The above club completed a heavy season's programme on Saturday last with a speed-judging competition in which every element except pure speed estimation was eliminated. The course was laid from the thirteenth to twenty-third milestones and back on the Great North Road. Out of fourteen competitors the nearest to correct time was W. Cooper ($3\frac{1}{2}$ h.p. Bradbury and sidecar), one minute twenty seconds slow, his passenger being Mrs. Cooper, the donor of the first prize, who seemed most disappointed that her gift was to remain in the family. E. G. Westacott ($3\frac{1}{2}$ h.p. Zenith-Gradua), who organised the competition, was second one minute forty-seven seconds slow. H. B. Karslake ($3\frac{1}{2}$ h.p. Rover) finished third.

Oxton (Birkenhead) M.C.C.

The above club held a hill-climb on the 9th inst. at Thursaston, for medals presented by Mr. O. Mann Kitchen, of Heswell. The results were as follows:

Class I., for standard touring singles up to 600 c.c.—1, A. Wellgood ($3\frac{1}{2}$ h.p. Bradbury); 2, T. B. Naylor ($3\frac{1}{2}$ h.p. Rover); 3, P. Barry ($3\frac{1}{2}$ h.p. Triumph).

Class II., for any size single or twin (racing class)—1, G. Flinn ($3\frac{1}{2}$ h.p. T.T. Triumph); 2, E. Kickupp ($3\frac{1}{2}$ h.p. Rudge); 3, S. Warson ($3\frac{1}{2}$ h.p. T.T. Triumph).

Class III., for lightweights up to 340 c.c.—1, A. Kitchen, jun. ($2\frac{1}{2}$ h.p. New Hudson); 2, A. V. Latham ($2\frac{3}{4}$ h.p. Douglas); 3, H. H. Bavistock ($2\frac{1}{2}$ h.p. Motosacoche).

Class IV., for passenger machines.—1, P. C. Staytham (6 h.p. Zenith-Gradua and sidecar); 2, A. Kitchen, jun. (8 h.p. Chater-Lea and sidecar).

Essex M.C.

The results of the annual Snaresbrook to York run have now been passed and are as follows: A. V. Deacock ($3\frac{1}{2}$ h.p. N.L.G.) gold medal and the Triumph challenge cup, total error in minutes 11; G. L. Fletcher ($2\frac{3}{4}$ h.p. Douglas), gold medal and special lightweight award, a silver cigarette case, presented by the Rex Co., 13; G. T. Gray ($3\frac{1}{2}$ h.p. Rudge), gold medal, 15; H. A. Beal (3 h.p. N.S.U.), silver medal and special amateur award, a pair of Michelin covers, 20; A. T. Stanton ($3\frac{1}{2}$ h.p. Bradbury and sidecar), silver medal and special passenger award, a Lucas lamp set, 21; B. Alan Hill ($3\frac{1}{2}$ h.p. Rudge and sidecar), 21; F. W. Applebee ($3\frac{1}{2}$ h.p. N.S.U.), 21; H. Evans ($3\frac{1}{2}$ h.p. Rudge), 23; J. A. Campbell ($3\frac{1}{2}$ h.p. Rudge), 25, silver medals; J. L. Love ($3\frac{1}{2}$ h.p. Triumph), 64; C. E. Lovett ($3\frac{1}{2}$ h.p. Bat-Jap), 91; S. B. White ($3\frac{1}{2}$ h.p. Service-Jap), 108; N. C. Dear ($2\frac{3}{4}$ h.p. Douglas), 111; D. S. Kapadia (8 h.p. Minerva and sidecar), 161; C. J. Byat (6 h.p. Salway and sidecar), not checked, bronze medals.

Harrogate and District M.C.C.

The last competition of the season, a hill-climb, was held on Saturday last. Each entrant was handicapped according to merit, and the event was then run on the knock-out principle. The results are as follow:

First Round.—R. Spencer ($3\frac{1}{2}$ T.T. Triumph), 4s. start, beat F. Mackay ($3\frac{1}{2}$ T.T. Singer), 2s. J. E. Brooke ($3\frac{1}{2}$ T.T. Triumph), 4s., beat H. Fortune ($3\frac{1}{2}$ Triumph), 6s. B. Tindall ($3\frac{1}{2}$ T.T. Triumph), 4s., beat W. E. Grange ($3\frac{1}{2}$ Bradbury), 3s. C. Nettleton ($3\frac{1}{2}$ two-speed Humber), 10s., a bye. T. Atkinson ($3\frac{1}{2}$ T.T. Triumph), 2s., beat G. Sayner ($3\frac{1}{2}$ T.T. Triumph), 4s. J. Day ($3\frac{1}{2}$ two-speed Bradbury), 6s., beat G. Hill ($3\frac{3}{4}$ two-speed Scott), 8s. W. Atkinson ($3\frac{1}{2}$ T.T. Calthorpe), 5s., beat W. Hemsworth (5 two-speed Rex), 6s.

Second Round.—Spencer beat Tindall. T. Atkinson beat Day.

Final.—Spencer beat T. Atkinson.

Inter-club Hill-climb at Newnham.

The Sutton Coldfield A.C. and Oxford M.C.C. held a hill-climbing match last Saturday.

The Sutton Coldfield team proved somewhat easy winners over the Oxford team, which was composed entirely of amateurs.

SUTTON COLDFIELD A.C.

Rider and machine.	Time.	Figure of merit.
1. Dudley ($2\frac{3}{4}$ h.p. Hobart) ...	25s.	24.1
2. Woodgate ($2\frac{1}{2}$ h.p. Singer) ...	22 $\frac{1}{4}$ s.	24.7
3. Roper ($3\frac{1}{2}$ h.p. Ivy) ...	19 $\frac{3}{4}$ s.	28.3
4. Jones ($3\frac{1}{2}$ h.p. Ixion-Jap) ...	20s.	28.9
5. Clark ($3\frac{1}{2}$ h.p. Corah) ...	19 $\frac{3}{4}$ s.	31.0
6. G. Hill ($3\frac{1}{2}$ h.p. Rudge) ...	24s.	33.7

Club News.—

G. Van Vestraut (3½ h.p. Rover) starting in the Coventry and Warwickshire M.C. members' hill-climb at Saintsbury, near Broadway, last Saturday.

Coventry and Warwickshire M.C.

After the car hill-climb at Saintsbury, near Broadway, Worcestershire, on Saturday, a scratch hill-climb for motor cyclists was held, for which two prizes were offered (1) for the fastest time on a touring machine up to 500 c.c., and (2) for the slowest time on a single-gear touring machine up to 500 c.c.

There were fifteen entries. Results:

EVENT 1.		Time.
		m. s.
1. A. Elson (3½ Triumph)	...	2 43½
2. B. Alan Hill (3½ Rudge)	...	2 44½
3. J. V. Pugh (3½ Rudge)	...	2 49½

EVENT 2.		Time.
		m. s.
1. J. V. Pugh (3½ Rudge)	...	9 19½
2. V. A. Holroyd (3½ Rudge)	...	8 13
3. C. S. Burney (3½ Rudge)	...	7 19

Mr. Pugh (the club president) made a bad start in the fast ascent or might have made fastest time. His times showed the biggest margin.

Bradford M.C.C.

The autumn handicap hill-climb was held on Tong Hill on the 16th inst., and resulted as follows: 1, P. Shaw (3½ P. and M.), 9s. start; 2, A. Harrop (5 Rex), 13s.; 3, J. N. Longfield (3½ T.T. Triumph), 6s. The men were handicapped from H. D. Shaw (7 Indian), who was on scratch. There were twenty competitors. The gradients on the hill vary from 1 in 7 to 1 in 9. Length 1,200 yards. The event was run in heats of two on knock-out principle.

The handicap speed trials were held on the 17th inst.

	H'dcp.	Actual Speed.
	m.p.h.	m.p.h.
1. Sheard Grange (3½ T.T. Triumph)	62	72.1022
2. F. D. Sugden (3½ Rex)	...	48 51.1274
3. C. Sidney (3½ T.T. Triumph)	52	55.978

First, gold medal; second, silver; third, bronze.

The riders were handicapped by the committee, and the men making most improvement in m.p.h. handicap were placed in order of merit. Timed over 440 yards flying start. Time-keeper, Mr. Jack Scriven.

Scottish Border M.C.C.

An open hill-climb was held at Lanton Hill, near Jedburgh, on the 16th inst., in beautiful weather. Results:

LIGHTWEIGHT HANDICAP.

Rider and machine.	Time.	Fig. of
	secs.	merit.
1. W. Tait (2½ h.p. Enfield)	80½	104
2. T. Gillies (2½ h.p. Douglas)	88½	120

SINGLE-CYLINDER HANDICAP.

1. R. H. Monat (3½ h.p. Rudge)	63	86.6
2. W. B. Smith (3½ h.p. Bat-Jap)	72½	87.6

MULTI-CYLINDER HANDICAP.

1. W. J. Burn (5 h.p. Indian)	68½	102
2. A. J. C. Lindsay (5 h.p. Matchless)	58½	103.2

PASSENGER MACHINES HANDICAP.

1. W. B. Smith (3½ h.p. Bat-Jap)	108	96
2. J. R. Alexander (7 h.p. Indian)	89½	113

KNOCK-OUT COMPETITIONS.

Lightweights—W. Tait.

Single-cylinders—W. Kirkpatrick.

Multi-cylinders—A. J. C. Lindsay.

The race between Lindsay and Alexander was very fast and exciting. They rode neck and neck for a very long way, then Lindsay forged ahead and won by fifteen yards.

Special prizes for fastest time on Ross petrol: W. Tait (2½ h.p. Enfield), R. H. Monat (3½ h.p. Rudge), and J. R. Alexander, jun. (7 h.p. Indian), who made fastest time of the day.

OXFORD M.C.C. v. SUTTON COLDFIELD A.C. INTER-CLUB HILL-CLIMB AT NEWNHAM.

(1) The starting point. H. S. Askew (Triumph) of the Oxford team in full flight.

(2) C. Roper (Ivy-Precision) of the Sutton Coldfield A.C. team finishing. He tied for fastest time with two other members of his club.

Motor cyclists at the annual outing of the Hull Motor Club to the home of their president, Dr. W. A. Coates, Patrington.

Doncaster and District M.C.C.

To-day (Thursday), starting at 3-30 p.m., a hill-climb open to members of the Northern League will be held at Stainborough Lowe, near Barnsley. There are three classes.

North Middlesex M.C.C.

A petrol consumption test will be held on Saturday, next, 30th inst., meeting at Totteridge Station at 3.30 p.m. The scales will be closed down at 4 p.m. sharp. It has been decided to use the A.C.U. formula. Sidecar combinations are specially desired.

The annual reliability trial for a handsome silver trophy takes place on October 8th, and a circular route covering about 150 miles has been chosen. The prize list is considerable, and will be duly announced.

North-eastern A.A. (Motor Cycle Section).

The revised result of the reliability trial to Patterdale and back, in conjunction with the Sunderland and District Motor Club, has just been issued: The following seven competitors tied for first place, and it was decided that each should be awarded a silver medal: J. Whittaker, W. H. Fairclough, G. W. Raper, F. Turvey, jun., R. B. Smith, T. Smith, and J. B. Reed.

The following is the result of the hill-climb at Tunstall Hope on the 9th inst.: Single-cylinder class.—1, C. W. Smith (2½ h.p. New Hudson); 2, G. W. Raper (2½ h.p. A.J.S.); 3, R. B. Smith (3½ h.p. Ariel).

Sheffield and Hallamshire M.C.C.

A flexibility hill-climb was held at Stannington on the 16th inst., the competitor showing the biggest difference between his fast and slow climbs being the winner. Result: 1, J. Haslam (6 h.p. Zenith); 2, F. Donovan (6 h.p. Zenith); 3, C. E. Squire (5 h.p. Roc); 4, T. Durant (3½ h.p. J.A.P.).

Halifax and District M.C.C.

A trade v. amateurs reliability run was held recently by the above club. Only the utmost reliability of the machines and driving abilities of the riders enabled three competitors to score full points, two of these being amateurs, namely, F. E. Jackson (3½ h.p. Humber) and C. J. Lumb (3½ h.p. Rex), the trade member being J. E. Holdsworth (3½ h.p. Rex). The result proved a win for the trade members, who gained 86% of the possible marks against 67% scored by the amateurs. The rules were very stringent, and competitors arrived home much after dark, which made running to schedule time very difficult. A pleasing feature was the freedom from punctures, not one being experienced by any member. The hill known as the Ainleys at Elland soon tested the machines' climbing abilities, and thus early accounted for many members losing points. Owing to the somewhat early start—7 a.m.—a six hours' stay was obtained in Matlock, which was greatly enjoyed by all members. The weather was all that could be desired. This is the last competition of the season, three runs are still left on the official card.

AMULREE HILL-CLIMB. J. W. Adamson (3½ h.p. Triumph), who made fastest time of the single-cylinder riders. He is seen rounding the lower of the two hairpin bends.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Ignition Timing.

Q. My machine is of 1911 manufacture, and has a $3\frac{1}{4}$ h.p. Peugeot engine, 84×90 , M.O.I.V., Bosch magneto, B. and B. carburettor. I find the engine to be extremely flexible, and can drive it at an absolute walking pace without the slightest sign of a misfire, and without the machine jumping at its work. At speed and on hills, however, I cannot run the magneto fully advanced, or a slight knocking ensues, especially if I do not retard early on hills, and if there is anything like a strong wind on the level. I cannot quite understand this, as the machine has always acted in the same manner since it was new, whilst a Triumph, which I frequently ride, never requires the spark lever retarding at all, either to start, on hills, or under any other circumstances. Will the trouble be due to the magneto being timed a little too early? If you think this is the probable cause, will you please inform me as to the best way in which to re-time it. The

machine has run about 1,600 miles, and has not yet had the cylinder removed to take the carbon deposit off cylinder head and piston, although it has been rather freely oiled. I do not attach much importance to this fact, however, for, as I have said, the running has always been the same since bringing the motor new out of the works. With ignition about two-thirds advanced, the running is first-class, and the cycle will climb practically anything on the main roads in this country with a gear of $4\frac{3}{4}$ to 1, reduced on tricky ascents to $5\frac{1}{2}$ to 1. Are these gears any too high to expect the machine to perform well? If so, what gears do you recommend? I use Price's Huile de Luxe, oil every five miles with a half pumpful, and drive in the ordinary way as regards throttle and air. I have a multiple jet in the carburettor, since fitting which I get greatly increased power on hills and ease in starting, also the petrol consumption is slightly lower (about 105 miles to the gallon).—A. M. POLLARD.

We should imagine that the reason is entirely due to the ignition timing being too far advanced. In this event uncouple the magneto, put the piston on the top of the firing stroke, and turn the magneto rocking arm until the points just separate. Then, if the magneto advance lever is put one third advanced from the full retard position and the magneto coupled up again, the timing should be suitable for an engine of this description. We should imagine it would be well, in any case, to remove the carbon deposit after a distance such as you say the machine has travelled. The gears are not too high for the machine in question. It should certainly stand at least $4\frac{1}{2}$ to 1. There is one other explanation of the phenomenon, which is, that the magneto lever can be advanced further than is actually necessary for the machine, and in this case it would be only necessary to drive with considerably more retard than you do at present. We take it that you quite understand that a slowing of pace will result from retarding the spark timing.

A Machine for Sidecar Work.

Q. Please give me your advice re the purchase of a motor cycle. I shall not require the machine until the spring of next year, and intend visiting the show in November. I might say that I have favourably considered a 5-6 h.p. Matchless-Jap two-speed, as these machines appear to be reliable. I require a reliable machine for sidecar work with lady in car. I weigh $10\frac{1}{2}$ stones and the lady $9\frac{1}{2}$ stones. I want to be able to climb fairly steep hills, as I live in Kent, and shall tour in Sussex and Surrey. I want a machine which gives the greatest amount of comfort with smoothness of running and small amount of noise, and which will keep up an average of, say, 15 to 20 m.p.h., yet without my having to race up hills to keep the engine going. As I put reliability to the front, I should want a speed gear (if you recommend this) which has stood the test of time. (1.) Do you recommend chain or belt drive? (2.) Is it necessary to have a two-speed if a twin-cylinder free engine is used? Would an adjustable pulley do instead, to save expense? I do not want to rush about at a great speed, but wish to keep up an even pace as far as possible. (3.) Does a castor wheel compensate for the danger of side-slip as a rigid sidecar does?—G.N.W.

CLIMBING AMULREE, ONE OF THE MOST DIFFICULT HILLS ACROSS THE BORDER.

This illustration gives an excellent impression of the steep gradient and double hairpin bend. A Bap-Jap rider is seen competing in the Edinburgh M.C. open competition last week.

Independence ?

The motor cyclist is the most independent man on the road. He only needs one thing to make him independent everywhere—and that is a lathe.

With a lathe in his workshop he is absolute master of his machine, need call in no outside help for repairs, and will find the work a continual source of enjoyment as well as a great money saver. And the initial outlay is slight.

The 4 in. centre lathe illustrated here is screw-cutting and milling, price £5, and the footmotor is 30/- only. Write for further information.

Drummond Bros., Ltd., Read Hill, Guildford.

The PERFECT Motor Cycle SPEEDOMETER

equal in quality to the WORLD-RENOWNED

PERFECT SPEEDOMETER

for cars,

Price £3 10 0.

Having now completed the hundreds of orders we received at the November Cycle Show we can promise

IMMEDIATE DELIVERY.

S. SMITH & SON, LTD.,

Holders of Six Royal Warrants for Speedometers,

9, Strand, LONDON.

Your selection is an excellent one, and you cannot do better than visit Olympia in November as suggested. (1.) A chain is the more efficient drive for passenger work. (2.) For a beginner we recommend belt transmission and a single gear for solo work, but if you are going to use a sidecar a variable speed of some kind is desirable. An adjustable pulley is useful, but it is, after all, only a makeshift. (3.) Yes; but the castor wheel sidecar is not so good a preventive against side-slip as the rigid type. The machine you have referred to in the first part of your letter is quite good, and we can thoroughly recommend it as likely to satisfy all your requirements in the way of speed and smooth running. The gear fitted is, moreover, quite reliable.

To Run Slowly.

Q. I have an old-fashioned $3\frac{1}{2}$ h.p. Humber accumulator machine which I cannot get to run slowly—it either goes at top speed or will not go at all. Can you tell me what is the matter, and would an up-to-date carburetter make any difference? If so, what make would you recommend? I may say there is no h.b.c., only switch.—R.T.S.

You are obviously getting too much air, and most probably *via* the main air inlet. Close extra air, almost close throttle, and retard spark. An up-to-date carburetter would certainly be an advantage.

Ambleside to Wantage.

Q. Would you kindly inform me of the best route from Ambleside to Wantage (Berkshire), avoiding as far as possible large towns, trams, and setts? What would be the total mileage by the route given?—E.S.K.

Your best route will be Ambleside, Kendal, Lancaster, Preston, Wigan, Warrington, Tarporley, Nantwich, Stafford, Gailey Cross Roads (turn left along Watling Street, taking left-hand road at fork and avoiding Walsall and Cannock).

Brownhills, Erdington, Stonebridge, Kenilworth, Warwick, Banbury, Oxford, and Wantage. It is difficult to avoid the Lancashire towns. The distance is just over 250 miles.

Sidecar Steering.

Q. For the last ten months I have been driving a $3\frac{1}{2}$ h.p. P. and M. and Mills and Fulford spring wheel sidecar. I find the steering and generally the handling of this combination as a rule most satisfactory, but from time to time an extraordinary thing happens, which is attended with great danger. Whilst driving along an ordinary road with a good surface, the combination without any warning alters its direction and dashes at an angle towards the side of the road. On the first two occasions of this occurrence I put it down to tyre trouble on the sidecar. But on the last two occasions, which took place on the same day, and at an interval of two

CLIMBING EDGE HILL IN THE A.C.U. INTER-CLUB CHAMPIONSHIP.

or three miles, there was no question of the tyres being at fault. We were travelling at a moderate pace, and when the combination altered its direction, and made for the side of the road, I was able to pull it up before any damage was done, and found all tyres intact. On this last occasion I found that the steering head was slack, and that the springs on the forks required tightening. Would these facts account for the accident? The sidecar wheel has no play whatever, and runs as smoothly as possible. The sidecar has been most carefully coupled to the machine. My point is, whether the combination would suddenly develop this "freak," as a result of the slack (loose) steering head of the machine, having given no previous symptoms of the difficult steering. The direction taken by the combination is always away from the sidecar. I have had the steering head down and carefully examined, and ball races and everything are in perfect order. Can you suggest anything?—E.S.C.K.

Certainly the fact that the steering head is loose and that the spring forks require tightening would account for the trouble. The looseness of any part of the sidecar attachment would cause erratic steering. We have carefully considered your letter, and cannot think of any other reason.

EXPERIENCES WANTED.

"L.C.E." (Co. Wicklow). 5.6 h.p. F.N.
 "L.D." (Kingston-on-Thames) would like to know the address of the makers of the Haslam rubber and chain belt.
 "H.W.B." (Tipperary). Exhaust whistles, especially the Garner on a $3\frac{1}{2}$ h.p.
 "S.J." (Walthamstow). A.C. sociable and Morgan runabout.

(1) Exercise which some competitors would have been glad of.

(2) Nearing the summit.

(3) Will the engine do it?

Magnetos and Hill-climbing.

The first seven machines in the light-weight class of the Mont Cenis hill-climb in Italy were fitted with the "U.H." magneto. The agents in this country for the "U.H." magneto are Messrs. S. Wolf and Co., of 115, Southwark Street, Blackfriars Bridge, S.E.

Mudguarding.

We are in receipt of the preliminary 1912 list of the Wasdell Rim and Tube Company, Ormond Street, Birmingham. The firm make specialities of motor cycle mudguards and number plates. The frontispiece illustrates a well constructed mudguard complete with side shields and front number plate, which appears to be a thoroughly satisfactory article. A special point is also made of sidecar mudguards and wings for tricars and runabouts.

A Handy Sidecar Stand.

The A.J. sidecar stand (sold by A. J. Sproston) should appeal to sidecarists, as it renders puncture repairs much more

easy to effect. It also enables the sidecar to be detached single-handed with comparative ease. It is automatically operated by means of a spring, and one need but press the leg on to the ground with the foot and pull the sidecar back to bring it into engagement. It

is useful as a sprag on hills.

Our Bookshelf.

"Motoring in the North of England," E. J. Burrow and Co., Cheltenham and London, is the latest addition to the excellent series of guide books published under the auspices of the Royal Automobile Club Touring Department. The author is Mr. Chas. G. Harper, the compiler of "The Autocar Road Book," while its revision by Mr. H. A. T. Moroney, secretary of the R.A.C. Touring Department, ensures the book being not only accurate, but entirely suitable for the purpose for which it is intended. The letterpress, written as it is by so great an authority as Mr. C. G. Harper, is most interesting, while the excellent series of maps, especially those which show the way through such populous towns as York, Preston, Newcastle, and Darlington, are of the greatest utility.

"Electrical Ignition," M. A. Codd, E. and F. N. Spon, 57, Haymarket, W. Nearly every motoring handbook has its chapter on ignition, but those who desire to study the subject more fully require to peruse a book like that written by Mr. Codd. It is thoroughly up-to-date, although the coil systems are adequately described. The magneto side of the subject is gone into fully, and the latest types of machines are described.

Both these publications may be had from Iliffe and Sons, Ltd., 20, Tudor Street, E.C.

The Motor Cycle in Holland.

We understand that business in motor cycles is on the steady increase in Holland, and there is a great demand for machines selling at about £40 complete. Manufacturers who make motor bicycles selling at about this price should correspond with Mr. H. Posno, Hooiidrift 60a, Rotterdam, Holland.

A Special Tyre for Sidecars and Tricars.

If those readers who complain of the short life of the average tyre when used with a sidecar attachment would realise that the tyre was never intended for passenger work, less trouble and less grumbling would follow. To stand up to the work of a sidecar attachment, the driving tyre should be especially strong. The Lomax Tyre Co., William Street, Birmingham, recognising that an ordinary standard tyre is not equal to the extra strain of a sidecar, have for a long period specialised in the production of an extra strong cover modelled on car tyre lines, the casing of which is specially reinforced. This particular Lomax cover is being used with great success by a number of our readers on the driving wheels of tricars and sidecars.

Rubber Goods.

The rubber and canvas belt introduced by the Roberts Motor Tyre Co. is meeting with much success. We are using one ourselves, and shall shortly publish our opinion of it after an extended trial. Vulco repair outfits are another speciality of this company, whose address is St. Mary's Row, Birmingham.

Peugeot Repair Works.

A small factory on modern lines has been built on the Warwick Road, Birmingham, for Mr. J. Taylor, the agent for Peugeot engines in this country. Repairs to all types of Peugeot engines may now be promptly effected. Mr. Taylor's new address is Motor Works, Warwick Road, Birmingham.

Phosphor Bronze Bearings.

We are frequently asked for the name of makers of phosphor bronze bushes, and can refer enquirers to the Phosphor Bronze Co., Ltd., Chester Street, Aston, Birmingham. Their representative, Mr. Phil Mosedale, who is himself a keen motor cyclist, recently called upon us and brought to our notice the fact that this company market phosphor bronze chill cast bushes and sticks in a convenient form for amateur engineers. The sticks are cored and are specially suitable for machining into small motor cycle bearings.

Readers mechanically inclined will be interested in a new white metal called Plastic metal, which is an alloy chiefly used for lining up bearings and shafts, and is particularly useful for bringing up worn bearings or shafts to their original size. It is said to adhere firmly to iron, steel, brass, and bronze, and its contraction in cooling is practically nil.

OPEN HILL-CLIMB ON AMULREE.

J. Gerard travelling fast on the lower reaches of the hill on his 3½ h.p. Bradbury. The surface of the road is very rough at this point; the photograph shows the front wheel clear of the ground.

At last, the great drawback to enjoyable motor cycling has been removed. Vibration and its attendant evils have been overcome.

Since the introduction of the pneumatic tyre, no invention has been found to eliminate these obstacles so effectively as the A.S.L. MOTOR CYCLE.

Let not prejudice blind you to the advantages of "riding on air" as offered in the A.S.L. Motor Cycle. Made in two models, 3½ h.p. Single-cylinder and 5 h.p. Twin-cylinder, the machines conform to the latest design in general appearance, the air springs being cleverly incorporated in frame with pleasing results.

MOTOR CYCLE IS LIKE RIDING ON AIR.

MOTOR BICYCLES FOR SALE.

P and M. and Rover, both 1911, equal new: £61 and £50, or offers.—E. S. Piercy, York.

1911 Scott, in excellent condition, purchased April: £50.—Seal, Nevill St., Southport.

N.S.U. 4h.p. Twin, 2 speeds, Bosch, sidecar; trial: best offer.—Butterworth, Greenfield.

TWIN Alcyon, 5h.p., good order: £16, or exchange single.—George Firth, Ossett, Yorkshire.

TRIUMPH, standard, 1911, with sidecar, done 2,000 miles: £46.—37a, Nevill St., Southport.

1909 3½h.p. Rex de Luxe, 2-speed, splendid condition: cheap.—48, Church Rd., St. Annas-on-Sea.

WOLF Lightweight, 1½h.p., new condition, perfect order: £18.—180, Smithdown Rd., Liverpool.

1910 Rex, 3½h.p., new belt, lamp, accessories, splendid condition: £25.—20, Pottennewton Lane, Leeds.

3½h.p. Singer, Bosch magneto, new tyres, splendid machine: accept £11.—65, Hilden St., Bolton.

5h.p. N.S.U., lamp, horn, tools, just spent over £6 on overhauling: £24.—Collier, Chester St., Leigh, Lancs.

PREMIER, 3½h.p., 1910, good condition: £26, close offer.—Particulars from Edward Earlham, Frodsham.

6h.p. 4-vel. F.N. Motor Cycle, new 1910 engine: £21 or offer, quick sale.—Apply, Stanley Garage, Bury.

PHELON-MOORE, late 1908, Millford sidecar, good order: £34.—Locke, Ripon Terrace, Akroyden, Halifax.

1910 Triumph, 3½h.p., free engine, new last October, tyres new: price £40.—Shaw, 335, Lees Rd., Oldham.

1911 Standard Bradbury, not unpacked: first cheque £42.—No. 8,544, The Motor Cycle Offices, Coventry.

1910 3½h.p. Triumph, perfect condition, re-bushed, numerous spares: £35.—E. Chadwick, Wharf St., Preston.

1911 Humber Lightweight, in new condition: £28/10, or nearest offer.—Address, B. c/o 51, Standishgate, Wigan.

3½h.p. Rex, good condition, low saddle, footboards, 2 good tyres: £8, or best offer.—Lyons, 117, Tongue Moor, Bolton.

2h.p. 1910 Twin Moto-Rex, splendid running condition, everything perfect: £23.—Snowball, 62, Filer Rd., Scarborough.

1907 Triumph, 1909 cyl. piston, B. and B. h.b.c., Bosch; exchange lightweight, or sell, £23.—30, Dale St., Blackpool.

1911 Scott, perfect condition, lamp, horn, generator, complete, ready for road: what offers.—Sixsmith, Market St., Wigan.

HUMBER, 1911, 2-speed, 3½h.p., and art case sidecar, lamp, horn, and spares: £48.—Fiddling, 5, Alma Rd., Birkdale.

N.S.U., 1911, 3½h.p., Model de Luxe, 2-speed and free engine, brand new: £40.—Graydon, 19, Kennington Rd., St. Annas-on-Sea.

5-h.p. Rex, Brown and Barlow carburettor, h.b.c., Whittle, Kempshall back, good condition: £17.—79, Albert Rd., Sheffield.

5h.p. Indian, 1910, perfect condition, only ridden 3,000 miles, F.R.S. lamp, numerous spares: £37.—Campbell, Mount Royd, Bradford.

3½h.p. Premier, 1910, variable pulley, Dunlop belt and tyres, in splendid order.—L. Holt, Knowle House, Horwich, Lancashire.

MINERVA, 3½h.p., Mabon, handle starting, h.b.c., takes sidecar, splendid condition: bargain, £14, nearest.—Ormsby, East Hatley.

1911 New Hudson, 2½h.p., 3 speeds, chain drive, Cowey: cost £60; perfect, 1,000 miles: £49; bought car.—Dr. Muir, Halifax.

MOTOSACOCHE, bought 1911, free engine, guaranteed as new; ride 50 miles purchaser; cash offers wanted.—80, Bisham Rd., Southport.

SACRIFICE.—Humber, 2½h.p., accumulator, chain driven, cost £8 overhauling, enamelling, and plating, new B. and B. new covers, machine equal new: approval: £10.—80, Bisham Rd., Southport.

BAT, 8h.p., 1911, J.A.P. carburettor, J.A.P. pulley, drip and pump, new tyre and belt.—Further particulars, Gregson, Hesketh Rd., Southport.

1911 5h.p. Rex de Luxe, new F.R.S. lamp, Whittle belt, spare tube, complete accessories: £50, lowest.—Beesley, Charlestown Rd., Blackley.

BRADBURY, 1911, 2-speed and free engine, complete with new sidecar, only been for trial runs: cost £65, what offers?—Cockburn, 20, Rosemount, Consett.

£16, cost £48.—3½h.p. twin Werner, new condition, and perfect, takes sidecar, tools, spares, consider lower power in exchange.—22, Hambleton Terrace, York.

TRIUMPH, late 1911 standard model, new Lucas headlight, horn, watch, all spares, in perfect condition: 40 guineas; only wants seeing.—Park, 167, Wigan Lane, Wigan.

ZEDEL, 2½h.p., Palmers, Hellesen ignition, Amac, h.b.c., stand, spring forks, carrier, spare tyre, low in good condition: £10.—Rosedene, Chorley New Rd., Bolton.

CORONET SIDE CARS

MOTOR BICYCLES FOR SALE.

4 h.p. Roe, magneto, 1911, B. and B., handle starting, J.A.P. pulley, splendid condition, with new sidecar; £26/10. offers, separate.—13, Pleasant Grove, Blackpool.

£7/10, great bargain.—2½ h.p. Bat-De Dion, accumulators, one new, back cover and tube new, belt new, spares, good running order.—Martin, 16, Hallam Gate Rd., Sheffield.

F.N., 5-6 h.p., h.b.c., magneto, good running order, not run 200 miles since overhauled by maker, too fast for owner; £24, or exchange good single.—J. Longster, Pateley Bridge.

CLYNOS.—Can deliver latest model, 2 speeds, chain drive, at once, demand far exceeds supply, don't miss this, nothing better.—Potter, Clyno agent, Leicester Grove, Leeds.

1910 Triumph, Jones speedometer, exhaust whistle, lamp, watch, spare belt, all accessories; £35, no offers; excellent machine; genuine bargain.—12, St. Paul's Parade, Sheffield.

1½ h.p. Lightweight P.N., magneto, engine recently overhauled by makers, new spring forks, Whittle belt, spares; £15. Hughes, Ellesmere Rd., Lower Walton, Warrington.

TRIUMPH, late 1909 clutch model, Palmer cord back, Dunlop special front, nearly new, splendid condition; nearest cash offer £36.—Poole, Langholm Crescent, Darlington.

HUMBER, 3 h.p., 2-speed gear, handle starting, new August, 1910, only ridden occasionally, excellent condition, also sidcar, unused.—Norris, 18, Wyndcote Rd., Mossley Hill, Liverpool.

MINERVA, 4 h.p. twin, 2-speed, free engine, Bosch magneto, Brown-Barlow, with sidcar, all accessories, spares, fine condition; £30, no offers.—38, Carill Drive, Fallowfield, Manchester.

DE DION, Chater-Lea, accumulator, 4 h.p., 1911 Brown-Barlow, Whittle, tyres and tubes practically new, good sidcar machine, too powerful; £16.—Wheatley, Ropetrag, Pontefract.

DOUGLAS, 1910, late model, Continental tyres, Whittle belt, lamp, generator, horn, spares, splendid condition throughout; £27.—W. Teer, 69, Cavendish Rd., Chorlton-cum-Hardy, Manchester.

TRIUMPH, 1910, hardly used; Triumph, 1909, just overhauled by makers, and standard Rudge-Whitworth, 1911, all in first-class order; exchanges entertained.—West Yorkshire Garage, Settle.

4 h.p. Twin Rex, T.T. roadster, overhead mechanical inlets, 24 tyres, spring forks, Lucas lamp, new August, 1910, splendid condition; £36.—W. Garlick, 471, Manchester Rd., Hollinwood, Oldham.

TRIUMPH, 1911, free engine, very little used, condition as new, lamp and generator, overall, and spares; would ride 100 miles to genuine purchaser; 45 guineas.—2, Ellesmere Rd., Pemberton, Wigan.

WERNER, 4 h.p., twin, 2 accumulators, Brown and Barlow, back tyre, 2 inner tubes, carrier, stand, handle-bars, brake, Lyso belt, piston and rings, all brand new; take £12 cash.—Hornby, Pleasington Hall, Blackburn.

1909 Motosacoche, bought new in 1910, Druids, magneto, Whittle; £20; would exchange for modern 2-speed passenger motor cycle, 1911 model preferred; cash adjustments.—Griffiths, 31, Downing St., Ardwick, Manchester.

5-6 h.p. F.N., guaranteed perfect, and practically new, steel studded, non-puncturable, tyres unmarked, most carefully handled, all extras, most exceptional bargain; first money order £27/10 secures, no offers.—Coronation, 40, Cockburn St., Liverpool.

2½ h.p. Enfield, October, 1910, 1911 model, just overhauled by makers, spring seat, headlight, generator, horn, spare belt, cyclometer, tools, spares, Palmer cord tyres, enamelled black, excellent condition; £26.—Hart, 17, Humphrey St., Old Trafford, Manchester.

1911 Standard Triumph, £48/15; 1911 standard Bradbury, £48; 1911 clutch (Triumph) Rover, new six weeks ago, £37; 1911 2½ h.p. New Hudson, 3 speeds, £47; 1910 3½ h.p. Minerva, 2-speed Simplex hub gear, £30; 1909 V.S., 5 h.p., 2-speed, perfect, £30.—Wray, Virginia St., Southampton.

INDIAN, 1911, free engine, 2 speeds, 7 h.p., new June, little used, with Mills-Fulford roomy castor spring coach body, cost £110, splendid touring combination; offers invited, or would entertain exchange motor car, 1910 4-seater torpedo, known maker, over 9 h.p.—Leters, George Lascelle, turf accountant, South port.

3½ h.p. Minerva, 1910 and 1911 fittings, Chater-Lea frame, Davidson tank (petrol and oil gauge), Druid forks, magneto and carburettor behind engine, Whittle belt, Brooks padded top saddle, all accessories, only been built 2 months; £30; would exchange for 1910 or 1911 twin with 2-speed gear; cash adjustments.—152, London Rd., Manchester.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SINGER Velo Lightweight, 1911 pattern, 2 h.p., new, shop-soiled only; £27.—Deacons, Llandudno.

FREE Engine Triumph, July, 1910, absolutely perfect order, all accessories; £45.—Smith, saddler, Shrewsbury.

Have you . . ever thought

that instead of advertising your Motor Cycle in the papers, and being deluged with offers of Bull Pups, Prize Poultry, fancy Pigeons, Gramophones, Typewriters, Brass Bedsteads, and other furniture, in part payment for your Motor Cycle, or tempting offers at £2 down and 2/- a week; or again, £10 down, and the remainder SOMETIME, or otherwise NO TIME; or may be the very common offer of high-class Accumulator machines which your Buyer values at £15, and you value at 15/-, and the remainder in cash,—that it will be better to send your machine up to Hitchens, of Morecambe, to be sold on 5% commission, when you will be sure of getting CASH for it, letting Hitchens be troubled with the Bull Pup offers, and the other Sunny Jims, who have something to get rid of.

HAVE YOU EVER THOUGHT that when you decide to buy a machine, it is very much better to send your money up to Hitchens, of Morecambe, who will send you a machine on approval for you to try, and if not satisfactory, return and have your money back in full. THIS IS A SILLY THING to have to remind you of, bearing in mind the fact that you have read this offer for the last two years, week by week. This game is a great deal better than indulging in the luxury of buying a machine, and finding it of no use to you, and having to trot down to your solicitors, or writing a four-page letter to the editor of "The Motor Cycle," telling him of your trouble. No doubt he will feel full of sympathy for you, but his advice will be very similar to mine, BE CAREFUL WHOM YOU DEAL WITH.

HAVE YOU NEVER THOUGHT that when you want to exchange a machine, buy a new machine, or buy a good second-hand one, that the only right and proper place to purchase one is where they have the LARGEST STOCK in the WORLD—Hitchens, of Morecambe. There you can try the machine on the road, and, if not satisfactory, leave it behind. You can walk into the Garage, walk round, and walk out; no one will trouble you. If you want to BUY ANYTHING, open your mouth; if not, you can walk out without SAYING ANYTHING. There is no necessity to purchase.

What is a Bargain?

Is it a matter of first cost, or a matter of total cost? Most certainly the latter is the item to consider, and if you take the opportunity we are now giving you of buying a brand new 1911 Motor Cycle at a bargain price, you can make no mistake.

We must again "rub it in" that the machines we are offering are not so-called "1910 models" assembled from a miscellaneous assortment of out-of-date parts, for we know if we sold you such a machine we should lose your custom for ever.

We have a reputation to uphold, and every machine we are offering is a brand new 1911 model, and carrying makers' full guarantee.

This Week's Special Offer!

One

1911 3 1/2 H.P.

Free Engine **REX,**

G. RAWES & SONS' MOTOR CYCLE CLOTHING SALE!

Locks next and feels comfortable.

The end of the season is approaching, and we are determined to clear our surplus stock at a reasonable reduction of 10%.

ALBANY "STANDARD" SUIT.

In grey-green or fawn double-texture cloth. Guaranteed absolutely waterproof. We sell garments separately.

JACKETS ONLY.—Double-breasted, deep storm collar, and special adjustable strap to keep out rain and dust. Inside and outside wind cuffs, etc., etc. 18/-, less 10%.

16/3.

LEGGINGS ONLY.—Leather adjustable boot strap, V-shaped gussets, and patent dome fasteners to exclude wind, rain, and dust. Specially shaped to protect eyelet holes. 8/-, less 10%.

7/3. Complete Suit, 25/-, less 10%, 22/6.

Albany "Special" Leggings.

In grey-green or fawn double-texture cloth to match "Standard" Jacket. Guaranteed absolutely waterproof. All latest improvements, and specially designed to come well up and protect the stomach from wind and rain. Without seat 13/11, less 10%, 12/6. With seat, including special convenience, 15/11, less 10%, 14/6. For Winter riding these "Specials" are indispensable. Buy now while prices are reduced.

Albany "All-Season" Jacket.

In grey-green double-texture cloth only Double-breasted, deep storm collar, and inside and outside wind cuffs. Guaranteed absolutely waterproof. Fitted with best detachable fleece lining. 25/- each.

Being motor cyclists ourselves, we found it very cold riding in Autumn and Winter, so this jacket was designed specially for all seasons. By simply detaching the lining, the coat can be worn in Summer. It is a great boon, and so great is the demand, and value so good, that No Reduction is possible.

Very warm and comfortable.

Albany "Guinea" Suits.

In double-texture waterproof cloth, 21/- less 10%, 19/-.

Advice to Purchasers.—These goods are of genuine stock, and every garment is guaranteed absolutely waterproof. Should you not be satisfied, we will refund amount paid if goods returned undamaged in 3 days.

Terms.—Nett Cash with order. Send chest measurement and length desired for Jackets, and inside leg measurement only for Leggings.

Send for Catalogue and patterns to—

G. RAWES & SONS,
Waterproof Clothing Specialists,
The Albany, Oldhall Street, LIVERPOOL.

RILEY, 6-h.p. twin, w.c., wheel steering, bucket seats, coach-built throughout, 3 speeds and reverse, condition as new; seen by appointment; £35, no offers.—Purhouse, 32a, Aristotle Rd., Clapham.

TOTTENHAM.—Tricars; 3-h.p. Triumph, water-cooled single-cyl. engine, £15; 3-h.p. White and Poppe, single-cyl., water-cooled, 2-speed gear, £14.—Stamford Hill Motor Co., 128, High Rd., Tottenham. 'Phone: 1982.

6-h.p. De Dion Engine, open frame, wheel steering, 2 speeds and reverse, chain drive, car tyres, coach-built seats, well upholstered, in good order; £20, or motor cycle in part exchange.—Wilson, 16, Trinity St., Gainsborough.

A.C. Sociable, 5-h.p., speed model, specially built, hood, wind screen, two powerful headlights, Pythian horn, steel non-skid rear, many extras, in perfect order; cost £120, accept £85 genuine bargain; any trial.—Williams, 41, Bonham Rd., Brixton.

41-h.p. Riley Tricar, coach-built both seats, and well sprung, new 21 car tyres, wheel control, w.c., free engine, 2 speeds, dynamo for accumulator and lighting, splendid condition; price, with £5 worth of spares, £26.—182, Elizabeth St., N. Woolwich, E.

A.C. Sociable, 2-seater, screen, luggage carrier, side lamps (oil or electric), tail lamp, acetylene head lamp (2 generators), front wheel brakes, side aprons, 2 spare inner tubes and outer covers, spares and tools, Jones speedometer, 1911 model, shown at Stanley Show, thoroughly overhauled; price £85.—8,520, The Motor Cycle Offices, Coventry.

SIDECARS AND FORECARS.

MONTGOMERY Cane Flexible, right or left, sound condition; £3, or offer.—Mizen, Downton, Wilts.

SIDECAR, rigid, art cane, Chater, Michelin, plated springs, 35/-.—33, Grosvenor Rd., Canonbury.

ROVER Forecar, in good running order, B.B. carburettor, spares.—359, Whitehorse Rd., Croydon.

1911 Millford Ostor Wheel Sidecar, beautiful order; sacrifice, £6/15 cash.—1, Elber St., Wandsworth.

SIDECARS, brand new, beautifully upholstered, fit any make; £3/10.—Rey, 5, Heath St., Hampstead.

MONTGOMERY Flexible Sidecar, coach-built, with apron and tool box; £4/10.—Sinclair, East Molesey.

GLORIA Sidecar, fitted with Dunlop stud tyre, new March last; £10.—Elliesslie, St. Patrick's Rd., Coventry.

MONTGOMERY Flexible Upholstered Sidecar, newly enamelled; £4, or offer.—A. Batty, Little Hulton, Bolton.

BRAND New Chater-Lea Sidecar; cost fortnight ago £27, accept £5/5.—35, St. Stephen's Rd., Bow, London.

8-GUINEA model sidecar, Chater-Lea detachable fittings, brand new; £5/5.—Matthews, pawnbroker, West Croydon.

SOCIABLE Forecar, 7-h.p., 2 speeds, operated as car, fine condition; £50, or take motor cycle part exchange.—120, High St., Merton.

MILLFORD Sidecar, 1911, side entrance, cane, cost £19/10, equal new; approval, deposit; bargain, £12.—56, Shirley Rd., Southampton.

MILLS-FULFORD Rigid Sidecar, cane body, cane front, cost £12/12, perfect condition; accept £7.—Box 8,528, The Motor Cycle Offices, Coventry.

FORECAR Frame and wheels, oak footboards, foot brakes, mudguards, adjustable any machine, really good condition; offers; sell or exchange.—Ernest Mays, Stechford.

Lamps and Winter Riding.

IN the report to the members of the Manufacturers' Union there is a paragraph stating that the Auto Cycle Union proposed a trial for motor cycle lamps, and members agreed to abstain from taking part therein.

We think it is quite right for the Traders' Union to abstain from taking part in any competition if it considers the regulations are unsuitable and not likely to lead to a definite result, but taking into consideration that there is a paragraph in the report stating that friendly relations exist between the Traders' Union and the Auto Cycle Union, and that the trade is consulted in making regulations for public trials, it would have been a matter of ease for the Traders' Union to point out to the A.C.U. where the regulations for the lamp trial failed, and to co-operate in the formation of fresh regulations which would have been satisfactory. There is no doubt that lamps are an important accessory, and the trouble with acetylene gas lamps is by no means at an end. That is to say, there is still a considerable amount of fiddling to get lamps to burn properly. Cleanliness is, of course, the first essential, but even then it is not always possible to obtain a good light and a steady flow of gas.

Now that the winter riding season is upon us, a lamp trial on proper lines would, we feel sure, produce good results. Motor cyclists will agree with us that it would be begging the question to say that a lamp trial is absolutely unnecessary, because every other motor cyclist, although fairly satisfied with the lamps now on the market, usually mentions that night riding would be very much more pleasurable if he could always be sure of absolute lamp reliability,

particularly in connection with acetylene generators. Our personal experience with most generators is that they are reliable if kept perfectly clean and only the very best quality carbide employed. Generators with outside fastenings for the carbide container are, as far as we can tell, slightly more satisfactory than those which depend upon inside screws, *i.e.*, where the decomposed carbide can get at the threads or other connections there is usually trouble after the lamp has been once used. This applies more particularly to those lamp generators where the screwed connection is at the base of the container and not at the top. We even look upon the reliability of the generator as a more important item than the volume of light projected by the lamp. Curiously enough, a few years ago British-made motor cycle lamps and generators were rather behind foreign articles of the same description. Now we are pleased to say Britain leads by a short head, and it will generally be found that in the purchase of such articles as lamps and generators it is advisable to pay a good price for a good article. Electric lamps are excellent, but on the point of reliability they are not equal, in our opinion, to gas lamps, unless one is prepared to carry one or two spare bulbs. Motor cyclists also object to carrying accumulators now that they have found out the almost absolute reliability of the magneto, and to carry heavy accumulators for the purpose of lighting lamps is rather objected to, particularly on week-end rides, when the lamps are only required for an hour or two each night. Dry batteries will, of course, light an electric lamp quite well, and are reliable, but we have not yet found an electric lamp and battery giving the same volume of light as a gas lamp and generator weight for weight.

Farlow Bank in the Quarterly Trials.

BEING rather curious to see if the above much-talked-of hill was as difficult as described, I, mounted on a 1911 standard Triumph, in company with three Birmingham friends, paid a visit to the hill last week, and I am relating my experiences in the hope that my remarks may be of guidance to some of the single-gear brigade who may have to negotiate this hill in the Autumn Quarterly Trial without any previous practice.

Having travelled the 140 miles from Harpenden, Herts., almost as fast as the A.C.U. official car usually goes (!), I arrived with a rather warm engine, and at once made two attempts to climb the hill with a $5\frac{1}{2}$ to 1 gear. Had the surface been hard or dry, I think in all probability I might have succeeded, with a little luck.

Having lowered the gear to $6\frac{1}{8}$ to 1, I had another try, and this time got round the hairpin bend safely, but skidded off the machine a little higher up. After this I climbed the bank three times in succession, and could have kept it up for the rest of the day.

One of my companions—a well-known T.T. Triumph crack hill-climber—had exactly the same experience as I, and the whole knack seemed to be to go

steadily and take the inside corner very close in, and although the gradient at this point seems to rise to an alarming extent, this portion has a firmer surface and is slightly banked the right way.

The Middle Bend the Worst.

The hill has three bends, and the middle one is the worst, and might well be described as a Sutton Bank corner on a steep roof, and two inches of loose small granite complete the agony. Being a trick hill pure and simple, it will account for a lot of failures on the 14th inst., and I should include some variably-gear machines among the number.

There were a few well-known variably geared machines being tested at the time of my visit, and they failed several times before the riders got the knack of approaching the bends. We found them there, and left them there, so perhaps they will wear the gradient down before the trial.

In conclusion, I might venture to express the opinion that if the day be wet all three bends should be taken close in and not too fast, or the back wheel will try and change places with the front one.

E. C. JARVIS.

The second and worst bend on Farlow Bank; the loose granite renders it very difficult to negotiate except at a walking pace. The rider is T. Silver on the new three-speed Quadrant we illustrated on page 1011 last week.

WE publish a selection of the more interesting letters on the subject of formulæ for hill-climbs on this page from readers who have considered and criticised our article on that subject. "J.W." has suggested an alternative and more complicated formula, and, while agreeing with much that he says, we still think that *The Motor Cycle* formula gives a sufficiently accurate result. We have calculated by "J.W.'s" formula the figures of merit of the six machines already taken as examples, and reduced the figures to correspond with our own, and append the result for the sake of comparison:

Machine.	Motor Cycle formula.	"J.W.'s" formula.
2½ Singer	385	385
3½ Precision (1)	392	391
3½ Singer	411	411
3½ Precision (2)	451	450
3½ Rudge	453	453
3½ Rover	460	459

By an oversight, Precision (2) was credited with a figure of merit of 439 in our previous article.

It will be seen that these figures are practically identical. With a view to testing the two formulæ on extreme cases, we took the T.T. Triumph which made fastest time for a single-cylinder with a light rider and the New Hudson three-speed lightweight which with a fairly heavy rider was first in Class 2, and the figures are as follow:

Machine.	Motor Cycle formula.	"J.W.'s" formula.
3½ T.T. Triumph	399	401
2½ New Hudson	366	367

Again the difference is hardly worth remarking, and we think all will admit, after reading the letters, that our formula is the simpler. This object, of course, we had in mind at the time of writing the article.

Not a Horse power Formula.

In reply to Mr. W. Woodward, we may say that we are aware that the power varies as the cube of the velocity; in fact, we stated as much in a recent issue. By "frictional resistances on lubricated surfaces" we refer to the internal friction of the engine and the bearings of the machine. If we were giving a horse-power formula, this, of course, should not be credited to the engine as part of its output, but our formula does not pretend to be a horse-power formula in any sense of the term.

If Mr. Colin Macmillan will read the letters already referred to, he will see that he is wrong in supposing that value assigned to the time should lie between t and t^2 . It should be between t and t^3 , and t^2 gives a very fair approximation, being, as Mr. Macmillan

contents that it should be, nearer to t than to t^3 . It should be pointed out, however, that the example given by Mr. Macmillan is not a good one, as the speed up a gradient of 1 in 12 would be nearer 50 than 35 m.p.h., and the air resistance consequently much higher. If we take it that a motor cyclist and his machine present an area of 5 square feet to the air resistance, 1.7 h.p. will be required to overcome this resistance at 35 m.p.h. and 5 h.p. at 50 m.p.h. A 4 h.p. engine specially tuned up for hill-climbing and with a large jet will give considerably more than 5 h.p. for a short time. Also we do not agree that our formula unduly favours the short stroke. The New Hudson machine already mentioned has a short stroke engine, being 76 bore \times 65.5 stroke, cubic capacity 297. Our formula gives the figure of merit 366. If the same ride had been accomplished with the engine of the 2½ h.p. Singer, 69 bore \times 79 stroke, 295 c.c., the figure of merit would have been 364.

A Suggested Formula.

Sir,—Neglecting the friction of machine itself, there are two factors to deal with in comparing the performances of motor cycles on hill-climbs. There is the resistance due to weight and the air resistance.

The resistance due to weight is the total weight of machine and rider multiplied by the vertical distance through which weight is lifted, and the power required to overcome this resistance varies directly as the velocity or inversely as the time taken. If this were the only factor dealt with the

A.C.U. formula $\frac{W}{C \times t}$, or its inverse $\frac{C \times t}{W}$, would be perfect for comparing performances.

Air resistance varies as the square of velocity, and the power required to overcome this resistance varies as the cube of the velocity, and a figure of merit for this factor alone

would be obtained from $\frac{Ct^3}{A}$, where A is the area exposed to direction of motion. We can thus obtain by combining

the two factors of weight and air resistance a figure of merit,

$\frac{Ct}{W} + K \frac{Ct^3}{A}$, where K is a constant, or, if we assume that

A will be proportional to W , we get figure of merit =

$\frac{Ct}{W} \left(1 + \frac{t^2}{K} \right)$ where K is a constant to be found by

comparison of results and depending on length of hill-climb

and gradient. For the gradients generally used for hill-

climbs it will be found that if $K = \left(\frac{L}{22} \right)$, where L is

length of course in yards, a very satisfactory result is obtained.

In the hill-climb quoted in your article of September 21st

the formula would become—

$$\text{Figure of merit} = \frac{C \times t}{W} \left(1 + \frac{t^2}{2500} \right)$$

It is obvious that the proportion of the total power absorbed by the lifting of weight and the air resistance respectively will vary according to gradient. For a steep gradient the power required to lift the weight will be a

EDINBURGH
M.C.C.———

Competition for
the Sharp Trophy,
September 23rd.

Mr. J. R. Alexander, jun., writes :—

"In the Sharp Trophy Competition to-day, consisting of a fast speed contest, a slow test, and a fast hill climb, Indians were first, second, and third, and far ahead of all others. The result was a very close one for first place, my brother winning by exactly one second from myself, and B. Sandeman 7 h.p. Indian being third, somewhere about 20 seconds after. Indian won every class of the competition, I winning the speed test, and my brother the hill climb and slow test, only fifths of seconds between us. Only three Indians were entered (all 7 h.p.)"

"John Bull's" Biscuits.

For winning every class in
the competition—speed test,
slow test, and fast hill climb—

Formulae for Hill-climbs.—

greater proportion of total power than on an easy gradient and *vice versa* for the air resistance, but the relation of amount of power absorbed by weight lifting to air resistance is a matter of observation and experiment by comparing performances of machines of varying total weights, capacity being the same, and of similar total weights but varying capacities.

J.W.

Unnecessary Corrections.

Sir,—With reference to your article on hill-climbing formulae in your issue of September 21st, I should like to correct one statement made on page 977.

The air resistance varies indeed as the square of the velocity, but the power required to overcome it therefore varies as the cube of velocity, just as the resistance due to the gradient (and, probably, that due to road resistance also) is independent of velocity, and, therefore, the power required is proportional to velocity. I do not quite see what you refer to as "frictional resistances on lubricated surfaces." Surely you do not consider the rolling contact of the tyres on the road as of this character? And if you are thinking of the internal friction of the engine, this should not be credited to it as part of its output.

In conclusion, I am strongly of opinion that for important hill-climbs, where skilled calculators are available with slide rules, the formula should contain two terms, one proportional to t , the other to t^3 . The results would take very little longer to work out than on the simple formula, if the constants for the hill were calculated beforehand.

W. WOODWARD.

A Plea for $t^{1.3}$

Sir,—I read with interest your article on hill-climbing formulae, and how you arrive at the formula $\frac{D^2 S t^2}{W}$, but I am of the opinion that this is overrating time (or the speed), and gives an undue advantage to the big power and light rider.

In arriving at a formula the best way is first to investigate the proportion of power used in performing the various functions of propelling a machine up a hill, thus:

1. Weight Raising.

The power required for this function is exactly proportional to speed, or, in other words, the force necessary to lift a weight is constant, no matter what speed the weight is lifted.

2. Wind Resistance.

The power required to perform this function is proportional to the square of the speed, or, in other words, the force necessary to overcome the wind resistance is proportional to the speed. [This is incorrect.—Ed.]

3. Frictional Resistance of Tyres.

The power required to overcome this resistance is probably proportional to speed; i.e., the force is the same at all speeds.

Engine and transmission friction should not be taken into account, as the h.p. formula should give the power given out at the pulley, and the figure of merit formula should only take into account useful work done (see 1, 2, and 3 above) in exchange for work given out by the smallest engine.

To obtain an idea of the relative quantities of power absorbed by 1, 2, and 3, let us take a particular example.

Suppose we have a hill one mile long, average gradient 1 in 12, speed, 35 m.p.h., weight 350 lbs., and a 4 h.p. engine. H.P. absorbed in raising weight, = 2.7 nearly.

Suppose now that the 4 h.p. engine develops 5 h.p. when in perfect "tune" for hill-climbing, then this leaves 2.3 h.p. for wind and tyre resistance. Of this 2.3 probably .5 h.p. at least goes in tyre resistance, leaving 1.8 h.p. for wind resistance. So that, of the 5 h.p., 3.2 h.p. goes in overcoming weight-lifting and tyre resistance.

Now, as we saw above, the power absorbed by weight-lifting and tyre resistance is proportional to speed (and hence to $\frac{1}{t}$), and the power absorbed by wind resistance is proportional to the square of the speed (and hence to $\frac{1}{t^2}$).

Therefore, if weight lifting and tyre friction were the only resistances the formula would be:

$$\text{Figure of Merit (F.M.)} = \frac{W}{\text{H.P.} \times t} \quad (a)$$

and if wind was the only resistance,

$$\text{F.M.} = \frac{1}{\text{H.P.} \times t^2} \quad (b)$$

Now as wind resistance takes only about one-third of the total power, and weight raising and tyres take the remaining two-thirds, we see that formula (a) should predominate over (b), therefore the time t should be raised to a power between 1 and 2 such that (a) predominates. Probably $t^{1.3}$ or $t^{1.5}$ is near the correct value.

As regards the horse-power formula, the cubic capacity (or $N \times D^2 \times S$) favours unduly the short stroke engine, and $N \times D^2$ similarly favours the ultra long stroke engine. To get some value between these two which will be fair to all, the easiest way is to take some root of the stroke such as square root, cube root, or $\frac{2}{3}$ power.

The Edinburgh Club's formula is a combination of the above, viz.:

$$\text{F.M.} = \frac{W}{N \times D^2 \times \sqrt[2]{S} \times t^{1.3}}$$

In some of the hill-climbs the machines have been classified by capacity alone, thus having singles and twins running in the same class, with very satisfactory results.

COLIN H. MACMILLAN.

BROOKLANDS. A portion of the crowd which closely followed the progress of the Hour Race at the recent B.M.C.R.C. meeting.

Occasional Comments 'LXION'

Does the Belt's Angle Vary?

A Droitwich rider sends me an argument in favour of the view that when a 28° belt is curved round a small pulley, its angular section is considerably less than 28° . I think his contention is quite correct, and further that the trade are realising the facts he emphasises, and that the year 1912 will consequently see more novel departures in pulley contours. Most of the belts containing "arches" or other variations from the solid owe their existence to the facts he mentions. The belt makers were once content if they could get their belts to bend over the pulley easily. Now they are seeking to make belts which retain their cross-section round a bend, and as they are not remarkably successful, certain modifications of the pulley are probable.

Tyres for 1912.

As is usual in a hot dry season, complaints about the unreliability of tyres have risen in many quarters. The standard $26 \times 2\frac{1}{4}$ tyre is a compromise, in more ways than one. It is a compromise in price; stronger tyres of the same section can easily be made, but the motor cycle manufacturers cannot afford to fit, and many motor cyclists cannot afford to pay for, costlier tyres. It is a compromise in resiliency; heavier tyres slow the machine, and if fully inflated are bumpy, whereas hundreds of customers want to get the last possible inch of speed out of their jiggers, "mop up" fellow clubmen in social runs, and brag about sending their speedometer needles right round the clock.

Now that outputs are increasing, and the sporty customer is balanced by the steady-going man, it should be possible for all the leading makers to fit really reliable tyres as an option, at a slight extra cost, and to print advice in their catalogues that the heavier and slower tyre is a good investment for all buyers who are not speed merchants.

I find quite a number of riders ignorant that it is possible to obtain a pair of $26 \times 2\frac{1}{4}$ covers, which will easily last through a long season of hard work, and that without more than a couple of punctures. It is the old story of the push-bicycle over again. For years I used to fit the standard covers on my push-bicycle, and sometimes had four or five punctures in a single day. At last I met a man who was using heavy tandem covers, and when I followed his example I got through an entire season without a solitary puncture.

A Silencer Suggestion.

As readers are aware, I have never seen eye to eye with the A.C.U. on the question of silence. Eight years ago I was a bit of an idealist, and I faked up the machine I was then riding till it became practically noiseless at all ordinary speeds. I barely rode it for a fortnight in its unobtrusive condition, for I had a dozen narrow escapes of committing manslaughter. It is by

no means an unmixed joy to drive an absolutely silent car, but driving a gently-ticking motor cycle is far, far worse, for the motor cycle is so tiny that the average pedestrian or cart driver does not see it coming (it looms so small in the tail of his eye), and if he cannot hear it, collisions are bound to become frequent.

At the same time a dead silent motor cycle is a great joy to its owner, especially on the open road, as anybody can discover by freeling down a long grade in a deserted neighbourhood. Silence is especially jolly on prolonged rides, when the continuous burble of a raucous engine for twelve hours is apt to develop a buzz inside the rider's brain, something like the drumming in one's ears that accompanies high fever.

Now here is a solution, which I offer for what it is worth. Why not fit a *threeway valve* on the silencer? In traffic you could then drive with the silencer half open, so creating sufficient noise to give gentle warning of your approach, without becoming a public nuisance. Up the phenomenal precipice, miles from human habitation, you would naturally drive on the free exhaust. And in all ordinary driving you could shut the silencer right up and tick along like a Bee clock.

The Third Toolbag.

One thing I hope to see at Olympia next month is the universal adoption of the third toolbag. The system standard at present consists of two neat little leather cases, arranged pannier fashion on the rear carrier. One of these is already packed to suffocation with the usual toolroll; the other is fairly well occupied by the tyre repair kit, a duster, spare sparking plugs, and belt fasteners.

There are a few other things we all make a point of carrying on long rides, *e.g.*, a pair of valves, a spare inner tube, and one or two smaller fitments which serve as precautions against the failure of the one or two special weaknesses of our machines. At present there is no storage provided for these parts. The present bags cannot be enlarged in size without drawbacks, nor is their enlargement desirable, for the items referred to all need careful packing, and ought therefore to be stored by themselves, lest our testy tempers should spoil the repacking after a road-side stop.

The location of the third bag is a less obvious matter, but there are plenty of possible positions. It might be in front of the steering forks, it might be on the tank top, it might be under the tail of the carrier, it might be in some vacant niche inside the diamond of the frame; but it ought to be provided somewhere, and it ought to include a compartment for the spare tube. Above all, let all three bags be fastened to the machine by a method that eliminates $\frac{3}{16}$ in. or more of bolt end inside the compartment. These bag-ends of bolts cause more torn skin on one's hands than anything I know except cleaning machines which bristle with split-pins when one is not wearing gloves.

**ALWAYS
BEST**

**IN ANY
TEST**

The remarkable performance of the Bat in the Six Days' Thousand Mile Trials is an enduring testimony to the all-round efficiency, reliability, and correctness of design of these British Built machines.

THE BAT ridden by Mr. S. T. Tessier made a **PERFECT SCORE** whilst the Bat ridden by Mr. E. Babbington only lost seven marks, and those through punctures.

BAT—THE BEST ALL-ROUND MOTOR CYCLE.

TO BUYERS

OF SIDECAR MOTOR CYCLES

— we claim the —

CLYNO

— to be the —

BEST PASSENGER MOTOR CYCLE.

This is no idle boast. We have entered a Clyno Passenger Combination in **every** Open Reliability Trial this Season, taking each trial as it came, and not selecting only the easy ones.

REMEMBER THE RESULT! REMEMBER THE AWARDS of the Three Quarterlies, M.C.C. London-Land's End, the Scottish Six Days' M.C.C. Hill-climbing and Brake Tests in Devonshire.

When ordering your 1912 machine, don't forget that the Clyno Sidecar Machine secured the highest award in every one of the above events.

If you buy a Clyno, you will have a machine with a great reputation for passenger work, and which will live up to it. Our whole 1912 output is nearly booked up, and if you want a 1912 Clyno at all, you must order now. Do it now, and become the proud owner of the best passenger outfit to be obtained. You will be the envy of all your fellow sidecarists who have delayed and are too late.

Agents for London (except S.W.): The Service Co., Holborn. For S.W.: The Wilton Cycle Co., Victoria.

CLYNO ENGINEERING CO., Pelham St., WOLVERHAMPTON.

Another Appreciation of the ROVER

Dear Sirs,

I am writing to express my satisfaction of Rover Motor Cycle that I bought from you about a month ago. I have been running the machine almost every day over all conditions of roads, and have found it most satisfactory. On hills it is perfect; I have not put the machine to any hill but what it would take easily. I think it very good considering it is only $3\frac{1}{2}$ h.p., and I myself being a heavy man, a large side-car, and fairly heavy passenger. I have run the machine nearly 300 miles, and have only had to tighten up one nut.

I think the Rover far superior to any other make.

Yours faithfully,

A. P. LANGFORD.

The Rover Co., Ltd.

THE ROVER CO., LIMITED,
COVENTRY.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Motor Cycle or Tricar for Colonial Use.

Will you advise respecting a machine suitable for the F.M.S.? I place reliability first, as we have few repairers, and those Chinese. Do you consider the A.C. a good, reliable machine and suitable for colonial use? Please give the makers' address.—A.W.

If you go in for a motor cycle we should recommend a single-cylinder $3\frac{1}{2}$ h.p. magneto ignition, but if you decide upon a sociable you cannot do better than get the machine you mention. The address of the makers is, Auto-Carriers, Ltd., Martell Road, West Norwood, S.E.

Two Sparks or One.

Can you tell me whether two sparking plugs in a single-cylinder taken off the one terminal from plug to plug gives two sparks in cylinder or only one? Also whether it is likely to damage the magneto.—G.P.H.

Two sparking plugs in a single-cylinder will not give two sparks unless one is a double pole plug. No damage will accrue to the magneto.

Overheating.

Would it help to obviate the overheating of my engine if I fitted a larger pulley to raise the gear ratio to $4\frac{1}{2}$ to 1, and a smaller jet to my B. and B. carburetter?—E 808.

We should recommend you to try a smaller jet (you can get a set of four in a case from Messrs. Brown and Barlow for 2s. 6d.) and an adjustable pulley. You will then be able to try various gears, but remember that too high a gear is as likely to cause overheating (over-loading) as one which is too low.

London to Glasgow.

(1.) I am thinking of motoring ($3\frac{1}{2}$ h.p. machine) from London to Glasgow, and your assistance with regard to the best road, avoiding as far as possible large towns, will greatly oblige. (2.) Will you kindly suggest a suitable road map?—A.S.D.

(1.) The route you require is as follows: London via Great North Road to Hatfield, Biggleswade, Stamford, Grantham, Newark, Doncaster, Leeds, Skipton, Settle, Kirkby Lonsdale, Kendal, Penrith, Carlisle, Lockerbie, Beattock, Crawford, Douglas Mill, Hamilton. (2.) We should advise you to get "The Motor Cycle Route Book," 1s. 8d. post free from 20, Tudor Street; the Michelin Guide, 6d.; and the necessary Bartholomew maps.

Date of Engine.

Early this year I bought a motor cycle, and was told at the time that the engine was a 1910. I examined it and found everything in fine condition and showing no signs of wear. After using it two months I bought a passenger machine, and wishing to sell my solo mount, I advertised it in your columns as a 1910 engine, which I fully believed it to be. It was eventually bought by a local man after he had seen its running capabilities and seen the engine taken down, and found everything to his satisfaction. I had a remarkable letter from him the other day, in which he says: "I have written to makers of engine and they tell me that it is a 1909 model and not a 1910 as you stated. You must refund the money paid and remove motor by Saturday or take the consequences." The machine being sold in perfectly good faith, would you be good enough to tell me what would be the best thing to do under the circumstances? If he brought an action

would he stand much chance of winning it?—DU 65.

Our legal adviser writes as follows: As unfortunately the mistake was made of advertising the engine as a 1910 model instead of a 1909, the purchaser would have a right to return the machine unless he has kept it and used it for any considerable time. If he has used it so much that it would be unfair to return it, then he has a right to claim damages on account of the misrepresentation, the amount of damages being the difference in value between a 1909 engine and a 1910 engine having regard to its being second-hand. He can claim this, although the misrepresentation was made quite innocently. On the other hand, your correspondent can claim damages from the party from whom he purchased the motor cycle, provided he can prove to the satisfaction of the court that he was informed at the time he purchased it that the engine was a 1910 model. His best plan would be to write to the person who sold the machine to him explaining the present position.

AMERICAN POLICE OFFICERS ON THEIR TANDEM-SEATED MOUNT.

Nearly every large city in the States has its motor cycle mounted police. The above 7 h.p. free engine Indian, built to carry two officers, has just been added to the Cincinnati police department for the suppression of furious driving by motorists. It carries a miniature searchlight for reading identification numbers in the dark, and, of course, a speedometer.

Valve Timing.

Q (1.) Which of the following valve timings will give best results with my 2½ h.p. Minerva? The opening of valves is reckoned from the time they begin to lift until they are dead on their seating again. If, in example 2, the inlet closes too late, I might shorten the tappet a

EXAMPLE 1. I = inlet; E = exhaust.

EXAMPLE 2. O = opens; C = closes.

little, but, of course, this would make it open later. I cannot alter the inlet without the exhaust as they are both on one camshaft. (2.) If I fitted a magneto, would the improved spark increase the power of the engine sufficiently to make up for the extra power required to drive the magneto? (3.) What gradient should the average 2½ h.p. climb, with 26in. wheels geared 5 to 1? Weight of machine 140 lbs., and rider 11 stones.—J.T.

(1.) Of the two methods of timing mentioned in your letter we should prefer No. 1. In the case of No. 2 the inlet valve opens rather too late. We should not, under any circumstances, advise you to shorten the tappet. (2.) Fitting a magneto might improve the running slightly, though as regards actual speed tests the magneto has been shown not to be in advance of the plain coil, but as regards reliability it scores heavily. (3.) About 1 in 8

Licences and Registration.

Q I have recently purchased a 2½ h.p. motor bicycle, and am absolutely ignorant as to what licences I shall require. The machine is second-hand, and was previously registered in Warwickshire. Would you be so kind as to give me full particulars how to get them and the cost, etc.—H.E.

You will require—(1.) Driver's licence, 5s., obtainable from the County Council; this you must always carry with you when riding. (2.) Inland Revenue licence, 20s., obtainable from post office. (3.) The registered number must be transferred to you (fee 1s.); apply to the clerk of the County Council of Warwickshire. You can if you wish obtain a new number from your own or any other county council, but this will cost 5s.

Kent to Yorkshire.

Q I want you kindly to oblige me with the best route to get from here (Ashford) to Leeds. Shall I come in contact with any noted hills, and are there any police traps?—N.S.L.

Your route will be as follows: Ashford, Maidstone, Chatham, Gravesend (terry 4d.), Tilbury, Romford, Waltham Cross, Ware, Huntingdon, Stamford, Grantham, Newark, Retford, Doncaster, Pontefract, and Leeds. Notices of police traps are published from time to time in *The Motor Cycle*, and a police trap map appeared in *The Autocar* for July 29th. There are no bad hills.

Liability of Local Authorities.

Q I was motor cycling from Morecambe to Manchester, leaving Morecambe just before 1.30 p.m. and arriving at Bolton about 4 p.m. At Kearsley, knowing the condition of the roads to be usually bad, I slowed down, and was not exceeding 15 or 16 m.p.h. At this part (the main road between Bolton and Manchester) the electric tramcar posts are in the middle of the road, and there is only a single tramcar track, which is on the left-hand side of the road when journeying from Bolton. A tram was coming from the Manchester direction, and I was prevented from going between tram and kerb by another vehicle, and so obliged to cut between two electric posts on to the other side of the road. This part of road seems to have been paved in two instalments, a ridge standing up from nothing, perhaps to six inches almost, showing junction of two parts. I was unable to pull up before striking this ridge, and was badly thrown, knocking my shoulder out and badly lacerating myself generally. I wrote to

the Clerk, Urban District Council, Kearsley, notifying him that I should instruct my solicitors to claim damages as soon as they could be assessed. He replied as follows: "We are not the Highway Authority, and the Highway Authority is not liable for non-repair of roads." I shall be obliged if you will advise me.—R.B.

Our legal correspondent writes: "In reply to the point raised by your correspondent, I think that the whole question turns upon the point as to whether the ridge was caused, as 'R.B.' suggests, by the road having been constructed in two sections, or whether it was caused by a sinking of one portion of the road. In the former case, your correspondent, if he were riding cautiously, has a good claim for damages against the local authorities, as their carelessness in forming the road amounts to a misfeasance, which is a good ground for an action. On the other hand, if the ridge was not caused by any fault of the authorities, and they merely made default in repairing the road, your correspondent has no right to damages. Upon ascertaining the facts with regard to the cause of the ridge, 'R.B.' should instruct his solicitors."

EXPERIENCES WANTED.

"G.P.L." (Gosport). 7-8 h.p. Matchless and sidecar with twin belt drive and Matchless two-speed gear. Also the 7-8 h.p. Bat and sidecar with P. and M. gear. "P.H." (Truro). 3½ h.p. Lincoln Elk. "F.E.R." (Lincoln). 1911 Rover or Rudge. "R.T.L." (Belford). Rom combination non-skid and Kempshall tyres. "G.E.T." (Leeds). A.C. tricar. "P.G.J.G." (Bristol). Scott with and without sidecar.

MARRIED COUPLES WHO MOTOR CYCLE.

Mr. and Mrs. Jones, of West Bromwich, whose mounts are a two-speed Douglas and a two-speed Fex. This is the way they usually tour *en famille*. Observe the additional stay from sidecar to front tube which gives greater rigidity, and the owner further considers it relieves the front wheel forks of a good deal of strain.

THE MOTOR CYCLE OF TO-DAY IS THE LIGHTWEIGHT *and the Lightweight of Lightweights is* **MOTOSACOCHE** **FOR GENTLEFOLK** **NO VIBRATION** **NO OILY DIRT NO NOISE NO GYMNASTICS**

We do not rely upon words to impress upon the public the superiority of the Motosacoche as a mount which combines reliability, general handiness, low cost of up-keep, speediness, and light weight. Actions are more impressive than any number of words. Remember what the Motosacoche did in the Scottish Trials (3 gold medals in 1910 and another one this year). Remember also the numerous other medals and cups which we have won.

MAKE A NOTE TO SEE US AT OLYMPIA.

Footrests fitted if desired.

LETTERS EDITOR

TO

THE

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Locking the Low Gear in Engagement.

[5919].—Could you or one of your readers tell me a simple way of locking the low gear pedal of a Rex two-speed gear (Roc licence) to enable me to mount without much exertion?

F. CHAS. B. LLOYD.

A Personal Explanation.

[5920].—I am very sorry to say that I have heard several rumours lately to the effect that I am a trade rider. This being untrue, I want to make it clear, once and for all, that I am an official of the Birmingham Corporation Electric Supply Department, and that my only trade interest is as the patentee of the C.A.P. carburetter.

I ride my own machine simply for the fun of the thing and because it is the best form of sport I know, and in competitions, I pay my own entry fees and expenses.

HAROLD J. COX.

The New Brighton Track.

[5921].—Referring to the letter from Mr. Baxter, appearing in your issue of the 21st ult., there are several points to which I should like to reply.

He states that he holds the speed record for the New Brighton track, viz., 57 m.p.h. I might add that on Tuesday, July 4th last, I attained a speed of 60 m.p.h. on my 7 h.p. Indian. The same morning I equalled his mile record for the track, which, I think you will agree, was fairly creditable, when I tell you that the machine in question had been driven about 1,500 miles (200 miles the previous day with a sidecar), and the engine had never been touched or tuned up in any way. Gear employed, 4 to 1.

I shall be pleased to meet him on the track any time I am at Liverpool again for a friendly contest. I consider the track a very dangerous one, particularly on the north end.

J. N. NEWMANN.

Partial Air Lock in Tank affecting Hill-climbing.

[5922].—My 1911 T.R. Triumph has not until recently shown up particularly well in climbing long, stiff hills, a deal of juggling being necessary to get up some that it should take without difficulty. Naturally, I was anxious to discover the reason for this, and, as I think I have found it, send you the result for the benefit of others.

I believed the poor results obtained to be due to a shortage of petrol, although the carburetter appeared to flood readily, and after making sure all carburetter passages were clear turned attention to the tank. The cap, as is known, is a good fit, provided with a leather washer, and the same fitted with a small hub lubricator and release. Examination of this release reveals a very fine hole indeed, one which immediately struck me as being too small. At once I enlarged this, and the results on the same description of hill as above were wonderfully improved. However, I thought one might go a step further, and therefore, by way of experiment, I unscrewed this lubricator and fitted in its place an ordinary Dunlop tyre valve, by the use of which it was possible with a few strokes of the pump to secure and maintain in the tank quite a good pressure. Anxious to note the effect of forced fuel feed the machine was tried on several hills on which previously it had behaved erratically, and the results were astonishing. It would take air as it had never done before, and simply roar over the ground up hill. I would advise all to see that a partial air lock does not occur in their tanks. Many, I am perfectly certain, will find that attention to this point will well repay them.

In fitting valve screw up from underneath side of tank cap and use seccotine to make a good joint.

T.R.T.

Stands as Nail Catchers.

[5923].—Let me offer a word of warning to any of your readers who may be tempted to follow the advice offered in letter No. 5853. Unless the rear bar of the stand is quite close to the tyre nails would pass untouched, and that is where the danger comes in. I recently adjusted my kick-up stand so that it cleared the tyre by about half an inch. Shortly afterwards, while travelling "somewhere near 20 m.p.h." the bar happened to touch the tyre. In the fraction of a second the bar was dragged over the wheel and came to rest on the rear forks, breaking both mudguard stays on the way. I was fortunate enough to prevent a spill, although a 40ft. mark on the tarred road showed where my locked back wheel had skidded.

NEVER AGAIN.

Variable Gears for Cornwall.

[5924].—As I live in the hilliest part of North Cornwall, it was with great interest I read Mr. C. E. Stuart's letter in your issue of August 31st. I quite agree with all he says as to the advisability of having a two-speed gear on a 3½ h.p. machine for touring in Cornwall. Long steep hills with bad corners abound in all parts of the county. With a good 5 h.p. twin it is possible to slow down for these bends and then accelerate again when safely past. The best 3½ h.p. single-speed machine is, however, likely to fail—unless it be geared absurdly low—when slowed down sufficiently to negotiate a bad corner on a 1 in 6 gradient. This is more than ever likely to happen if the hill is taken unawares on the run with the engine already hot. If, on the other hand, the machine is fitted with an efficient change-speed gear, it should be fairly easy to climb the steepest hills and negotiate the worst corners. The addition of a clutch makes it possible to get a re-start, even if stopped on a bad gradient. I ride a 1911 free-engine Bradbury with fixed gear. It gives me the greatest satisfaction and notwithstanding my remarks, I would not wish for anything better or for the addition of a two-speed gear. This no doubt seems paradoxical, but there is all the difference in just touring through a district and living in it always, especially if it be very hilly. On the one hand steep hills and awkward turnings come all unexpectedly, and in the other case the rider who lives in the district knows every inch of the ground, and how the various inclines may best be surmounted. If a long steep hill comes in the run, the rider will traverse the few previous miles at a lower speed and so allow his engine to cool down. He also knows when best to lubricate, and from what point a hill may be rushed with safety. Attention to matters like these enables a motor cyclist to complete a day's run in a hilly country without a stop, where another equally good rider on a similar machine would fail, simply through not knowing the road. Speaking personally, I find it possible to climb any hills if only I can get a run at the bottom. Even with a 4½ to 1 gear on a gradient of 1 in 6 the machine will climb a very considerable distance before the speed perceptibly slackens. This I attribute to the exceptionally large flywheels with which the Bradbury is fitted.

FRANK F. WARD.

Why there are few Motor Cycles in Germany.

[5925].—I noticed some time ago a question in *The Motor Cycle*, "Why are there so few motor cycles in Germany?" Well, here are my experiences. I wanted to get a licence for a machine coming out from England from a dealer. I went to the police court and asked for one. "Had I passed my medical examination yet?" "No, I had not." So up I had to go to be tested by the prison doctor for hearing, sight, heart, and chest. I came back to get the licence, but

no, I would have to get the motor cycle examined by the expert (official) to see whether it was safe or not (a Triumph, too!), at the same time to see that I was telling the truth about the cylinder capacity.

Then I had to find out the date, number, trade mark, name, and outstanding particulars about weight, etc., for the engineer, and also I had to fit a filter in the petrol-filler ("to keep the tank," as he explained, "from exploding!"). I also had to fit a brass plate with the make of motor cycle, name and address of makers, number of machine, horsepower, weight, and my own name and address. This, of course, all at my own expense. Then I came back to get the licence. No, not a bit of it. "Had I passed my driving tests?" "No? Well, go and be tested! Here is the address." I returned again, and had all my paper forms, certificates, etc., ready. I thought my troubles were over. No; I had to send for my birth certificate. That produced, I had to go next day to the customs house and pay. Four days after I received notice to drive up to the police station, and on arriving there the machine got another final look over; and that is all. The licence is "won."

Now, would anyone walk into this with his eyes open, unless he were really fond of the sport? I do not know how long this law has been in operation, but it makes you appreciate the freedom of England in comparison.

While talking about freedom, they add insult to injury by putting your letters H(A). H means "Hansa Stadt"! "Free town"! Ye gods! Needless to say, the town is not absolutely crowded with motor cycles. J.M.

Broken Piston Rings.

[5926.]—With reference to the correspondence in your columns on the subject of broken piston rings, I have had two cases this year of the ends of "step" rings breaking off. In the former case both "steps" were gone, and examination failed to reveal any traces of them. In the second case, the broken "step" fell out when I removed the cylinder. It was reduced to a rounded and polished piece of metal not more than half its original size; and this after running only very few miles.

In neither case did the cylinder show any signs of scoring.

BARAK.

The Dangerous Dog.

[5927.]—The various suggestions for the discomfiture of the inquisitive dog which have from time to time appeared in *The Motor Cycle* seem to show that the old-fashioned plan of telling the dog to go home has not been tried as much as it deserves. Nine dogs out of ten will obey sufficiently to let the motorist go in peace.

To those who find that they often meet the tenth dog, I would appeal not to squirt chemicals at him; firstly, because they run a good chance of injuring the dog's eyesight, which none with a spark of humanity would care to do, and secondly because they are morally certain to raise a good deal of prejudice which could quite well be done without. A long cane, or at a pinch a cycle pump, is quite an effective deterrent, and it has the advantage of being understood, and indeed used by the British public.

D. S. HOLMES.

The Camaraderie of the Road.

[5928.]—On Sunday evening, September 17th, I was driving with two ladies in my car through the ten-mile limit on the narrow and tortuous road between Pevensy and Bexhill, when another car, driven recklessly round a corner, forced me into the ditch as the only alternative to a collision. The offending car went on, but later two owner-driven cars came on the scene and stopped to render assistance, as did also a gentleman who was driving a motor bicycle and sidecar with a lady passenger. All worked manfully for quite an hour before my car was extricated, and I regret that the motor cyclist, having done his share of the hard work, rode away before I was able to thank him. In the hope that he may see this letter, I write to convey my grateful acknowledgment of his valuable help. It was dark when we finished, and I fear he was much inconvenienced by the delay. I should be sorry if he thought that his kindness was not appreciated.

W. P. BLOOD (COLONEL).

The Margin of Safety in Sidecar Axles.

[5929.]—In view of the recent fatal accidents caused through sidecar axle spindles breaking, we should like to call your attention to our remarks on sidecar spindles in enclosed pamphlet of our sidecars, printed at the beginning of the year. The spindle to be avoided is the one with a cone screwed on at the big end. The action of cutting a thread at this end of spindle, where all leverage takes place, is like putting a diamond across a sheet of glass.

Also this type of spindle is not made of drawn steel, but a stamping, very soft and spongy. These spindles are still being made and fitted to sidecars, carrying two people in some cases, and are only fit for a push bicycle. A word of warning and description of spindle would undoubtedly be the means of saving one or two lives, to say nothing of numerous accidents.

A. L. MIDDLETON AND CO.

The reference to axles in the pamphlet reads: "If a sidecar was to be taken over a rough road at 20 miles per hour, by a 3 h.p. machine, it would probably break up—in fact, we are certain, *with one or two makes, that the hub spindle would first bend and then snap off.* Our spindles are proof against this, and are guaranteed to stand all road shocks. They are turned from solid bar Bessemer steel, with special steel cone at big end driven on, *not screwed.*"

Silence.

[5930.]—I think the abuse of motor cyclists who have to use their cut-outs, which appears in your columns week after week, is quite too bad, and now a "Quiet Person" tells us he would give us "hard labour without the option." This is surely writing with a scratchy pen.

There is a why and wherefore in everything, and the reason why I and hundreds of other motor cyclists often ride with cut-out open is certainly a good one—our cycles like it, often demand it.

My cycle, 1907 pattern, is frequently referred to as "the best make of English cycle," and it certainly is a grand machine for its age. No doubt the latest pattern cycles are much more silent, but I for one do not purpose getting rid of my old mount for that reason only; also if sold it would still be ridden, possibly for many years to come. Or do the enemies of the old models suggest that they should be scrapped? Of course, quietness of running is very desirable, but in practice quite impossible with every motor cycle; also it should be remembered that the chief sufferer from a noisy cut-out is the rider himself. The annoyance to other people must be very little, and certainly does not justify the unreasonable remarks of many of the "silent ones."

E. W. KNIGHT.

Suggestions for Improving the Six Days' Reliability Trials.

[5931.]—I am glad to observe that Mr. Pratt practically endorses the suggestions I made in my previous letter for the carrying out of next year's Six Days' Trials, but I cannot agree with him that several official cars should ride amongst the competitors. Those who took part in this year's trial will remember the appalling dust clouds created by the competitors, and to have several cars driven amongst them would render the competition very unpleasant and dangerous. I think a better suggestion would be to abolish the minimum and maximum speed business, and instead to have one car just in front of the first competitors which no competitor would be allowed to pass, this car to set the speed according to the conditions, and in no case to exceed, say, thirty miles an hour. This would abolish the scorching which took place in this year's trial. And another car to follow at a reasonable distance behind the last competitor, which no competitor would be allowed to get behind except for tyre troubles. If the following car had a few observers mounted on motor cycles attached to it, whose duty it would be to stay behind with any competitor who fell behind to see that he did nothing to the machine—then with the toolbags sealed and a course like the Harrogate one we should see fewer gold medals. As matters stand at present gold medals are far too easily earned, and are no criterion of a machine's reliability, as witness the fact that several gold medal winners had endless mechanical troubles this year, but were able to make up the time lost in executing repairs by scorching. The public look to the Six Days' Trials for guidance in selecting their next year's mounts, but a better guide would be to study the second-hand columns of *The Motor Cycle* and carefully note the depreciation of the various machines.

ERIC W. MERRALL, Assoc. M.Inst.C.E.

"HUMBER"

LAST FEW DAYS

of our MAMMOTH SALE.

We have the following bargains still left. SNAP ONE. CASH OR EXTENDED PAYMENTS.

1909 P. & M., guaranteed, almost new (no exaggeration)	..	£37
1909 5 h.p., REX DE LUXE, 2-speeds, free engine	..	£28
Or with new sidecar	..	£34
1910 3½ h.p. SCOTT, and coachbuilt sidecar	..	£45
6 h.p., BAT-JAP and Bat sidecar	..	£30
1911 3½ h.p. T.T. PRECISION-SERVICE, almost new	..	£35
1909 3½ h.p. ARIEL, variable gear, magneto	..	£25
1911 3½ h.p. REX (soiled)	..	39 gns.
1911 2 h.p. HUMBER (soiled)	..	£3
1911 3½ h.p. PRECISION-SERVICE, 42 guineas, reduced to	..	39 gns.
1910 5 h.p. REX DE LUXE, 2-speeds, free engine	..	£40
1910 2½ h.p. ENFIELD (khaki colour), almost new	..	£27 10
1909 2½ DOUGLAS	..	£23 10
3 h.p. SINGER, Bosch magneto	..	£17
1911 3½ h.p. free engine SINGER, hardly soiled, cost £55	..	£45
2 h.p. HUMBER LIGHTWEIGHT, shop soiled
1908½ TRIUMPH, with 1911 Mabon gear	..	£32 10
1910 5 h.p. REX	..	£35
1910 3½ SCOTT, 1911 forks and improvements	..	£42
1910 3 h.p. TWIN-WANDERER, spring frame	..	£27 10
Etc., etc. Full list now ready, post free.		

TRIUMPH

3½ h.p. 1911 BRADBURY, shop soiled.

**1911 Free Engine TRIUMPH, and
2-speed DOUGLAS in Stock.**

1909 2-speed P. & M., with new sidecar .. £44
3½ 1911 T.T. BRADBURY, shop soiled.

**IMMEDIATE DELIVERY, 2-speed
CLYNOS, £14.**

1909 T.T. TRIUMPH, lamp and horn .. £33

1911 P. & M.'s in a few days.

1910 5 h.p. INDIAN, lamp and horn .. £37
1911 2-speed HUMBER, almost new .. £41

SERVICE SIDECARS fit any machine, have quick detachable joints, and are complete with apron and cushion, £6 6s. A few, soiled, to clear at £5 17s. 6d.

Will customers contemplating purchase of 1912 machines kindly communicate with us if they have not already done so.

This is the BROOKS B130—

a saddle which is eminently suitable for the Lightweight Motor Cycle. It is made in two sizes, and is exceptionally low-built, its height being only 3½ in. in the one size and 3 in. in the other.

—this, the BROOKS B104

is a perfect saddle of great strength and comfort. It is made of the finest materials throughout and is very popular among Motor Cyclists the World over.

—and this, the BROOKS B250

is a most luxurious seat for motor cycles of the non-peddalling type. It is low-built, and the leather top is beautifully moulded to shape and of extremely comfortable proportions.

All the above embody that exclusive feature—the BROOKS Patent Compound Springs—the springs that ensure unequalled comfort and make the roughest road vibrationless. These, and other models, are fully described in the Motor Cyclist's edition of the BROOKS BOOK, as also the many Tool and Touring Bags which bear our name—may we send you copy?

J. B. BROOKS & CO., LTD.,
49, Criterion Wks., Birmingham.

Samples of all BROOKS Saddles and Cycle and Motor Cycle Accessories may be seen at our London Showrooms—11, Grape Street, Shaftesbury Avenue, W.C.

Will Hill-climbs Survive?

[5932.]-They certainly ought to. If enterprising garage men up and down the country, are prepared to give prizes and provide suppers for competitors, long may the hill-climb survive to grace the sweet uses of advertisement.

ARTHUR T. MILLS.

Lamps. Belt Slipping.

[5933.]-I see "Ixon" complains of the poor light he gets from his modern lamp. I experienced exactly the same trouble from a small car lamp I fitted on front support of sidecar. If "Ixon" adjusts his flame to the exact centre of reflector I think he will find lamp quite satisfactory. My experience is that a large proportion of lamps are sent out without being properly adjusted. With an ordinary metal parabolic reflector it does not seem of so much consequence, but with a Mangin lens a very slight error makes an enormous difference to the light.

By the way, have any of your readers been troubled with belt slip on wheel pulley? I had a lot of trouble on a recent run, the machine sticking on several hills. There was no symptom of slip on engine pulley. Both pulleys are correct angle and in line.

H. W. SYMONS.

Flexibility Hill-climbs.

[5934.]-I read "Ixon's" notes on the above subject with great interest, as my club organised a very successful flexibility hill-climb this season which, though not most popular, was the most enjoyable, in my opinion, of all the competitions we held. We only ran one class, the greatest difference in time to win, no adjustments between the fast and slow climbs being permitted. We ran the slow climb first because, had we done the reverse, some wily rider might have essayed the fast climb on a new belt, the resultant stretch coming in very useful in the slow climb.

It is rather interesting to note how different methods of arriving at the winner give different results. For instance, at first sight it might be supposed that if one took the difference in time, it would give the same result as taking the difference in speed. This is not the case, however, as will be seen from the following example:

Theoretical hill, one mile long.

"A" machine. Fast ascent 10 m.p.h. = 6 minutes.

Slow ascent 5 m.p.h. = 12 minutes.

A difference of five miles per hour in speed and six minutes in time.

"B" machine. Fast ascent 60 m.p.h. = 1 minute.

Slow ascent 20 m.p.h. = 3 minutes.

In this case there is a difference of no less than forty miles per hour in speed, but only two minutes in time, and "A" machine wins on time, though there is no doubt that "B's" is the better performance.

Probably, the formula $\frac{\text{time occupied in slow climb}}{\text{time occupied in fast climb}}$ would give as accurate a result as any.

E. M. OLIVER.

Hints on Dismantling the N.S.U. Gear.

[5935.]-Having just read "Hints and Tips" No. 376 from *The Motor Cycle*, on the N.S.U. two-speed gear, I think my experience of this gear may be of interest to you. I have used one for two and a half years on a $3\frac{1}{2}$ h.p. machine, and another for two years on a 6 h.p. cycle. In both cases the following remarks apply: The complete dismantling of the gear is, with a little care, one of the simplest jobs imaginable when once the diagram is studied, although I managed it without any such help. The special tool I made myself of four inches of piano wire $\frac{1}{16}$ in. thick bent so  The ends are slipped into the small holes above the clutch spring and the spring cap simply unscrewed by the key provided. Then by placing the end of the hammer-shaft on top and pressing down from one's chest, the special clip can be slipped out and the clutch spring lifted out.

As to taking down the back of the gear, this is simply a matter of (1) loosening the r.h. screwed ring or fan pulley to the front of the gear, (2) loosening the l.h. screwed ring below this towards the back of the gear until the grub screw is revealed, (3) withdrawing this latter, and (4) unscrewing (l.h.) the front portion from the back or driving belt pulley portion of the gear. This last operation is only necessary when a new belt pulley is required, but the clutch I find must be taken out for oiling purposes every 500 miles or

so. The wire and spring need not be taken out unless required, but will all come away with the clutch on taking off the spring cap. When off, I press into the back part of the gear a quantity of thin grease, and also smear a good supply of thick oil and sifted blacklead all over the clutch and its plates. The gear I then find runs perfectly without further attention for perhaps over 500 miles.

If proper care is taken of it, this will prove a most reliable and efficient gear, but it has its faults. These are: (1.) If over oiled it spurts oil all over the machine (and on one's trousers). (2.) If allowed to get dry, the clutch begins to engage too fiercely. (3.) The low gear does not stay engaged for long if it is left to itself. (4.) At high speeds the clutch slips on the high gear. (5.) It is apt to get out of truth on the crankshaft. I can, however, most heartily recommend the gear as one of the best on the market as far as I know, and I have given it a good trial!

JAS. T. G. PHILIPS.

Standardisation of Tyre Rims.

[5936.]-In a recent article you announced that at last standard rims for motor cycles had been agreed upon, and it is a matter of congratulation for the Manufacturers' Union to have helped in attaining this result.

The published illustrations of the new sections of these rims have the same sharp edge inside which is responsible for a great many tyre bead defects. As many motor cyclists have suffered from head troubles more or less, I am surprised that the rubber manufacturers whose names are given in connection with this matter should not have proposed a more suitable pattern. It is evident, and many motorists will agree with me, that this sharp edge must damage the tyre sooner or later.

I have for some considerable time been using a flat base rim with great satisfaction. The ends are nicely rounded, and take a larger and consequently much stronger bead. I am also assured by one of the few tyre makers who supply these rims with their tyres that as the inside distance between the two beaded edges of the rim is greater, it is possible to make covers "four-ply," which is practically out of question with the narrow rim.

Through the use of sidecar carrier seats, additional strains are placed on tyres, and this matter should have had more consideration. I hope it is not too late for the makers to reconsider the rim question. Since I have used the flat base rim, I decline to go back to the old pattern, as I find I get better satisfaction and no head troubles.

LE 219.

Sidecars and Change-speed Gears.

[5937.]-I would like to add my testimony to the efficiency of the $3\frac{1}{2}$ h.p. single-cylinder for sidecar work. I have a 1910 Triumph, fixed gear, which I have used continuously, and which has proved invaluable to me in my profession of a music hall artiste. My partner and myself always use it when playing more than one hall nightly in London, and it has never yet let us down, even when having no time to spare for adjustments in working such turns at East Ham and Walthamstow, Woolwich and Poplar, Rotherhithe and Shoreditch, etc. Although I have no change-speed gear, it is very seldom that I have to drop my passenger on a hill. Recently we rode from Plymouth to London in a day without getting stuck on a hill, not even the teaser into Shaftesbury, although it is hardly necessary to add that a few vigorous strokes of the pedals were necessary.

Our last and longest journey was from Portsmouth to Sunderland—345 miles—which we accomplished in two days without an adjustment of any kind. On the Sunday we rode from Portsmouth to Retford, 216 miles, and on Monday to Sunderland, another 139 miles. The only time that I have any desire for higher power is when we strike a really strong head wind. There are, of course, some occasions on which I long for a change-speed gear, but they are very few. If only it were possible to fit the Gradua gear! Tyre troubles are practically the only ones we have, and we have been through two hours' continuous downpour, which soaked through our clothes to the skin, and my Service belt never showed the slightest sign of slipping.

I need scarcely trouble to add the usual disclaimer, but to judge from the tone of some correspondence on the subject one would imagine that a big twin was absolutely essential for any serious passenger work.

CLIFF LAKE.

[5938].—I cannot endorse your correspondent's remarks as to the necessity of a high-powered motor for a passenger machine. Many are evidently now considering the purchase of a sidecar machine, and as to whether the additional expense of running a twin, with extra complications over the single cylinder, is worth while, and probably my holiday experiences may be of some guidance or assistance. Last year I ran a $3\frac{1}{2}$ h.p. with sidecar, of perhaps the most widely known make, but as the manufacturers would not fit a two-speed gear (which I consider absolutely necessary), I this year purchased a $3\frac{1}{2}$ h.p. Zenith and Montgomery spring-wheel sidecar, receiving delivery two or three days before my holiday. My weight is 14 stone, and that of passenger over 10 stone. We made for a little village four miles from Burford, Oxon, climbing *en route* Warmington Hill. Making this village our centre, we toured the neighbouring country in various directions, averaging from 20-80 miles per day. Such hills as Quarry Hill, Bourton-on-the-Water, Stow-on-the-Wold, Wick Hill, Rissington (an unknown hill between Great Rissington and the Merrymonth), and many others, were easily overcome, and the hill out of Burford was climbed many times. There is a sharp corner at the bottom of this hill, with no chance of rushing, but the little J.A.P. engine ticked merrily away and brought its 24 odd stone to the top on every occasion. A friend who accompanied me on a free engine and sidecar (combined weight of passengers $19\frac{1}{2}$ stone), geared about 5 $\frac{1}{2}$ to 1, stuck on many occasions. When he could rush a hill he usually got to the top, often passing me; but with the low gear in I always got there, and re-passed him sometimes later, if the pace was somewhat slow. But on that grand stretch of road between Northleach and Witney, on top gear, the pace was exhilarating. I dare not state it. We met very few motor bicycles, and no sidecars, except on the Witney Road, and I should like to recommend this as a centre for a holiday, the villages of Swinbrook, Bibury, Slaughter, Churchill, Minster Lovell, Taignton, "The Barrow," and Milton-under-Wychwood being well worth visiting, Burford itself having a grand old church. The ride from Broadway to Stow-on-the-Wold, and on to Chipping-Norton was fine, and from Stow-on-the-Wold to the Merrymonth more so; and if gauged by the few motor cycles seen, little known. The roads were up-hill and down-dale, with little continuous level. I know the Midland district fairly well, and think there are but few hills (which can usually be easily avoided by a slight detour) a good $3\frac{1}{2}$ h.p. will not surmount, but I have no experience of the Scottish mountains.

I have no brief for the Zenith gear, but am certainly a satisfied user.

CONTENT.

A False Paradise in the Lamp World.

[5939].—I have noticed the paragraph headed "A False Paradise in the Lamp World," page 1008 of last week's issue, and should like to point out to your contributor that in all probability the reason for his poor light with the lamp in question is that probably the burner is not properly focussed.

If he cares to let us have his lamp, we think most likely we could so alter the burner that he would have no further complaints. Or if he would like to test a lamp which has been very carefully focussed, we should be pleased to send him a "Gamage." We think he would be astonished at the difference which the proper focussing of the burner makes.

A. W. GAMAGE, LTD.

W. A. VINCENT, Director.

1912 Models.

[5940].—I looked eagerly in last week's issue which dealt with 1912 models for some mention of what I hoped would be the outstanding feature of the new models, viz., handle-bar control to the magneto. There is no mention of it, and there seems every possibility of my hopes being shattered. Why, oh why, will not all makers follow the example set by some companies in this respect? What makes them think of having the control anywhere else but on the handle-bars? Let them realise how impossible it is for their engines to be given satisfactory treatment on rough twisty hills, or in traffic with this important control in such a ridiculous position. Finally, I cannot help thinking what a difference it would make if *The Motor Cycle* would only use its enormous influence in such matters to bring about a change.

GRATEFUL.

[From time to time we have pointed out the advantage of magneto handle-bar control under certain conditions.—Ed.]

The October Quarterly Trial.

[5941].—Attached is a copy of a letter sent to the secretary of the A.C.U. I consider the case is one involving injustice to certain makes of machines, and is a grievance that should be ventilated.

The A.C.U. must cater absolutely fairly for all makes of machines, and whilst everyone knows that it would not make an unfair discrimination consciously, yet it is certainly its duty to do no injustice unconsciously.

In this case, it has done it in the last three trials, and it should be remedied in the October trials.

COLMORE DEPOT,

F. S. WHITWORTH.

[COPY.] September 28th, 1911.

The Secretary A.C.U.

Post Office, London, S.W.

Dear Sir,—We are in receipt of the entry form for the Auto Cycle Union's Quarterly Trial, and we think of entering one or two machines.

We are surprised to find, however, that the two light-weights for which we are agents, Douglas and Enfield, are expected to climb the hills at twenty miles per hour to get maximum marks—other machines of about equal weight, but of 300 c.c. capacity, can get full marks if they climb at fifteen miles per hour. Every machine that climbs the hill may receive maximum marks, but some are mentioned in the report as having climbed more creditably than others; and it is the point that a 300 c.c. single is classed A1 at fifteen miles an hour while a Douglas has to do twenty to be classed as A1; that I consider unfair.

Seeing that in your rules for the T.T. race all these machines were placed upon equal terms, the 300 c.c. singles, and the 340 c.c. twins, we should have thought they would have been placed on equal terms in a reliability trial.

This distinction seems to us to be a very unfair one, and we ask you to remedy the injustice.

We suggest that fifteen miles an hour should be made the standard for all machines that do not exceed the capacity set for the Junior T.T. Race, that is 300 singles, and 340 twins.

COLMORE DEPOT,

F. S. WHITWORTH, Manager.

SUMMARY OF CORRESPONDENCE.

Regarding an observation in a recent issue that a band brake renders a wheel more difficult to detach, Price and Co. point out that their type of band brake does not make it difficult to remove the wheel, as there are no screws to take out, but merely a shackled hook to take off.

Mr. C. C. Cooke, hon. sec. Herts County A.C., writes: "Re 'Ixion's' remarks on Flexibility Hill-climbs in your issue of the 28th ult., 'Ixion' cannot have been at the biggest open hill-climb of the year, namely, that of the Herts County Club at Kop Hill, on May 6th, 1911, with 250 entries. I think *The Motor Cycle* of following date contained full particulars of this event, which included classes for flexibility only."

Three South Devon riders who took part in the open hill climb on Grassed Hill, and who put up a star turn on the two corners near the summit. They are: R. Holloway, A. P. Maurice, and R. Broadbent, all riding 3 $\frac{1}{2}$ T.T. Premiers.

NEW CARBURETTERS: The 1912 B. & B. The Pugh—a new design.

By the courtesy of Messrs. Brown and Barlow, who have just moved into new works at Witton, Birmingham, we were recently favoured with an inspection of the 1912 B. and B. carburetters.

For next year there will be three patterns—the standard lightweight, the standard heavyweight, and the racing model. The specification of the universal types is exactly similar, the difference being one of size and weight. The new carburetter is of the adjustable jet and adjustable main air type, and the variation in the

supply of petrol and air is obtained in the following manner. In the base of the throttle chamber is placed a plug H, which terminates at its upper end in an eccentric mushroom head. This head moves eccentrically over two holes K (one only shown) in the jet tube J, thereby gradually closing and opening the holes, the size of the jet thereby varying from zero to .036, the combined area of the two holes being equal to the jet opening of .051. It will be seen that it is possible to obtain a big variation in the petrol supply, .051 being a very much bigger jet than is usually employed, even for hill-climbing purposes, on a standard 500 c.c. engine. The lever M for controlling the variable jet is keyed on to the eccentric plug by means of keyways and keys cut on the plug and the boss of the lever. Finally the lever is secured to the eccentric plug by a nut and spring washer P, so that by tightening up the nut more or less the correct frictional contact is obtained.

Adjustable Main Air.

The adjustable main air holes E are formed in the base of the throttle chamber, and are closed and opened by a rotatable slide D, which allows the number of holes to be varied from 1 to 8. Supposing that the owner of one of these carburetters wishes to compete in a petrol consumption trial, he would close, say, five or six of the holes in question, turn the lever controlling the variable jet to zero, and gradually open it until the engine was just turning over. So adjusted, the petrol consumption would be very small, but naturally there would be very little power. On the contrary, if he wished to compete in a hill-climbing competition, the air passages would be left fully open and the jet lever placed in the maximum position. With this adjustment the mixture might be too rich, in which case the jet lever would be gradually closed until the correct explosive charge was obtained.

The careful rider asks: How can the jet be removed? Examination of the illustration will show that this is an easy matter. The screw R at the base of the jet tube is taken out, and the jet holes can then be readily cleansed. If necessary, the whole of the float chamber, platform, etc., can be bodily removed by undoing the band clip S, disconnecting the petrol pipe. Provision is made for cleaning the passage from float to mixing chambers by means of a hole L.

Sectional view of jet chamber of the 1912 pattern B. and B. carburetter, which has an adjustable jet controlled by the lever M.

Among the detail improvements to B. and B. carburetters for 1912 may be mentioned: Slides machined from solid D brass bars, keyways cut at the sides of the slides coinciding with pegs in the body of the carburetter; the slides rise and fall truly, and the slides cannot be wrongly assembled, as if a rider attempts to insert the slides wrongly the pegs will not allow them to descend to their correct positions until the keyways are opposite their respective pegs. The same binding screw with a square head is used for attaching the carburetter to the induction pipe, clipping the handle-bar control levers to the bar, and connecting the float chamber to the mixing chamber.

A small pocket spanner is provided which fits the square heads, so that the whole carburetter can be taken apart without the use of any other tool.

The only alteration to the float chamber consists of brazing on the threaded portion U, instead of attaching it by means of a screw and locknut.

Pugh Carburetter.

The special features of the Pugh carburetter (patented) is the duplex spraying jet, which is formed by fitting the nozzle proper into an air cone. This air cone has none of the attributes of a choke tube, but partakes of the nature of an injector, and its action is such that not only can the petrol be raised from practically any level in the jet—experiments having proved it to be possible to spray petrol perfectly with the level five inches and more below the top of the nozzle—but also that the petrol is perfectly atomised, and it emerges from the nozzle in the form of a mist or fog instead of in liquid form. All the air passes through the back of the carburetter, and, passing across the petrol mist created by the sprayer, is

The Pugh carburetter, showing its unusual appearance.

formed into a perfect mixture at all speeds, and the charge enters the engine in the form of gas, i.e., carburetted air.

Owing to the injector action of the duplex sprayer, the question of petrol level becomes absolutely of no account, and the level is set so low in the Pugh carburetter that flooding and consequent waste is impossible.

The Pugh carburetter is fitted with an air control lever, which must be opened only about one-quarter of its range of traverse when starting, but immediately after starting the air valve should be opened to its maximum and left there, all the driving being done on the throttle. It is in practice very rarely necessary to close the air lever.

The rack and pinion handle-bar control is worth mentioning, and the small spring clip on the needle valve (patented). Also

View of interior showing the novel method of atomising the petrol by means of an air cone.

the system of adjusting the Bowden cables, and the fact that the cables may be detached from the carburetter without unscrewing any small nuts or screws, or unhooking or unsoldering nipples.

NEW CARBURETTERS.
STREATHAM CLUB'S OPEN HILL-CLIMB.

FURTHER ADVANCE DETAILS AND
ILLUSTRATIONS OF 1912 MODELS.

Olympia Motor and Motor Cycle Shows.

Arrangements are being made with the various clubs, including the A.C.U., whereby admission can be obtained to Olympia at half price, provided the tickets are purchased through the club's respective secretaries.

October Quarterly Trials.

Motor cyclists living on or near the Quarterly Trials course will be doing a great service to the A.C.U. by volunteering as marshals. Letters should be sent to Mr. Harold C. Pickering, Chief Marshal, Belgrave Garage, 233, Bristol Street, Birmingham.

De Rosier Changes Mounts.

On the 17th ult., at the Riverview Saucer track, Chicago, Jake de Rosier riding a new Excelsior, built especially for him, is credited with making an unofficial world's kilometre record in 23½s., = 96½ miles per hour. The performance was witnessed by 8,000 spectators.

Another Stolen Machine.

A 1910 model Ariel was stolen from a coachhouse at 80, Hill Top Mount, Leeds, on Sunday last. The coachhouse was securely locked and bolted, and the coachhouse gates opened from the inside. The thief cut both panes of glass out of the coachhouse window, also the centre panel of the door, to force an entrance.

The End-to-end Lightweight Record.

On going to press last week we received a telegram signed Merton as follows: 'Beat Land's End to John-o'-Groat's lightweight record by three hours; time, 36 hours 42 minutes.' In the absence of names of any of the checkers or time-keepers, we withheld publication of the telegram pending the receipt of fuller particulars. It will be at once perceived that the time in which the journey is claimed to have been done is three hours better than that accomplished by Eli Clarke on a Douglas, and yet Merton's attempt, of which we were advised beforehand, was made on a 2 h.p. M.R., and during September, when there are nearly twelve hours of darkness. We have since received from Merton some details of the ride, and while we should be the first to congratulate him on achieving such a record, we cannot help feeling more than a little sceptical about his claim, as in no instance does he inform us where he stopped, whom he saw or met until he arrived at his destination, when he pays a tribute to the kind welcome he received from Mrs. Calder, landlady of the local hotel.

A Sensible Recommendation.

A fortnight ago a collision occurred between a motor cyclist and a car at a junction of the Chislehurst-Bromley Road where several similar accidents have occurred. The matter came up for discussion at the last meeting of the local council, and it was resolved to acquire if possible a strip of land and widen the corner, thus lessening the risk.

**New Fifty Miles, One Hour, Two Hours
and Hundred Miles Records.**

On Tuesday, W. Stanhope Spencer, riding a 3½ h.p. Rudge, captured several world's records at Brooklands. He started at 11.39 a.m., followed at minute intervals by W. H. Elce and W. L. T. Rhys. Spencer soon settled down to a steady average of about 66½ m.p.h. At thirteen laps he was 1m. 12s. inside record. At eighteen laps he was holder of the fifty miles record, time 45m. 34½s. In the hour he covered 65 miles 803 yards, previous best J. R. Haswell (Triumph), 63 miles 194 yards. He subsequently captured the 100 miles record, time 1h. 34m. 8s.; previous best J. R. Haswell (Triumph), time 1h. 37m. 52½s., and after stopping to fill up with petrol and oil, Spencer continued for two hours, which record he easily got, covering 122 miles 210 yards in that time; previous best Lee Evans (Indian), 108 miles 1.367 yards.

Banned by the A.C.U.

Fifty-five entries had been received for the Liverpool A.C.C. reliability trial on Tuesday, the list including the names of several leading Coventry trade representatives. The list finally closes this evening.

The 3,000 Miles Engine Test.

2,517 was D. R. O'Donovan's total mileage on Monday evening in his attempt to cover 3,000 miles without touching the engine of his 3½ h.p. Singer with a spanner. It is expected that the trial will conclude this (Thursday) evening.

Five Miles Record at the Crystal Palace.

On Saturday last, the Marlborough Athletic Club held a race meeting at the Crystal Palace track, in which there were two races set apart for 76×76 mm. motor cycles, one a five miles handicap, the other an attempt on C. R. Collier's five mile record set up on the same track. In spite of the strong wind and intense cold, Harry Martin rode his J.A.P. the five miles in 1½s. better time than Collier, his time for the five miles being 5m. 58½s. In the five miles handicap the first heat went to Martin with Dayrell on another Martin-Jap second. In the second heat Storey (S.A.E. Co.) beat Chase (Martin-Jap) who had a bad start. In the final Chase redeemed his defeat, Harry Martin retiring.

The first corner on Brasted Hill, on which the Streatham and District Hill-climb was held last Saturday.

*"Not a weak spot
in the machine!"*

So writes an experienced motor cyclist, and adds: "The Armstrong 3-Speed Gear is Wonderful."

New Hudson

The combination of the NEW HUDSON 3½ H.P. MOTOR CYCLE with the ARMSTRONG 3-SPEED GEAR AND CLUTCH gives a reserve of Power and Flexibility of Control not obtainable with single geared machines of any power.

Every New Hudson motor cycle is fitted with the Armstrong 3-speed gear, the strongest, most efficient, and most reliable gear and clutch applied to motor cycles.

"The variably geared machine is the only mount for the rider who wants to go everywhere without a lot of fiddling by the roadside."—*The Motor Cycle*.

THE ARMSTRONG 3-SPEED GEAR. THE GEAR THAT NEVER FAILS. ALL IN THE HUB. NO TROUBLE. ONLY WANTS OILING. Is perfectly reliable and without complications, its action is instantaneous and noiseless, its operation simplicity itself, the gears are changed while travelling without risk of damage—even by rough or careless treatment.

See "The Motor Cycle," Aug. 31st, on The Reliability of Variable Geared Machines.

EXTRACT FROM A LETTER SENT TO US BY A WELL-KNOWN CITY MERCHANT. AN OLD RIDER, OWNER OF VARIOUS MAKES OF MOTOR CYCLES—

"It may interest you to know that I have not had to touch the engine on my 900 miles trip. I have never been stopped on a single hill. THE ARMSTRONG GEAR IS MARVELLOUS. There is not a weak spot in the machine, and I would not exchange it for any other."

Mr. Wm. Ashton Mandale, of Workington, writes us—

"My 2½ h.p. New Hudson Motor Cycle came to hand last Tuesday. Two days later, on Thursday, September 7th, I gave it a trial run up to Keswick, 22 miles away, and I was simply astonished to find that the second and bottom gears were never required even though very stiff hills had to be climbed. The time taken was 36 minutes."

On the same day Mr. Mandale ascended Latrigg Hill, 2,203ft. high, on the approach to Skiddaw, never having ridden a New Hudson machine before. The road is a bridle path, very rough and steep, about 6ft. wide with four hairpin corners. These four corners are really more than "hairpin" because they come to a sharp angle of 45 degrees, and are mostly covered with short slippery grass. One wonders that the rider managed to keep his seat, yet he did, only once being out of the saddle.

"On the last ascent, a gradient of 1 in 3, I failed three times. The fourth time I came to a standstill again, but not before I had disengaged my clutch, thus keeping my engine running. The track that I was now on was barely 18 inches wide, and was really a V shaped gully caused by heavy rains. I had to jam my front brake on, also hold myself from slipping back with my left foot, then accelerate the engine to the full. When I engaged my clutch I did not think for one moment she would get away (on such a gradient as 1 in 3), but she did, and the top was reached."

"May I further say that through the whole of this severe test, I never heard the slightest approach of 'knocking' in the engine, and the little machine brought me home to Workington even better than on the outward journey. Also I am ready at any time to repeat the ride and hope next time to get up without once dismounting."

NEW-HUDSON CYCLE Co., Ltd., PARADE WORKS, **BIRMINGHAM**

In answering this advertisement it is desirable to mention "The Motor Cycle."

Motor Cycling COSTS money.

But probably the only time you begrudge the expense is, when the trouble comes.

The tyres, for instance. If it were not for all the bother with punctures and the constant dread of skidding—the expense would seem even better justified.

A tyre with the strength and excellence of the

TRIPLE STRIPE

Gaulois

(GOAL - WAH)

MOTOR CYCLE TYRE

Always makes your cycling a great deal easier and takes the worry away.

The satisfaction of knowing that the unusual strength of the Gaulois will keep away the punctures and its stripes will keep away the side-slips would be such a comfort to you on a long greasy run.

Ask your dealer to show you a section of the new Gaulois Triple Stripe Motor Cycle Tyre.

Next Week.

The Motor Cycle Overseas issue, containing special articles and illustrations of interest to motor cyclists all over the world.

Reduction in Tax.

Motor cycles registered between October 1st and the end of the year are chargeable at half the usual tax, viz., 10s. instead of £1.

A Relay Ride

A motor cyclist relay ride, from Adelaide to Sydney in which a number of riders mounted on mile-a-minute motor cycles took part, has created a great deal of interest in N.S.W.

A Novel Method of Route Marking.

In England we use arrows to indicate the route to competitors in reliability trials; etc. In Western Canada as there are no signposts or convenient points on which to fasten arrows or signs, the organisers of a 400 miles trial used large white beans to mark the course, the beans being distributed by the judges from a motor car.—Daily Paper.

English Amateur going to Canada.

A. Mackenzie-Cott, that enthusiastic rider of a big twin, is sailing for New York next week, and after a brief stay will proceed to Toronto, where he is taking up a post with the Russell Co., who have the Canadian manufacturing rights of the Silent Knight engine. Cott commenced his run of successes in hill-climbing contests whilst up at Cambridge. Early this year he sold his 8-10 h.p. Big Ben-Jap, bought a 7 h.p. twin Indian, sold that, and took delivery of a T.T. Triumph, but he could not resist the charms of a big reserve of power, and subsequently bought another 8 h.p. J.A.P. on which he made fastest time at the Coventry and Warwickshire M.C. hill-climb at Newnham early last month. He has our best wishes in his new venture.

Liverpool A.C.C. and the A.C.U.

With reference to the proposed open hill-climb which the Liverpool A.C.C. announced recently, interesting developments have ensued. It will be recalled that the A.C.U. would not "permit" the contest, but the Merseysiders were very anxious that for once in a way there should be a competition in Wales, and sought to evade the ban of the A.C.U. by means of the following clause in the club's rules: "Any motor cyclist may be admitted to this club as a member for any one month during the year on payment of the sum of 1s." This move has been countered by the A.C.U. by the passing of the following resolution: That any person taking part in this competition, who was not a *bona-fide* member of the Liverpool A.C.C. prior to September 1st, 1911, will be suspended or rendered ineligible to take part in any competition held under A.C.U. rules *sine die*. The onus of proving the date of election will rest upon the person affected. Evidently the A.C.U. does not consider that persons elected to membership for one special competition should rank as members of that club, and bring this forward as a reason for placing the competition under a ban.

The Quarterly Trials Route.

A steam roller is working on the Quarterly Trials route between Halesowen and Hagley Hill, and is likely to be there for some time. We are also advised that competitors would do well to ride with caution through Bromsgrove.

FUTURE EVENTS

Oct. 12.—"The Motor Cycle" Overseas Number.
 .. 13.—A.C.U. Council Meeting at the Imperial Hotel, Birmingham, at 7.30 p.m., to be followed by a Smoking Concert.
 .. 14.—A.C.U. Quarterly Trial (Midland Centre).
 .. 21.—Herts. County A.C. Autumn Open Speed Trials.
 Nov. 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

The Manufacturers' Union.

At the second annual meeting of the Manufacturers' and Traders' Union, which was held at the offices of the company in Coventry last week, Mr. Charles Marston announced his retirement from the presidential chair, and Mr. Arthur Brampton was elected president for the ensuing year. The opportunity was taken of presenting the retiring president with a suitable memento of the appreciation of the services rendered during the first two years of the existence of the Union.

Mr. Harry Smith (Rover Co.) was unanimously elected senior vice-president, and Mr. H. G. Burford (Humber Ltd.) junior vice-president.

The cash balance now standing to the credit of the Union amounts to £4,286. Mr. Alfred Bednell, the secretary of the Union, is to be congratulated on the satisfactory state of the balance sheet, and with a strong committee there is every prospect of continued prosperity.

A Stolen Mount.

Three weeks ago, Mr. Percy Butler had the misfortune to have a 3½ h.p. roadster Triumph stolen. The date on the crank case is April, 1910, and the machine has Hutchinson tyres fitted and a Cowey speedometer registering up to 80 m.p.h. Registered NI 41. Mr. Butler would be glad of advice as to its whereabouts at 3, St. Peter's Square, Manchester.

Hill-climb in the Antipodes.

The Larkie trophy was competed for in a hill-climb held by the Motor Cycle Club of N.S.W., on Baden Hill, Coogee. Competitors were handicapped according to previous performances and size of engine used. In the second round W. Miller (¾ L.M.C.) handicap 3s., time 28½s., defeated E. A. Rigg (¾ Triumph) 1s., time 27½s. D. S. Mair (¾ L.M.C.) 8s., defeated Searl (5 J.A.P.), belt broke. H. R. Ludgater (¾ L.M.C.) 10s., time 35s., defeated A. Fair (¾ Kerry-Abingdon) 5s., time 35½s.

Final.—1, H. R. Ludgater (¾ L.M.C.) 10s., time 35½s. 2, D. S. Mair (¾ L.M.C.) 8s., time 38½s. Mr. Ludgater, who is the secretary of the organising club, scored a very popular win. The Larkie trophy will be awarded to the rider scoring the best average in three hill-climbs.

Ladies and Carrier Seats.

The practice of carrying a passenger on the carrier appears on the increase amongst lady motor cyclists. A Brömley (Kent) lady owner of a Hobart Bird is frequently seen with her sister seated on the carrier of her machine, which is painted an attractive grey. Mrs. Hardee, of Greenwich, has made several long runs lately in Kent with a passenger, and at the week-end climbed Westerham Hill with a passenger scaling ten stones, on her two-speed P. and M. She considers it is more pleasurable than driving alone. Another lady was seen riding down Brasted Hill on Saturday after the Streatham hill-climb was over with a male rider on the carrier.

Scene at the foot of Brasted Hill. Competitors assembling for the start. Machines were parked in the field at the right.

HILL-CLIMB AT BRASTED.

C. S. Burney
(3½ h.p. Rudge)
at the corner in
the Streatham
and District
Hill-climb last
Saturday.

THE Streatham and District M.C.C. held a very successful hill-climb on Brasted Hill (situated on the North Downs between Hog Trough and Cudham Hills) on Saturday afternoon last. The programme contained seven classes.

I.—Lightweight touring motor cycles not exceeding 340 c.c.
II.—Single-cylinder touring motor cycles not exceeding 500 c.c.

III.—Multi-cylinder touring motor cycles not exceeding 1,000 c.c.

IV.—Variably geared touring motor cycles not exceeding 500 c.c. singles and 1,000 c.c. multi-cylinder, competitors to make a start seated in the saddle.

V.—Racing motor cycles not exceeding 500 c.c.

VI.—Racing motor cycles not exceeding 1,000 c.c.

VII.—Passenger machines carrying two persons.

The awards were made on time in the racing classes Nos. V. and VI. and on formula in the other classes. The

formula used was $\frac{W}{C \times t^2}$, which is substantially that recommended by *The Motor Cycle*, the cubic capacities being taken from *The Motor Cycle* table.

Brasted Hill is very suitable for the purpose. It begins with a moderate incline and fairly straight, becoming much

steeper near the top, the reputed gradient at the first bend being 1 in 5½. The surface having been swept was quite good. The bends are not sharp enough to be dangerous, but sufficiently acute to enable riders to show their skill and judgment, which some of them most certainly did. A good many riders on the fastest machines found it necessary to cut out more than once. The fastest ascent of the day was made by Godfrey on a 7 h.p. Indian, but Newsome (3½ h.p. Triumph) was only ½s. slower. The Devonshire riders, Broadbear and Holloway, gave a fine exhibition on their Premiers, and took the corners particularly well. Taylor, on the Scott, came up beautifully, but not so fast as many.

Considering the steepness of the hill the sidecar machine showed up well. It was, however, a bit too much for the single-cylinder. T. H. Tessier's "Baby Bat," which was second in the variably geared class, was reported to weigh 220 lbs! Godfrey and Newsome have already been mentioned. The other cracks, Newman, Woodhouse, McMimmies, and Burney put up some fine performances, but the hero of the afternoon was undoubtedly F. W. Barnes, who was first in no fewer than five classes, often by a considerable margin, and again won the D. R. Greig challenge cup for the best performance on a variably geared machine. The Tilley challenge cup awarded for the highest figure of merit made

Streatham and
District Open
Hill-climb.

R. Holloway
(3½ h.p. Premier)
on the first bend.

The Devonshire
riders took the
corner without
cutting out or
slackening speed,
whilst leaning
over at acute
angles.

Hill-climb at Brasted.—

Tossier, sen., on the Bat lightweight, with Phelon & Moore two-speed gear, near the bottom of the hill.

by a member of the club (not connected with the trade) goes to E. B. Ware. These and the other awards are subject to the confirmation of the committee. The afternoon's sport was marred by no accident of any kind. Ommamney, on his Rudge, being nearest to it when his machine skidded in the ditch just past the first bend, but he pulled up skilfully. Several competitors had pipes attached to the extra air of their B. and B.'s, which, by means of the inertia of the air would have the effect of forced induction. The Amac C.A.P. and Pugh carburettors were also in evidence. The entries constitute a record for an open hill-climb. There were a fair number of spectators, including Mr. Julian Orde, the president of the club. The results, which were very quickly worked out, were announced the same evening, and are:

CLASS I. Lightweights. (Twelve entries.)

Rider.	Machine and Gear.	Time.	Fig. of Merit.
1. F. W. Barnes	(2½ Zenith, Gradua)	X+14.2	583
2. J. Dudley	(2½ Hobart)	X+19.2	403
3. W. Heaton	(2½ A.J.S., A.J.S.)	X+22.8	353
4. F. Edmond	(2½ Premier)	X+25.8	339
5. H. G. Dixon	(2½ New Hudson, Armstrong)	X+24.6	334
6. T. H. Tossier	(2½ Bat-Jap, P. and M.)	X+36.8	307

CLASS II. Single-cylinders. (Thirty-two entries.)

1. F. W. Barnes	(2½ Zenith, Gradua)	X+15.2	556
2. F. Turvey	(3½ Triumph)	X+10.2	469
3. H. C. Newman	(3½ Ivy-Precision)	X+8	441
4. R. Holloway	(3½ Premier)	X+10	430
5. J. Woodhouse	(3½ Grandex)	X+10.8	427
6. R. Broadbear	(3½ Premier)	X+8.8	418

Fastest time X+7.8 was made by E. W. Cheshire (3½ h.p. Triumph), who was fifteenth on formula.

CLASS III. Multi-cylinder. (Seven entries.)

1. F. W. Barnes	(6 Zenith, Gradua)	X+9	359
2. S. T. Tossier	(4 Bat-Jap)	X+10.8	356
3. G. F. Hunter	(8 Zenith, Gradua)	X+9.6	257
4. A. J. S. Butler	(8 Zenith, Gradua)	X+14.4	210
5. E. B. Taylor	(4 Scott, Scott)	X+26.6	173

CLASS IV. Variably-gearcd machines. (Seventeen entries.)

1. F. W. Barnes	(2½ Zenith, Gradua)	X+21.8	424
2. T. H. Tossier	(2½ Bat-Jap, P.M.)	X+42.2	262
3. C. S. Burney	(3½ Rudge, Rudge)	X+26.2	255
4. P. Weatherill	(3½ Zenith, Gradua)	X+23.6	254
5. G. Griffith	(3½ Zenith, Gradua)	X+28	236
6. G. F. Hunter	(8 Zenith, Gradua)	X+12	228

CLASS V. Racing machines (not exceeding 500 c.c.). (Thirty-three entries.)

Rider.	Machine.	Time.
1. W. F. Newsome	(3½ Triumph)	X+6.4
2. W. G. McMinnies	(3½ Triumph)	X+6.6
3. H. C. Newman	(3½ Ivy-Precision)	X+8.2
4. R. Holloway	(3½ Premier)	X+8.6
5. J. Woodhouse	(3½ Grandex)	X+9
6. F. Turvey	(3½ Triumph)	X+9.8

CLASS VI. Racing machines (not exceeding 1,000 c.c.). (Twenty-seven entries.)

Rider.	Machine.	Time.
1. O. C. Godfrey	(7 Indian)	X+4.6
2. W. F. Newsome	(5½ Triumph)	X+5.4
3. W. G. McMinnies	(5½ Triumph)	X+6
4. A. Moorhouse	(7 Indian)	X+6.6
5. A. J. Luce	(5 Bat-Jap)	X+7.2
6. J. Woodhouse	(3½ Grandex)	X+7.4

CLASS VII. Passenger Machines. (Ten entries.)

Rider.	Machine and Gear.	Time.	Fig. of Merit.
1. F. W. Barnes	(6 Zenith and se., Gradua)	X+19.8	349
2. G. F. Hunter	(8 Zenith and se., Gradua)	X+18	283
3. W. O. Oldman	(6 Bat-Jap and se., P. and M.)	X+33	211
4. E. B. Ware	(8 Chater-Lea and se., Chater-Lea)	X+40.8	167
5. R. G. Nye	(8 Chater-Lea and se., Chater-Lea)	X+51.6	120

THE M.C.C. SPEED JUDGING COMPETITION.

This event, the last of the season, was run off near Potter's Bar on Saturday afternoon last. The course was one of about 5½ miles, and had to be covered three times. The first circuit at 16 m.p.h., the second circuit at 19 m.p.h., and the last at any speed up to and including 20 m.p.h.; each competitor to declare his speed immediately upon finishing. Competitors were divided into two classes—one for those riding motor bicycles and the other for drivers of passenger machines. Results:

Class 1.—1. R. B. Clark (5 h.p. Indian), total error, 21s.; 2. L. A. Baddeley (4½ h.p. Yeledab), 58½s.; 3. H. B. Karslake (4 h.p. Dreadnought), 78½s.

Class 2.—1. B. Alan Hill (3½ h.p. Rudge and sidecar), 177s.; 2. W. Cooper (3½ h.p. Bradbury and sidecar), 192½s.; 3. C. Lowry (8 h.p. Rover), 269s.

Clarke's running was quite remarkable, and his errors for the three circuits were respectively 7½s., 5½s., and 7½s., showing very good judgment. Karslake's old Dreadnought was out on its last competition, and has now retired.

The best lap was ridden by C. C. Cooke (Triumph) with an error of 1s. The medals in Class 1 are being presented by Mr. D. J. Maitland, of Ceylon, an enthusiastic member of the club. Mr. F. T. Bidlake was the timekeeper.

F. P. Johnson (2½ h.p. Humber) starting from Derby Road, Nottingham, in the Nottingham and District M.C.C. 100 Miles Reliability Trial for the Dennis-Bayley shield. The riders on the right are R. A. Johnson (TT Triumph) and H. S. Dawson (3½ h.p. Bradbury).

1912 MODELS.

Further Advance Details of New Pattern Motor Cycles and Accessories.

The 2½ h.p. S.I.A.M.T.

THIS interesting little machine, which has recently signally distinguished itself in Italy, the country of its origin, is being handled in England by Mr. Scales, 336, Gray's Inn Road, W.C. In describing any vehicle propelled by petrol vapour it is customary to begin with the engine. In the case

The overhead inlet valve mechanism of the S.I.A.M.T. The engine is inclined and has horizontal radiating fins.

of the S.I.A.M.T. we make no exception, and feel we can safely state that this is the most interesting part of the machine. The cylinder head is of quite an unconventional design, being screwed into the cylinder. It is guaranteed compression tight, carries both valves, which are of the overhead type, the sparking plug, and has radiating fins cast wherever there is space for them. The edge of this detachable head is castellated, and a special spanner is supplied for its removal. To be able to detach the head easily is naturally a great boon; not only

S.I.A.M.T. carburettor showing the bent trumpet-mouthed air inlet.

can the carbon deposit be easily removed from both head and piston, but the whole can be held in a vice while the valves are being ground in. The engine dimensions are 68x72 mm. The radiating fins are, since the engine is tilted slightly forward, cast parallel with the ground. The inlet valve rocker is mounted on an eccentric, and the engine is controlled by its means, as no throttle is fitted. The carburettor is of Italian design, and has an extremely long induction pipe, which it is claimed tends to

better vaporisation. One end of this long pipe is bolted to the cylinder, while the other passes beyond the carburettor and culminates in an open gauze covered end, behind which is a butterfly throttle controlling the air supply. To detach the carburettor it is only necessary to undo the holding on bolt of the petrol pipe and drop the carburettor away from its union

The power unit.

to the inlet pipe. The petrol enters at the top of the float chamber. The high tension magneto is the N.U., and is gear driven.

Triple Lever Handlebar Control.

All control is worked by a Bowden triple lever on the handlebar. An adjustable pedal bracket is provided. Two brakes are fitted, one applied to each side of the belt rim. The levers working these are so placed on the handlebar that both

The latest arrival in this country—the S.I.A.M.T.—a successful Italian lightweight.

Eccentric adjustment of the S.I.A.M.T. inlet valve rocker.

brakes can be brought into action by one grip of the hand. Points of convenience are well studied; these are a tapless oil pump, a good stand, and a sensibly designed pair of spring forks.

Considering that the machine is not specially designed for the English market, it conforms excellently to English ideas. In the recent Mont Cenis hill-climb in the class for machines up to 290 c.c., it won the Stampa Sportiva Cup, and gained the first seven places in the class. The winner's average speed up the fourteen mile climb was 34.6 m.p.h. It also gained a first and second in the Cono Brunate hill-climb. All these wins, we are informed, are records.

Double rear brakes on the S.I.A.M.T., which act upon the belt pulley.

THE B.S.A. MOTOR BICYCLE

The B.S.A. 3½ h.p. Motor Bicycle, Fixed Engine, £50; Free Engine, £56 10s.

There is not a Motor Bicycle on the road giving greater satisfaction than the B.S.A. The letters received from riders testify to its power, silence, and all round reliability. Several correspondents state that the B.S.A. 3½ h.p. has proved to be far more powerful than much higher-powered machines. Let us send you a copy of the Book of the B.S.A. Motor Bicycle, and the name and address of Agent where B.S.A. Motor Bicycles can be inspected.

A Tour through Wales on a B.S.A. 3½ h.p. with Sidecar attached.

Mr. B. D., of Edgbaston, writes:—

"I have just returned from a cycling trip in North Wales, and wish to congratulate you on the excellence of the B.S.A. Motor Cycle used. This machine (which has completed 2,000 miles) took a sidecar (passenger and self exceeding 22 stones in weight) from Birmingham through Bettws, Capel Curig, Beddgelert, etc., singly geared, without failing on a single hill, and has proved most satisfactory as regards its power, comfort, reliability, and general excellence.

"I have had single, twin, and four-cylinder machines of various makes, but none to equal your 1911 3½ h.p. Roadster Model.

B.D., Edgbaston,
29/8/11

In answering this advertisement it is desirable to mention "The Motor Cycle."

The 1912 model 3½ h.p. Humber, which has been re-designed throughout.

New pattern 2½ h.p. twin Humber in its touring form.

Humber.

The Humber Company have produced an entirely new 3½ h.p. model for 1912 embodying many improvements and refinements. Following the practice of the lightweights, which have met with such success this year, the new 3½ h.p. has a *désaxé* crankshaft. The bore and stroke are 84 x 90 mm. The side by side valves are operated by adjustable tappets, having fibre insertions in the heads. This should go far towards deadening the valve chatter, which is still a defect in many modern motor cycles. A half compression device is now fitted, consisting of a double exhaust cam and operated by the exhaust lift lever. This is so arranged

The separate cylindrical oil tank which is let into the petrol tank on the new Humber.

that a slight movement of the lever brings the half compression cam into action, while a greater movement raises the valve completely off its seating in the usual manner. Placed behind the engine and well protected from mud and dust is a Bosch magneto controlled from the left handle-bar. A large silencer with a simple roll over cut-out is fitted in front of the engine, and an exhaust pipe of ample dimensions is now fixed by an internal nut which adds to the neat appearance of the power unit.

Detail improvements consist of a dropped top frame tube, a front wheel stand, a rear mudguard hinged behind the carrier and an improved stand. The spring forks are on the well-known Druid lines, and have scimitar blade side

members. The petrol tank runs the full length of the top tube, and has a separate cylindrical oil tank let into it. This is a novel and praiseworthy device, as it makes for ease of construction and consequently absence of leaks. The front brake has a simple shoe adjustment, while the angle of the rear brake shoe, which is of the internal V-type, is also adjustable.

This model can be supplied either as a single gear mount (in which case pedals are fitted) or with an improved form of two-speed, in which several points are worthy of notice. The gear is still manufactured under Roc licence. This year there will be three planetary pinions instead of two. The high gear will be operated by an expanding cast iron liner, while the low has a contracting Raybestos lined band. The gear is fitted with ample thrust rings and bearings, and is so constructed as to be oiltight and mud-proof, while having a neat and light appearance.

The whole rear wheel may be easily removed by detaching the gear rods and

removing three nuts. The two-speed model is fitted with footboards, below which runs a counter-shaft carrying a simple acting cam which prevents the possibility of engaging both gears at once. Neither the 2 h.p. nor 2½ h.p. model has been altered to any great extent, but the company will list a very neat open frame model fitted with the standard 2 h.p. engine.

The method adopted on the new Humber models to adjust the belt pulley brake shoe.

B.S.A.

The first of the 1912 B.S.A. motor cycles was seen on the road recently. It has a dropped frame. We have had a short run on one of these machines, and found the 1912 design of clutch beautifully smooth in action.

The new model 3½ h.p. B.S.A. which, as will be seen, has a dropped top tube giving a very low riding position. This machine was ridden by Kenneth Holden in the last Birmingham M.C.C. competition.

1912 Models.—

Comet-Precision.

Mr. Haydon tells us that it is his intention to market two new models—a 2½ h.p. lightweight with a free engine, and a 4½ h.p. Colonial model with 5½ in. ground clearance.

Calthorpe.

There will be four Calthorpe models for 1912. A 4½ h.p. type for sidecar work, a 3½ h.p., a T.T., and a 2½ h.p. All of these models can be fitted either with a

Another new countershaft gear—the Calthorpe—on which a chain is employed from the engine-shaft and a belt from the countershaft.

new type of clutch on the expanding shoe principle, or with a new chain and belt counter-shaft two-speed gear, in which the gears are operated by taper friction clutches.

A 5 h.p. Twin A J.S.

A chat with Mr. Stevens elicited the information that next year he will market a new 5 h.p. on the lines of his well-known 2½ h.p. engine, for sidecar work. The 2½ h.p. machine will not be greatly changed. The engine will be modified, but the greatest change is in the fixing of the gear box.

Condor.

The Condor Engine Co. are building a 4½ h.p. single-cylinder engine of 86 × 112 mm., which comprises two unusual features—(1) the oil is fed through the cylinder wall into the hollow gudgeon

Offset valve gear of the 4½ h.p. Condor engine.

pin, and thence to the hollow big end and (2) offset cam gear, the valve tappets being set slightly to one side of the cam centre so as to do away with some of the side thrust.

Blumfield.

Mr. Blumfield tells us that as this year's engine has been so satisfactory there will be practically no changes in the design of his 1912 engines. He will, however, list several new sizes, making a most complete range. The types for 1912 will include a single-cylinder air-cooled

New Blumfield two-speed gear box. In this design the secondary shaft is fixed and the gears are cut on a drum and revolve on large diameter double row ball bearings. A plate clutch is fitted to the engine-shaft.

3½ h.p., 80×95; a single-cylinder water-cooled 3½ h.p., 80×95; a twin-cylinder air-cooled 4-5 h.p., 67×83; a twin-cylinder air-cooled 5-6 h.p., 67×95; a twin-cylinder air-cooled 7-8 h.p., 80×95; a twin-cylinder water-cooled 9 h.p., 80×95; and possibly a single air-cooled 2½ h.p., 67×83. This year Mr. Blumfield has decided to market for the trade two sets of frame fittings, one for a standard 3½ h.p. type, and another heavier set for sidecar work. This latter set includes a two-speed gear box set behind the saddle tube, and constructed for chain drive in conjunction with an engine-shaft clutch. We were shown a neat lightweight adjustable pulley on the lines of the large Blumfield pulley. It is worthy of note that all Blumfield engines undergo prolonged bench tests with fan brakes, and all the different models have side by side mechanically operated valves.

The Jonsca Two-speed Gear.

This gear, which was seen fitted to a 3½ h.p. Brough at the Brasted Hill-climb, consists of a double belt drive in combination with a selective clutch in the back hub. The pulleys are geared down at the engine-shaft to enable them to give a low gear and yet be of large diameter. The selective clutches, which are of the expanding type, are operated by pedals, and bring the required belt rim into connection with the back wheel, the other running loosely. One of the advantages of this gear is that practically any ratios can easily be obtained. Both gears are, of course, equally direct. Mr. John Scarborough, the inventor, also has a very simple starting device on the lines of a spring steel

The Latest M.M.

The latest type M.M. motor bicycle sold by Messrs. J. C. Lyell and Co., 113, Great Portland Street, W., is a 4 h.p., 82 by 91.5 mm. The engine has the exhaust valve in front and an automatic inlet valve. The ignition is by Bosch magneto, driven by a train of gear wheels. The gas is supplied to the engine by a Schebler carburetter, which is quite an interesting device.

The 7-9 h.p. V twin is similar in every respect to the above, except that it has two cylinders of the same dimensions as one single, and, of course, has a more strongly constructed frame.

The Excelsior.

The Excelsior Co. have two new 1912 models. The first is a 3½ single-cylinder of 85 bore and 88 mm. stroke, and the second a 4½ single-cylinder of 86×112 mm. Both these models will be fitted with the new Villiers two-speed gear to order.

The chief feature of the new engine is the lubrication, the oil being led into the hollow gudgeon and crank pins, and thence direct to the main bearings, which are of phosphor bronze throughout.

The 1912 B. & B. carburetter handle-bar levers, which are longer than this year's and slightly curved.

The valves are fitted with adjustable stems, and the engine, which carries the magneto behind it, forms with the carburetter and silencer an easily detachable unit.

One inch belts, dropped top tubes, and Druid forks with front wheel stands are

The Jonsca two-speed twin belt gear fitted to a 3½ h.p. Brough. It was observed at the Streatham and District M.C.C. Hill-climb.

standard on both models, and the company will manufacture sidecars, under Millford licence, and suitable for their own machines.

SIDECARS AND CHANGE-SPEED GEARS.

THAT many of your correspondents have asked for some private sidecar owners' experiences is my only excuse for writing of mine. It should be understood that I have absolutely no interest whatever in the makers of my machine, a free engine 1910 Triumph. I purchased it second-hand early this year, and have used it regularly ever since for my business, and for a fair amount of pleasure riding; in fact, from March to the present date I have covered 6,069 miles, nearly all of which have been with the sidecar, as even my business rides, with one or two exceptions, are accomplished with it. I have had repeated week-ends of two and three hundred miles in the Ilkley and Harrogate district. In the last ten days I have had 1,100 miles, with nothing worse than a burst butt-ended tube. On the 12th ult. I left Hull for London *via* Lincoln and Peterborough, and had a non-stop run. After a day spent in sight-seeing I returned solo, on the 14th, and had a non-stop run again. Three days later I had a short spin to see if I could detect any faults before starting for London again. There were none, and I returned highly satisfied.

Starting at daylight the next day, I crossed the ferry, and was soon flying along through the cold morning air to St. Albans, which I reached at 5.30 p.m. From here my troubles commenced, as, through mistaking my route, I was cruising about till 10 p.m. I eventually found myself on Mitcham Common, with the petrol given out, but I managed to run two short stretches by tilting the machine so that the petrol ran to the carburettor till every available drop was gone. Then I commenced the heart-breaking task of pushing in search of the "spirit that moves," but all to no

purpose. I was by this time feeling the want of food, as I had made only one stop for this purpose since leaving Hull (Leicester). After numerous wanderings I found myself at Thornton Heath, and here I was able to find a cycle dealer who could supply my need, but by this I was not in a fit state to ride, so I left the machine in his care and set out to walk to South Norwood, and here I might state that I found walking, unfettered by the machine, a very pleasant change. My mileage for the day was 257, about four of which I had pushed. The machine was fully loaded, and I was encased in leather-lined tweed with overalls, so your readers will understand my feelings. After a good supper and sponge down I slept the sleep of the just, next morning, after the cold tub, feeling fit for anything. I went over for my mount and had a spin to Epsom, returning at midday to South Norwood. The next day I was off for home with the sidecar attached, and my wife as passenger, with a considerable amount of luggage. We had a fine run home, and caught the last ferry boat at 10.30 p.m., reaching home at 11, having left Norwood at 10.15 a.m. The next day I made an ordinary visit to Eridlington, and we had as yet not unfasted the tool roll. The total mileage for ten days was 1,100, and the machine is still running, intact as far as the engine is concerned.

I consider these fine achievements for a single-cylinder $3\frac{1}{2}$ h.p. machine in the hands of an entirely amateur driver. In the whole of the 6,000 odd miles I have not been held up with engine troubles, and only had one long stop of note through the contact breaker of the magneto working loose and tearing the keyway.

H.W.J.

CLUB NEWS.

Sutton Coldfield A.C.

The petrol consumption trial took place last Saturday, over a course of 31 miles, half of which was ridden against a very strong head wind. Ten started, and the winner, who used a Howard dual sparking plug, was the heaviest rider, and covered the course on the least petrol. The results on formula are as follows:

1, James St. John ($3\frac{1}{2}$ Triumph), 6448, 162 m.p.g.; 2, H. Mills ($3\frac{1}{2}$ James), 5015, 122 m.p.g.; 3, J. Norton ($3\frac{1}{2}$ Norton), 4771, 142 m.p.g.

Sheffield and Hallamshire M.C.C.

Last Saturday afternoon the members held a very interesting reliability trial for sidecar machines over a course of 110 miles of fairly hilly country. Owing to the cold many of the sidecars contained gentlemen, though the ladies were well represented by Mrs. Bradbury Mrs. Stacey, Mrs. Short, Mrs. Stevenson, and Miss Greaves. J. Haslam, 6 h.p. Zenith and sc.; S. Donovan, 6 h.p. Zenith and sc.; H. Short, 6 h.p. Chater-Lea and sc.; — Stacey, $3\frac{1}{2}$ h.p. Rudge and sc. The competition fully demonstrated the reliability of the sidecar as a safe passenger carrying device.

Stockport and District M.C.

On the 23rd ult. the third hill-climb was held at Woodhead, the result being based upon time only, the fastest competitor in each class riding in the final, in which each competitor's time was equalised by handicap.

The class winners were: Lightweights—W. Heaton, $2\frac{1}{2}$ A.J.S.; singles—F. C. Cooks, $3\frac{1}{2}$ T.T. Triumph; sidecar—H. Greenhalgh, 5 Rex. F. C. Cooks made the fastest time, but in the final had to give the lightweight 40 secs. and the sidecar 52 secs., and was beaten easily by W. Heaton.

The next and last hill-climb of the year will be on October 15th at Woodhead.

Woolwich, Plumstead, and District M.C.

A speed-judging and reliability competition, open to members who had not won a prize this year, took place on the 1st inst., when eleven members started, and all covered the distance without a stop except one, whose belt came off. S. Lloyd (8 h.p. Matchless and sidecar) secured the first prize, only 34 sec. over time; H. Marsh (6 h.p. Riley tricar) was second, 45 sec. over time; and J. Richards (6 h.p. Matchless and sidecar) was third, one minute under time.

Some competitors at the start of the Sheffield and Hallamshire M.C.C. Reliability Trial for sidecars.

Club News.—

Manchester M.C.

The club's closing run was held on Saturday last to "The Ship" Hotel, Styal, Cheshire, in cold and unsettled weather. There was a good attendance of members and friends. After the club photo had been taken in front of the hotel, the party thoroughly enjoyed some impromptu gymkhana events in an adjoining field. After tea the prizes were distributed and an enjoyable smoking concert was held.

Coventry and Warwickshire M.C.

The closing run on Saturday will take the form of a speed-judging contest, and four prizes are offered. Entrance fee, 1s., will be collected at the starting point, Davenport Road. The start is at 2.30 p.m., and tea will be taken at the Bath Hotel, Leamington Spa.

The case in which Mr. G. H. Spicer was involved on the return journey from Aberystwyth in the August competition was dismissed at the Machynlleth Court on Wednesday of last week.

Birmingham M.C.C.

The third annual flexibility climb took place on Saturday, the 23rd ult., at Red Hill, near Alcester, the winner turning up in J. H. Percox on a $3\frac{1}{2}$ h.p. Alldays, the difference between the time of his fast climb and his slow climb being 2m. 7s. R. W. Duke, on a $3\frac{1}{2}$ h.p. Zenith-Gradua (gear fixed in one position), was second with a difference of 1m. 52s., Seymour Smith, on a $3\frac{1}{2}$ h.p. Norton, being third with a difference of 1m. 50s. The autumn reliability trials, held annually on the knock-out principle, have been postponed till November 4th, as there are several events in October which would interfere with the trials.

Leicester and District M.C.C.

Results of hill-climb held on 28th September at Kettleby Hill, near Melton Mowbray:

Tourist Class.—1, S. F. Fisher ($3\frac{1}{2}$ Triumph); 2, H. Petty ($3\frac{1}{2}$ Rex); 3, A. L. Barker (4 Clyde-Jap).

Tourist Trophy Class.—1, J. Dignan ($3\frac{1}{2}$ Triumph); 2, S. F. Fisher ($3\frac{1}{2}$ Triumph); 3, D. M. Patterson ($3\frac{1}{2}$ Triumph).

Open Class.—1, J. Dignan ($3\frac{1}{2}$ Triumph); 2, W. Canham (6 Matchless twin); 3, G. W. Hillyard (6 Zenith-Gradua twin).

Sidecar Class.—1, W. Canham (6 Matchless twin); 2, G. W. Hillyard (6 Zenith-Gradua); 3, E. Folwell ($3\frac{1}{2}$ Bradbury).

Lightweights.—1, J. W. Chapman ($2\frac{1}{2}$ A.J.S.); 2, G. W. Main (2 Humber).

J. Dignan ($3\frac{1}{2}$ Triumph) made fastest time of the day, viz., 50.3 m.p.h.

Forthcoming Event.—Edwards Cup: Third round (reliability trial), October 14th, 2.30 p.m.

Surrey M.C.C.

The annual hill-climb, which was postponed from September 13th, will be held next Saturday, October 7th. The rules will remain as already published, and all awards, including the Zenith Motors Ltd. gold medal for best performance of the day, will be made on A.C.U. formula. The hill will be within ten miles of Guildford; competitors must meet at headquarters not later than 2.30 p.m.

Bristol B. and M.C.

A competition is being held on Saturday, October 7th, with the Bath club, for teams of six solo and one passenger machine. The start, finish, and dinner (for which the losers will pay) will be at the Lamb and Lark Hotel, Keynsham, and a special entertainment is to be arranged. Anybody wishing to be present should write to P. Grout, of Warmley, near Bristol.

North Middlesex M.C.C.

The proposed run to Westcliffe for the 24th ult. unfortunately had to be cancelled on account of the weather.

The chief event of the year, the members' reliability trial for the handsome silver challenge cup presented by the Premier Cycle Co., takes place on October 8th. The route from the Gatehouse, Highgate, proceeds through Brockley, Aylesbury, Banbury, Edge Hill, Stratford-on-Avon, up Sunrising, Wellesbourne, Banbury, Bedford, and Hatfield, about 190 miles in all. Luncheon at Stratford-on-Avon. Prospective members are eligible for this competition and accepted at one year's subscription up to February, 1913. Hon. sec., D. G. Blakey, Heathfield, Great North Road, Highgate.

Purley and District M.C.C.

On Saturday last, a speed-judging contest was held over an unknown distance, the prize being a pair of Kempshall tyres, presented by the manufacturers. A car left Purley Corner at three o'clock, laying a confetti trail, and competitors had to follow by this trail at a set speed, drawn by each one separately on a ticket. The trail proved difficult to follow, no fewer than nine out of twelve starters failing to pick it up from the commencement. The three who finally tracked the car to its destination, which proved to be Pol Hill, near Sevenoaks, were: 1, W. G. Fowler (7 h.p. Indian), error 4.12 m.p.h.; 2, O. K. Meredith ($3\frac{1}{2}$ h.p. Bradbury), error 6.32 m.p.h.; 3, S. J. Taylor ($2\frac{3}{4}$ h.p. Douglas), error 8 m.p.h. The last-named, in addition to losing the trail at one point, was twice stopped by belt breakages. The distance was twenty-six miles. The thanks of the club are due to the donors of the prize, and also to Mr. Jago, who kindly acted as trail-layer. In view of the large number who failed to finish, it has been suggested that the contest should be repeated, but this has not been definitely decided on.

Competitors and spectators watching the start of the lightweights in the closing event of the Manchester M.C.

When the ZENITH-GRADUA ... is NOT BARRED. ...

A. S. L.

MOTOR CYCLE

Although the "A.S.L." Motor Cycle is the greatest advance in motor cycle construction ever known, it comes to you only after severe tests, and you are not asked to experiment.

It entirely does away with one of the greatest faults of the motor cycle—vibration.

Riding on an "A.S.L." machine is an entirely new sensation. No shocks of any kind are felt, both wheels being sprung. The rider is literally "riding on air."

Long journeys can be accomplished at high speed without fear of fatigue.

The air-spring, consisting of a piston working in an air-tight cylinder, simply designed and made, presents no complications. Its great advantage lies in the fact that it can be pumped up like an ordinary tyre to suit the rider's weight.

A.S.L., Ltd., CORPORATION ST.,
STAFFORD.

Telephone—156, Stafford. Tel Address—"Airsprings, Stafford."

"RIDING ON AIR."

C.D.C.

NOW—the 100 miles record has been beaten—Again it is our pleasure to announce another victorious achievement of our "LYSO" Rubber Belt.

—AT BROOKLANDS, Sept. 23rd, the 100 Miles Record Race was won by Mr. J. R. Haswell riding a $3\frac{1}{2}$ h.p. Triumph, fitted with a

"LYSO" Belt

and he covered the distance in 97min. 52secs.—and in the hour nearly 63 miles. In addition "LYSO" Belts were used on the Ridges, Bat-Jap machines; 2nd, 4th, 5th, 6th places, and many others in this Race.

—A splendid record like

100 miles in 1 hr. 37 m. 52 $\frac{2}{5}$ s.

wants some making—and some equalling—and one of the most satisfactory conclusions of the Race is the proved "RELIABILITY" of the Belt that stands such a strain!

—It's the "LYSO"—that's saying everything—and the knowledge of that fact will convince you of the importance of its presence on *your* machine.

—Always buy "LYSO'S" in future—you can't do wrong.

LYCETT'S, "The Saddlery," B'ham.

R.H.S.

Club News.—

Torbay and District M.C.C.

A speed trial will be held on October 14th at 2 p.m. A.C.U. speed formula will be used. Engines of any size may enter, and weight will not be taken into account. A special prize will be presented by Mr. R. Holloway for fastest time on a single cylinder. A members' hill climb will take place on October 21st at 2 p.m., when a special prize will be given for the best performance by a member who has not won a prize during the year.

Edinburgh and District M.C.C.

This club held a competition on the 23rd ult. to decide the winner for the year of the Sharp Trophy. The competition took the form of a fast and slow speed contest on Dolphinton Moor, and a hill-climb on Manor Hill, Peebles. There was a fair entry, but the slow speed contest seemed to be a great stumbling block, as three competitors only were left to compete on Manor Hill, namely, J. R. Alexander, A. H. Alexander, and Sandeman, riding 7 h.p. Indians. After the competition it was found that A. H. Alexander was the winner of the trophy, his brother having held it for the previous year. The weather was dull, and during the competition several showers of rain fell.

Blackburn M.C.C.

This club held its first competition—a hill-climb at Rivington Pike, near Bolton—on the 16th ult., the weather conditions being ideal. Each competitor was allowed two runs up the hill, the fastest to count. The following are the results:

LIGHTWEIGHT CLASS.

1. W. Snape (2½ h.p. Enfield) ...	61½s.
2. — Beech (2½ h.p. Torpedo) ...	68½s.
3. — Robinson (2½ h.p. Enfield) ...	72½s.

500 c.c. CLASS.

1. J. Thorne (3½ h.p. T.T. Triumph) ...	43½s.
2. H. Walsh (3½ h.p. Rover) ...	44s.
3. H. Fletcher (3½ h.p. Rudge) ...	50s.

UNLIMITED CLASS.

1. J. Allsupp (6 h.p. Matchless) ...	43½s.
2. J. Thorne (3½ h.p. T.T. Triumph) ...	43½s.
3. H. Walsh (3½ h.p. Rover) ...	45s.

Mr. W. W. Wilkinson presented a gold medal for fastest time of the day, and other valuable prizes were given by Blackburn tradesmen.

It is decided to hold a speed-judging competition on the 21st inst., when three valuable prizes will be awarded.

Westmorland M.C.C.

An informal run to York will be held on October 7th and 8th, starting from the Commercial Hotel at 2 p.m. on the 7th, and staying at York till the Sunday afternoon.

Woolwich, Plumstead, and District M.C.

Another very successful hill-climb took place on the 24th ult. at Star Hill. There were fifteen competitors. As before, it was carried out on the "knock out" principle, which provides excellent sport. The first prize, a gold medal presented by Mr. H. A. Collier, was won by H. Hill (3½ h.p. Rudge); second prize, value of entrance fees, by A. Wilson (3½ h.p. Triumph); and a special prize for the first novice, an inner tube presented by Mr. F. J. Ellis, went to H. Cork (Matchless).

Furness M.C.C.

The first reliability trial arranged by this club was held on the 17th ult. Considering the club was only started about three months ago, the trial was very successful. The competitors, thirteen in number, started from Barrow, and checked in turn at Newby Bridge, Kendal, Coniston, Greenodd (secret check), and again at the starting point, thus completing an eighty-mile course. The results were as follows: 1, Dr. F. E. Daniels (2½ h.p. Douglas); 2, W. Bradbury (2½ h.p. Douglas); 3, J. Brazington (3½ h.p. N.S.U.). The prizes were presented by Messrs. J. Lucas, Ltd., and Douglas Bros.

Lincolnshire A.C. (Motor Cycle Section).

The petrol consumption test held by the above club on Saturday, the 23rd ult., proved to be another very successful competition, although the entry was not quite so large as might have been wished.

After weighing in, dealing out the petrol, and sealing the tanks, a start was made from South Park, Lincoln, at about 3.30, where the competitors had to return after covering a thirty-five mile course, and have the remaining petrol drawn from their tanks and measured.

The following are the positions of the first five, subject to confirmation by the committee.

Fig. of Merit.

1. J. E. Harston (4 h.p. Champion-Jap) ...	433
2. L. G. Dawson (3½ h.p. Bradbury) ...	414
3. S. E. Walker (3½ h.p. New Hudson-Jap) ...	389
4. W. Cartwright (3½ h.p. Bradbury) ...	382
5. F. Richardson (3½ h.p. B.S.A.) ...	362

It is interesting to note that the winner's petrol consumption works out at 160 miles to the gallon.

A snapshot in Cheshire last week-end where a number of Manchester motor cyclists held a series of friendly races on a secluded stretch of road.

On the subject of

ADEQUATE TYRING FOR TRICARS.

Much dissatisfaction would be prevented if tricarists with high-powered machines would see that the Tyres fitted are likely to be able to stand the strains imposed.

7,015 MILES ON THE BACK WHEEL OF AN 8 H.P. "BAT."

(Extract from letter 5861 in "The Motor Cycle," Sept. 7th, 1911.)

"I bought a 650 by 65 mm. grooved Dunlop last summer. I put the tyre on the back wheel of my 8 h.p. Bat, driven solo throughout, and it stayed there for 4,280 miles, the first puncture occurring just before 3,000 miles. I had the tyre retreaded and relined by the Dunlop Co., and put it on the back wheel of my new 8 h.p. Bat at Easter. It is now worn down to the canvas, but has completed 2,735 miles all on the back wheel, of which 1,655 miles have been with sidecar. The tyre has thus a mileage of 7,015 on the back wheel of an 8 h.p. twin to its credit.

I have driven fast over Lancashire and Yorkshire roads, the Devonshire Hills and Lake District passes. . . . The wonderful wear of tyres on my machine enables me to run it at less cost than a 3½ h.p."

G. ARTHUR GREYSON.

DUNLOP

TRADE MARK

To us Mr. Greyson wrote concerning this tyre :—

"I have never before sent a testimonial to any firm; I feel sure that it is deserved in this case. . . .

I ride on rough by-roads and travel fairly fast, so I think the results obtained are more than satisfactory. . . .

It does not slow the machine so far as I am aware, and this statement is borne out by the fact that I made the fastest time of the day in both the Kirkstone Pass and Shap Fell hill climbs at Easter, averaging 59 m.p.h. up Shap from a standing start, and 50 up Kirkstone. Altogether I am thoroughly satisfied, and when I want a new tyre I shall not consider anything else but a Dunlop similar to the one I have at present."

THE FLEXIBILITY AND ACCELERATION OF THE MODERN CARBURETTER.

The greatest difficulty in producing a satisfactory carburetter has always been to make the carburetter flexible and to obtain good acceleration. In other words, (1) to be able to obtain the maximum power needed on a powerful racing machine and still get (2) slow running, and further, (3) to be able to get the

for racing are more or less freaks, and no good for ordinary work. It is, therefore, with pleasure that we have noticed exceptions. For instance, C. R. Collier used an absolutely standard pattern Amac carburetter when he obtained the speed of 91.37 miles per hour, and with the same sized jet he is able to run quite slowly.

Three special features are claimed by the makers of the Amac to account for this, namely:

1. Multiple spraying nozzle.
2. Variable adapter.
3. Straight through draught.

1. Multiple Sprayer.

The advantages of this are quite obvious. It is of course better to divide up the petrol supply into several streams as evenly as possible amongst the air supply, as by doing this a much more homogeneous mixture is produced than if the petrol were supplied in one single stream. This has, of course, been done previously in different ways, as, for instance, in the old Longuemare carburetters, but the Amac design is an improvement, as too small orifices are likely to get choked and are difficult to regulate. The petrol supply is regulated through one single hole at the bottom of the mixing chamber and is then split up through the sprayer.

2. Variable Adapter.

This is another feature which helps considerably in giving a good mixture. It is important that the air as it is passing the sprayer or nozzle should have a certain velocity, and that all the air should pass by the sprayer or nozzle to

give good results. With an ordinary air valve it is not possible to keep the speed of the air high when the engine is running slowly, the result being that the best mixture is not obtained, and liquid petrol is taken into the engine, and also remains clinging to the passages and preventing quick acceleration.

3. Straight Through Draught.

By this arrangement, all the air passes just above the sprayer, thus making for good mixture and efficiency. All turns and bends in the air passages are bad practice.

The Aston Motor Accessories Co. have only altered the design of their carburetters in detail.

Showing single nozzle below and five-spray holes above on the latest Amac.

correct mixture anywhere between these two points immediately and without difficulty.

It is the general opinion of the average motor cyclist that all carburetters used

The 1912 pattern Amac.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By ROAD RIDER.

CARRYING BULKY SPARES.

377. One way to carry a spare cover is to turn it inside out, roll it round the rear end of the petrol tank, and buckle a broad strap round it. It is then quite out of the way, and serves instead of knee grips. Rubber belts may be similarly attached, their ends being wired to the frame tube. Leather belts should not be carried, as they ooze grease on one's breeches. They are best looped round the handle-bar or strapped to the carrier. If they are carried outside on the machine and not folded up in a case the dust they collect gives them a better grip. Butt-ended tubes are probably safest if wound tightly round the handle-bar, and those with button-over-the-valve joints may be very neatly packed in this fashion. A strip of felt tied over them provides ample protection.

FREEING A SEIZED ENGINE.

378. Seized engines are perhaps a little commoner than usual this year owing to the vagaries of concealed automatic pumps, but the average amateur makes a great mistake if he fancies that a seized engine is necessarily a workshop job. In engine seizures due to under-lubrication the lower bearing of the connecting rod (commonly called the big end) is almost always the part to suffer; it is the first to be starved of oil, and

generally seizes and becomes immovable before any other detail of the engine has suffered appreciably. The great point in a seizure is to commence the freeing process immediately, before the parts have time to cool and solidify together. In bad cases two metal surfaces may become almost welded together if they are allowed to cool after a seizure. Paraffin is the best releasing agent. Should an engine "stall" on the road, miles from a human habitation, try to keep the engine revolving by hand power, meantime injecting torrents of oil with the pump. The best way is to revolve the engine backwards, and if it is immovable with the back wheel on the road, let down the stand, and pull the belt backwards. By this treatment the engine may often be freed sufficiently for the machine to be driven to a place where paraffin can be obtained. If the engine cannot be freed without paraffin, endeavour to get the piston into the right position for removing the cylinder. *i.e.*, at the bottom of the stroke with the connecting rod at the back of the slot in the crank case top. Then remove the cylinder and procure paraffin. If the seizure is so bad that the piston cannot be moved, the first dose of paraffin must be applied above the piston, *via* the valve or plug orifices. The paraffin will take a long time to penetrate down into the crank case and reach the big

end, and the quantity which gets through will not be sufficient wholly to loosen the connecting rod. Be satisfied if you can move the rod enough to get the piston lowered so that the cylinder will come off. Force should only be applied very gingerly, as there is a risk of stripping the timing gear. As soon as the cylinder is off fill the crank case full of paraffin and leave it for ten minutes to soak between the seized surfaces. After this delay it should be easy to revolve the engine, and gradually the big end will work quite free. When it is absolutely free drain off the paraffin and pour in half a pint of oil. Then revolve the fly-wheels by hand until the fresh oil has formed a good film between all working surfaces. Reassemble the engine, and oil it very freely for fifty miles. It may not be necessary to send the engine to the factory afterwards, but as a rule, after such a seizure looseness amounting to three or four-thousandths of an inch will exist on the crank pin or the big end bush or both, and will make its presence felt by a "knock," especially when the engine is running light down hill, but the journey or tour may be safely completed before proper repairs are put in hand. The cause of the seizure should be identified before proceeding. It may be due to forgetfulness on the rider's part in respect of lubrication

An Adjustable Pulley.

By this invention the movable flange of an adjustable pulley may be operated by pneumatic or hydraulic means. The fixed pulley flange A is formed with a boss B, within which is arranged a rotary delivery chamber C. The chamber is supplied with air (or liquid) under pressure by means of a delivery pipe D, the face E of which is adapted to form a non-return valve to prevent the escape of the air. A collar F is fixed on the boss B, and between this and the movable pulley flange G is arranged an expansible chamber H, which is provided with a valve J, by which the air admitted to the chamber C may pass to the chamber H. It will be seen that, as the pressure in the chamber C rises, it forces out the valve J and expands the chamber H, moving the pulley flange G inwards. When it is desired to lower the gear (by moving the pulley flange G outwards), the valves E and J are opened by slightly moving inwards the feed pipe D, allowing the air to escape and permitting the belt pressure to move the pulley flange outwards.—A. P. and C. W. Cairns, No. 12,201, 1910.

Combined Luggage Carrier and Mudguard.

This is the construction fitted to the Rudge-Whitworth motor cycles. The carrier A is of tubular formation, and is supported by stays B C. As it is to form part of the mudguard, it is covered with

sheet metal, which is extended forward and has riveted to it the segment of mudguard D. At the rear the sheet metal is bent over at E to form the number plate, at the lower end of which is riveted the rearmost segment of mudguard E.—J. V. Pugh and Rudge-Whitworth, Ltd., No. 17,975, 1910.

A Novel Sidecar Frame

This invention relates to a construction of tricycle having two front steering wheels and one rear driving wheel. It is intended for the support of a sidecar, and is stated to possess considerable

advantages over the ordinary type as at present generally used, in which the sidecar wheel is arranged in line with the driving wheel. In the patent under notice, the wheels A and B are in track, and may be those of an ordinary machine. The wheel C is supported by rods D E, the connections of which may be easily detachable. The wheel C is linked to, and steerable with, the wheel A, and in the case illustrated is of the type in which the steering pivot is contained within the hub. The wheel A may also be of this type if required. It is obvious to every constructor that the rake and lead of the pivot pin lying in the hub of the wheel C should correspond to the set of the steering head of the machine to which the attachment is fixed.—P. L. and J. Renouf, No. 10,381, 1910.

Quick Detachable Sidecar Joints.

The registered design No. of the joints made by Maude's Motor Mart, and illustrated on the 21st ult., is 577,163.

Tyre Successes.

Dan Bradbury, secretary of the Sheffield and Hallamshire M.C.C., writes to the makers of the tyres fitted to his Norton motor bicycle, and says that he has had splendid results with Clinchers this year, winning many club prizes, among others the Hutton shield for a 360 miles reliability trial.

Retreading Up-to-date.

A correspondent has sent us a cover which he found two motor cyclists repairing a few days ago. The riders were of the opinion that a thin strip of canvas attached to the tread would improve matters. Evidently their knowledge of the friction set up between the tyre and the road was very limited, as the narrow strip of thin canvas was soon reduced to rags. The cover has been sent us for inspection, and presents a very sorry spectacle.

Consistent Running.

An extraordinary instance of consistent running was disclosed at the hill-climb organised by Cowbridge motor cyclists, and referred to on page 1015 last week. Dr. Templeton, on a 2½ h.p. Royal Enfield, won the 2½ h.p. class. Mr. Homfray on a similar machine won the open handicap, two Royal Enfields being left in the final. The finishes were exceedingly close, there being two dead heats between the riders of these machines, and when being run off for the last time there was only the length of a wheel between first and second.

Maps of the British Isles.

We have received a set of three maps, viz., England, Scotland, and Ireland, which Messrs. Percy Butler and Co., 3, St. Peter's Square, Manchester, are issuing free to policy holders as an advertisement. The set of maps, which are of the folding kind suitable for pocket use, may be obtained for one shilling.

The Strength of Sidecar Axles.

The growing number of accidents due to breakages of sidecar axles has led Messrs. Mills and Fulford, one of the pioneer sidecar manufacturers, to demonstrate to us that the breakages are in no way associated with the well-known Millford sidecar attachments, but are confined to the so-called cheap sidecars. Mr. W. H. Fulford left with us a sample axle for our scrutiny, and we have had it photographed together with a foot rule to give some idea of its substantial proportions. A correspondent this week draws attention to a weakness of some sidecar axles in that the cone is screwed on to the axle. It may here be mentioned that in the case

of the Millford sidecars the axle is tapered and the cone wedged into position. One may have every confidence in riding in a Millford sidecar with the knowledge that an axle of ½ in. diameter is used.

Cylinder Repairs.

Weldings, Ltd., Lionel Street, Birmingham, undertake the repair of broken cylinders, and can even successfully repair a cylinder the flange of which has been completely broken away. The flange is welded on, and afterwards the welded portion is reground to suit the existing piston.

New Sheffield Garage.

Sheffield and touring motor cyclists who enter Sheffield from the Derbyshire side will be interested to know the long-felt want of a supply and repair garage has just been filled by the opening of the International Engineering and Motor Co.'s

The ½ in. diameter Millford sidecar axle.

new garage in Millhouses near the city boundary. Sheffield was one of the few places where the touring motorist had trouble in finding supply stations.

STRENGTH & SPEED.

"KINGSBURY,"

HARLESDEN ROAD,
WILLESDEN GREEN, N.W.
September 26th, 1911.

Messrs. The R.O.M. Tyre Co., Ltd.,
31, Brooke Street, W.C.

Gentlemen,—

You will be pleased to know that I have been awarded the special prize for best passenger performance in the recent Essex Motor Club London to York and back 24 hours' run. My Bradbury Sidecar Combination weighed over 600 lbs. with passenger and luggage, yet the Rom tyres (2½ in.), with which all three wheels were shod, were not touched during the 400 miles.

Yours truly,

(Signed) A. T. STANTON.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

WAUGHOP'S

LONDON'S ONLY
MOTOR EXCHANGE IN
THE HEART OF THE
CITY.

OFF FLEET STREET,
NEAR LUOGATE.

Phone: 6777 Holborn.
Wires: "Opifcer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 100, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o 'The Motor Cycle,' 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illife and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

PHELO and Moores, new 1911 models, nnerated, ready for immediate delivery.—Walkers, Fishburn, Ferryhill.

TRIUMPH, late 1910, excellent condition, just overhauled; £35, a bargain.—Cyril Walker, Wooler Rd., West Hartlepool.

DOUGLAS, 1911, done 1,500 miles, in splendid condition, complete with accessories; £30 lowest.—Hodgson's Garage, Main St., Keswick.

1911 Scott, in splendid order, not done 4,000 miles, complete with F.R.S. lamp, and Cowey speedometer; £50.—Dr. McIntyre, Braudon, Durham.

4 h.p. Rce, magneto, Chater-Lea frame, 26x2½ tyres, B. and B. carburettor, footboards. Very fast, perfect order; £27.—Box 8,264, The Motor Cycle Office, Coventry.

3 h.p. Fafnir, Chater-Lea, accumulator, torpedo tank, lamp, and spares good tyres, very powerful and fast; £21.—Box 8,265, The Motor Cycle Office, Coventry. Photos on application.

1911 Model 3½ h.p. Triumph, £48/15; 3½ h.p. Scott, £60; 3½ h.p. Ariel, £50; 2½ h.p. N.S.U., £40; now ready for immediate delivery.—Perry Motor Co., Ltd., Northumberland St., Newcastle-on-Tyne.

SECTION II.

York and Lancashire.

1908 Triumph, perfect condition; £25/10.—Carruthers, 21, Linden Grove, Leeds.

1911 3½ h.p. Lincoln Elk free engine; £28.—Taylor, 76, Newland Av., Hull.

1911 3½ h.p. Lincoln Elk, ridden very little; £30.—F. Hayes, 21, Waverley St., Oldham.

LATE 1910 Phelon and Moore, like new, all accessories; £44.—50, Beverley Rd., Hull.

1910 T.T. Triumph, good condition; £33.—Particulars, Adams, 42, Portland St., Southampton.

1911 Bradbury, condition new, very little ridden, tools; £38.—Hart, 359, Oxford Rd., Manchester.

1911 Royal Enfield, 2½ h.p., 2-speed, free engine.—Parkinson and Co., Rawtenstall, Lancashire.

1911 T.T. Triumph, condition as new; any trial; £41.—Nuttall, Hillfield, Farnworth, nr. Bolton.

WOLF, 1910, 2 h.p., Druids, Amec, splendid condition, less stand; £16.—83, Tynan St., Liverpool.

1908 Triumph, splendid condition, lamp, horn, backrest and spares; £30.—23, Arthur St., Rotherham.

1908 3½ h.p. N.S.U., magneto ignition, h.b.e. B. and B., excellent condition; £14.—65, Hidden St., Bolton.

1911 Triumph, clutch model, Palmer cord, lamp, horn, all spares perfect; £47.—45, Wigan Lane, Wigan.

£9 Per H.-P.

Brand New 4 h.p. N.S.U. Model de Luxe, single-cylinder, spring forks, magneto, H.B. control, stand, carrier, tools, No. plates. Ideal for sidecar work.

REMEMBER

The value of your present machine is depreciating
week by week.

Why not exchange now or at the end of the season
for a 1912 model?

We can allow far better prices than those which rule
in April, and, if you wish, advance you a big part
of the allowance in cash.

Why not write, or, better, call and discuss with us.

TIME SAVERS

Satisfactory repairing of punctures without the aid of vulcanizing is now rendered possible by the aid of

THE CHEMICO RELIANCE PATCH

Besides being a great saver of time it is also a big factor in expense saving.

ing, bringing the item of puncture repairing to a very appreciable minimum.

CHEMICO RELIANCE PATCHES are a combination of vulcanized and unvulcanized rubber, the face of which is pure para. The tenacity with which the patches cling to the tracture is wonderful. Heat will not affect same—or rather it has no detrimental effect—for the hotter the tyre becomes, the tighter the patch will hold.

VULCANIZING ENTIRELY SUPERSEDED.

Oval, Square, or Rectangular, from 1/- to 20/- per dozen.

THE "CHEMICO" RELIANCE STIFF-BACK PATCH

is an improved form of para faced patch and has entirely eliminated the annoyance of curling up. Each patch is mounted upon a cardboard backing which compels it to lie flat when solutioned, and is therefore easily applied to the tube. The backing is removed after patch is in position.

In Oval shape only, from 1/3 to 13/6 per dozen.

THE CHEMICO ROLLER OUTFIT

is absolutely noiseless, unbreakable, and everlasting. Its contents are inserted in separate pockets to ensure silence, and is kept closed when not in use by concealed springs. The most perfect motor cycle outfit yet produced.

Price 3/- each.

THE COUNTY CHEMICAL CO., LIMITED, Bradford Street, Birmingham.

LONDON: 43, Gt. Eastern St. MANCHESTER: 235, Deansgate. GLASGOW: 128, Renfield St. DUBLIN: 30-40, Golden Lane. CARDIFF: Womaby St.

LAUGHED AT!!!

We were actually laughed at, when (nearly 12 months ago) we commenced fitting **XTRA STRONG** axles to our sidecars.

OUR judgment, however, was correct. Other makers are slowly falling into line. **NUF SAID !!!**

All Farrar's Sidecars are now fitted with special **Quick DETACHABLE JOINTS**

as illustrated below.

This is our Model de Luxe. Complete £5 : 5 : 0 Complete

**FARRAR'S
HALIFAX
SIDECARS.**

Absolutely the finest value on the market.

LESS POWER.

It is admitted by experts that, owing to the unique design, far less power is required to propel Farrar's Sidecars than any other style on the market. NOTE OUR front arm which grips the Sidecar CENTRE. Nothing loosed about this attachment.

All our Sidecars are now fitted with cranked back axles, refinements found on very few other makes.

MODEL "DE LUXE" £5 5
MODEL "C" with cane body £6 0
MODEL "D" with coach-built body £7 0
MODEL "E" with reversible child's seat £5 10
ALL COMPLETE WITH MUGGUARD AND TYRES.

Discount to the Trade.
Delivery from stock to suit TRIUMPHS, REXES, P. & M's, N.S.U.'s, etc.

LIGHT, STRONG, AND SPLENDID VALUE.
SPRUNG LIKE A CAR.

Sole Agent for Australia and New Zealand:

HITCHEN'S MOTOR EXCHANGE CO., LTD.,

Euston Road, MORECAMBE.

Telephone 112. Wires Motor Morecambe

As continual dropping wears away the stone, so are we hoping; by telling the same story week by week, and year by year, to wear away the prejudice of the public against trading with us because we are dealers.

As a matter of fact, we can do far better for you than any private seller, and fifty times better than three-quarters of the people who advertise as private sellers, but who are nothing more than private Motor Brokers or small Push Cycle Dealers, writing from their own or somebody else's private address. Beware of these people.

The following are a few reasons why trading with a respectable firm of dealers is more advantageous to you than bothering with the small fry who are continually posing, through the medium of the paper, with having something to sell wonderfully cheap.

By dealing with us, you are dealing with a firm who have a reputation to uphold, and who prefer, at all times, not to do business with you if it cannot be done in a straightforward manner. Also, in trading with us, you are dealing with the only firm in the world who advertise week by week, and year by year, to send you anything you want on approval against cash; and if the thing does not suit you allow you to return it within three days and have your money back in full. Please note! We don't send goods without the cash, as our staff of book-keepers is limited; therefore don't be insulted when we refuse. By-the-by, we will open a credit a/c with you with pleasure on receipt of references.

Another thing: We advertise in our own name. We don't write on plain note paper, and make you believe we are a private seller, and tell you we are going abroad, selling under doctor's orders, or tell you a pretty fairy tale about being in financial difficulties, while, at the same time, we are in the trade. We may refuse to take exchanges in the way of bull pups, poultry, prize canaries, and many other things which we are offered; but if you offer us a motor cycle, we will always try and accept same in exchange for another one; or, if you want to dispose of your motor cycle for cash, we will sell it for you on a five per cent. commission, and make you a cash advance at once.

Don't forget us for next year's model. We have contracted for a larger supply than ever before, and we have close on 500 coming through from the makers. These we shall be pleased to dispose of on Cash, Deferred, or Exchange terms, and await your kind orders. Specification list awaits postcard. So long, b'boys, while Thursday.

G. RAWES & SONS' MOTOR CYCLE CLOTHING SALE!

Looks neat and feels comfortable.

The end of the season is approaching, and we are determined to clear our surplus stock at a reasonable reduction of 10%.

ALBANY "STANDARD" SUIT.

In grey-green or fawn double-texture cloth. Guaranteed absolutely waterproof. We sell garments separately.

JACKETS ONLY.—Double-breasted, deep storm collar, and special adjustable strap to keep out rain and dust. Inside and outside wind cuffs, etc., etc. 18/-, less 10%, 16/3.

LEGGINGS ONLY.—Leather adjustable boot strap, V-shaped gussets, and patent dome fasteners to exclude wind, rain, and dust. Specially shaped to protect eyelet holes. 8/-, less 10%, 7/3.

Complete Suit, 25/-, less 10%, 22/6.

Albany "Special" Leggings.

In grey-green or fawn double-texture cloth to match "Standard" Jacket. Guaranteed absolutely waterproof. All latest improvements, and specially designed to come well up and protect the stomach from wind and rain. Without seat 13/11, less 10%, 12/6. With seat, including special convenience, 15/11, less 10%, 14/6. For Winter riding these "Specials" are indispensable. Buy now while prices are reduced.

Albany "All-Season" Jacket.

In grey-green double-texture cloth only. Double-breasted, deep storm collar, and inside and outside wind cuffs. Guaranteed absolutely waterproof. Fitted with best detachable fleecy lining. 25/- each.

Being motor cyclists ourselves, we found it very cold riding in Autumn and Winter, so this jacket was designed specially for all seasons. By simply detaching the lining, the coat can be worn in Summer. It is a great boon, and so great is the demand, and value so good that No Reduction is possible.

Very warm and comfortable.

Albany "Guinea" Suits.

In double-texture waterproof cloth, 21/-, less 10%, 19/-.

Advice to Purchasers.—These goods are our genuine stock, and every garment is guaranteed absolutely waterproof. Should you not be satisfied, we will refund amount paid if goods returned undamaged in 3 days.

Terms.—Nett Cash with order. Send chest measurement and length desired for Jackets, and inside leg measurement only for Leggings.

Send for Catalogue and patterns to—

G. RAWES & SONS,
Waterproof Clothing Specialists,
The Albany, Oldhall Street, LIVERPOOL.

PALMER.—40h.p. Mercedes, double limousine, Mercedes h.t. plugs, gate, very handsome; £275.

PALMER.—25h.p. Gladiator, side entrance, dual, steel frame, hood, very roomy; cheap. £125.

PALMER.—7h.p. Pope-Tribune, 2-seater, live axle, hood, requires tyres; to clear, £25.

PALMER.—14-16h.p. Ballot lorry, carry 18 cwt., magneto; £75.

PALMER.—30h.p. Darracq limousine, seats 6 inside, lovely body; bargain. £115

PALMER.—15h.p. Ariel semi-limousine, 4-cyl., 7-seater, modern; £55.

PALMER.—16-24h.p. De Dietrich, double landaulet, 4-cyl., very reliable; £100.

PALMER.—10-12h.p. Speedwell, 2-seater, 2-cyl., with box van at rear, suit traveller; £65.

PALMER.—16-24h.p. F.I.A.T., side entrance, 4-cyl., magneto, gate, perfect; £125.

PALMER.—20-30h.p. Beeston Humber, 1907-8, long chassis, h.t. magneto; £125.

PALMER.—All above and many others, with huge stock of new and second-hand accessories, special low prices, seen at

PALMER.—L. N. Palmer's Garage, 9a, Trevelyan Rd., Merton Tram Terminus, Tooting. 'Phone 208 Streatham. 8 minutes Balham L.B.S.C. Rly. Easy terms; exchanges.

6h.p. Genuine Dion Regal, magneto and coil ignitions, reliable and good condition, 2 new spare covers, tyres good; £45.—Hubbard Bros., engineers, Basingstoke.

12-14h.p. 2-cyl. Darracq, 2 or 4-seater, £29; also 5 h.p. Swift car, Fafnir engine, 2-speed and reverse, £18; will exchange motor cycle.—Smallwood, Bilston.

NEW Orleans, 8-10h.p., 2-cyl., 2 or 4-seater, live axle 3 speeds and reverse, splendid order; level exchange for good magneto motor cycle.—96, Crown St., Ipswich.

GOOD Little 10-12h.p. Speedwell car, hood, screen, detachable tonneau, condition guaranteed perfect; must sell; take £30 for quick sale.—Williams, 12, Belmont Rd., Clapham.

8-10h.p. Mass, smart 2-seater, 2 cyls. 84x100, all new grooved Dunlops, Lucas lamps, new Stepmey, spares, suit doctor; £65, good motor cycle part payment.—65, Hilden St., Bolton.

15h.p. Humber, cream, tonneau, perfect running order, hood, screen, Stepmey, 5 lamps, accessories; £100 or sidecar combination part payment.—7, Circus Rd. St. John's Wood, London.

OREL, 10h.p., 1909, 2-cyl., 2-seater, torpedo racer, hood, screen, overhauled, re-painted, new tyres, 4 lamps; £80, or offer; particulars and photo.—C/O Mr. Ancliffe, Mathersey Hill, Bawtry.

6h.p. Starling, 2-seater, high side doors, perfect order, hood, screen, Stepmey, lamps, and tools; must be sold, a genuine bargain, or would take 3h.p. Triumph in exchange.—172, Upper Richmond Rd., Mortlake.

FOR ANYTHING & EVERYTHING RELIABLE.

The Best Bargains in Motor Cycles and their Equipment, you'll find

TAYLOR'S

GIVE UNEQUALLED SATISFACTION.

A choice stock of New Machines of famous makes always on hand. A constant succession of genuine Second-hand Bicycles always on offer. Every machine thoroughly reliable.

SOLE AGENTS, RETAIL AND TRADE, LONDON AND DISTRICT, FOR THE A.J.S. LIGHTWEIGHT.

A Special List of Bargains in Second-hand Machines free for asking.

Let us send you List and full details of this little marvel of satisfaction and reliability. Call and see our stock of New and Second-hand Machines, including:

1911 3½ h.p. P. & M. 2-speed, just delivered **£56 10**
 1911 2½ h.p. DOUGLAS Model E 2-speed **£48 0**
 1911 5 h.p. REX DE LUXE 2-speed, new **£63 0**
 1911 3½ h.p. TRIUMPH, Clutch Model **£55 0**

NEW LAMPS FOR OLD

1000 FOOT BEAM
F.R.S.

The Perfection of Motor Cycle Lighting: 1,000ft. set, **£8/6**; 800ft. set, **£8/6**.

TAYLOR'S NEW SEARCHLIGHT. Genuine Mangia Leas. All British. Lamp only, **21/-**; Generator, one-way, **15/-**; Large size two-way Generator, **17/6**.

Don't forget we accept old lamps of any make, and give a most liberal allowance in part payment of new.

TAYLOR'S HANDY EMERGENCY REPAIR LAMP. A box holding Mirror, 4ft. of Tubing, and Acetylene Burner for working off generator. Invaluable for road repairs at night. Price **2/-**; postage **2d**.

A BARGAIN IN BELTING. Special Offer to further popularise **TAYLOR'S CENTIPEDE BELTING.**

Made of finest Chrome Leather and Canvas. Best for bad weather. Very flexible. Every hole eyeleted.

Usual Price, 1/6, 1/9, 1/3, 1/2, 1/1, 1/2, 1/1, 1/2. Special Offer, 1/-, 1/2, 1/4, 1/6, 1/10

A trial will prove its superior efficiency. Our **SIMPLEX ALL-LEATHER BELT**

is unquestionably the most reliable belt ever offered at a moderate price. Special sample belts at, per ft., 1/8, 1/4, 1/2, 1/1, 1/2.

CARBURETTORS. Amac and Brown & Barlow stocked. Second-hand Carburettors from 6/-. Approval.

TRY TAYLOR'S FOR TYRES. Promptest and most satisfactory. 10/- allowed for old covers of certain makes.

TAYLOR'S SELF-CONTAINED SIDECAR LAMP. A customer writes: "The lamp is very satisfactory, and is excellent value."

Price 8/6, carriage paid. **REX SPARE PARTS.**

The House with the London Stock, Retail and Trade. Tell us your wants, we can supply.

ENGINES.

3½h.p. Avon, m.o.v., silencer, good condition, complete; £4.-97, Wells Rd., Bath.

6h.p. Twin Engine, new, with Amac carburettor; sacrifice £6.-8, Copeland Rd., Walthamstow.

3½h.p. White and Poppe Engine and silencer, perfect; £26/10.-17, Lancroft Rd., E. Dulwich.

£6/10.—3½h.p. Raleigh, Fafnir engine, powerful and speedy.—Cossart, Vale View, London Rd., Bath.

3½h.p. Wolf Engine, Amac carburettor, coil, and 2 accumulators; cheap, £4/10.—Borland, Preston pans.

REX Engine, 3½h.p., less flywheel and exhaust pipe, new cylinder; £2.—Payton, 11, Balacava Rd., King's Heath.

4½h.p. 4-cyl. F.N. engine, good condition, suit mono-car or boat; £6; exchange single-cyl. or gramophone and cash.—Lee, 24, Farleigh Rd., Stoke Newington.

ENGINES.—complete with carburettors.—2h.p. Quadrant, £2; 2½h.p. Brown, m.o.v., 50/-; 2½h.p. De Dion pattern, £2; 3½h.p. Rex, 50/-;—Smith, 205, King St., Hammersmith.

6h.p. Twin-cyl. Water-cooled Fafnir Engine, with pump, ball bearing Bosch magneto, and silencer; perfect condition; offers—No. 8,598, The Motor Cycle Office, Coventry.

6h.p. Twin Engine, complete with carburettor, splendid condition, £26/10; 5½h.p. twin Rex, for magneto, new, £28/10; 3h.p. Brown, £2; 2½h.p. Minerva, £2/10; 3½h.p. Rex, £2/10.—Murray, 37a, Charles St., Hatton Garden, Holborn.

IGNITION APPLIANCES.

TWO Accumulators, nearly new, and voltmeter.—Cadwell, 93, Upper Richmond Rd., Putney.

IRIDIUM Champion Contacts, warranted pure, fitted return post 1/6 each; screws for Bosch magnetos, 3/6 pair.—Williams, 16, Wellington St., Woolwich.

MAGNETOS. Coils, and Accumulators repaired; remagnetising, re-winding, re-platinising; repairs to trade; catalogue.—The High Tension Co., Brownlow Works, 1a, Guildford St., London 1409 Holborn.

JEBRON. registered 231,298, greatly superior to platinum, unequalled for blades, screws, rockers, coils, cures misfiring; 2/6 each rivet; Jebron screws fit Bosch magnetos, 5/6 pair; old screws Jebronised, 2/6 each.

JEBRON Contacts used by Messrs. Collier Bros., Colver, Martin, in making world's records; Jebron fitted return post.—Jebron, 38, Herbert Rd., Plumstead, Kent.

MAGNETO. Coil, and Accumulator Repairs.—Re-winding, remagnetising, etc.; dynamo and motor armatures rewound; all work guaranteed.—Torrance and Runbaken, Nelson Works, Back Nelson St., Oxford Rd., Manchester. Tel: 1368 Central.

TYRES.

BASTONE'S, London, for value in covers and tubes.

BASTONE'S.—New motor cycle covers, ribbed pattern; wired edge—26x2, 11/9; 26x2, 12/9; 26x2, 13/9; 28x2, 12/6; 28x2, 14/6; beaded edge—26x2, 13/6; 26x2, 14/6; 26x2, 16/6; 28x2, 14/6; 28x2, 16/6.

BASTONE'S.—Great bargains in rubber-studded heavy covers, wired edge; 26x2, 14/-; 26x2, 15/-; 26x2, 16/-; 28x2, 15/-; 28x2, 16/-; beaded, 1/- extra.

BASTONE'S.—New Michelin, Michelin covers, brand new and latest pattern; wired edge—26x2, 12/3; 26x2, 14/-; 26x2, 16/-; 28x2, 13/-; beaded edge—26x2, 14/8; 26x2, 17/-; 26x2, 21/-; 28x2, 16/9; steel-studded covers, wired edge—26x2, 54/6; beaded edge, 56/.

BASTONE'S.—Tubes with valves, best quality, and guaranteed; 26x2, 8/-; 26x2, 8/6; 26x2, 9/-; 28x2, 8/6.—Bastone's, 215 and 217, Pentonville Rd., King's Cross, London, N 'Phone: 2481 North. T.A.: Bastone's London.

TYRES Repaired by H.F. process; studded bands fitted.—Marshall, 117, Shacklwell Lane, Dalston, London.

KEMPSHALL Heavy Anti-skid Cover, 26in.x24in. unused; 32/6.—No. 8,592, The Motor Cycle Office Coventry.

TAYLOR'S.—Michelin, 1911, guaranteed new stock 26x2, m.o.v., 12/3, 24 14/-, 24 16/-; beaded, 14/8 17/-, and 21/-.

TAYLOR'S Offer 10/- for old covers towards new 2 Continental rubber non-skid and Peter Union two rib; Palmers, Clinchers, Knapshill, and Hutchinson stocked.—The Tyre Stockists, 21a, Store St., Tottenham Court Rd., W.C.

DUNLOP Wired Edge Covers, 26x2, also 26x2, not run 100 miles, 13/6 each; approval.—30 John Bright St., Birmingham.

MOTOR Cycle (heavy) Rubber-studded 26x2 Cover 20/-; approval against cash.—Scottish Motor Agency, 167, Morrison St., Edinburgh.

CLINCHER Rubber-studded (clearance) Covers, 26x 23/-, 24 25/-; Dreadnought studded, 26x2, 30/- A' Won ribbed, 26x2, 15/6; tubes, 26x2, 6/-; approval against cash.—Scottish Motor Agency, 167, Morrison St., Edinburgh.

British Motor Cycles and Colonial Conditions.

COMPARATIVELY few makers realise the big field and possibilities abroad for the sale of motor cycles. Further, it is the vastness of our overseas dominions that causes it to be a most difficult matter for those manufacturers who are ready and willing to cater for motor cyclists abroad to know the exact requirements of each country. This issue of *The Motor Cycle*, containing as it does valuable experiences and opinions of readers spread over all parts of the world, will do much to clear the air and possibly pave a way to a profitable business to home manufacturers, and yet delight the colonial by attention to his not unreasonable demands. Though a different model is not necessary for different countries, it is obvious that a motor cycle which will suit the roads and climate of India is frequently found wanting, say, on the veldt of South Africa.

In India the trunk roads are excellent, and the climate, although exceedingly hot at certain seasons, is not too hot to prevent air-cooled engines giving good results. On the arid plains of South Africa there are often only apologies for roads, and what track there may be is strewn with boulders. Consequently a crank case clearance that is ample for good-class Indian roads may be insufficient for South Africa. These varying conditions call for a divergence in design which makers may well be excused for shelving for a compromise. Some have introduced special colonial models, which have found a ready sale; others are content with their standard pattern, and with care this is found to give good results, although the correspondence published in this special issue proves the necessity for some modifications in design, if not

drastic changes, if our overseas readers are to be satisfied on every point. A perusal of the criticisms in this issue will form a useful guide to the prospective buyer as to the machine he wants. The opinions are also of general interest, as all riders find pleasure in following the doings of colleagues in countries abroad.

One phase of the movement which we have particularly noted in reading letters from correspondents in far-off lands is that dissatisfaction exists as to the business methods adopted by some makers at home. We are told that enquiries are often referred to a very subordinate agency where the proprietors know little about the machines they are ready to sell. Colonials also grumble that few makers mention prices in their announcements to prospective foreign purchasers, and many weeks are wasted through this omission.

It must not be supposed for one moment that the standard British mount is totally unsuitable to colonial conditions. As has been stated, it can be used in many countries without alteration, and, as a matter of fact, practically every standard British make would give the greatest satisfaction on inferior colonial roads, provided the following simple alterations were made: 28in. wheels fitted to increase crank case clearance, stronger tyres of larger section, stronger rims and spokes, more perfect and stronger spring forks and saddle springs, belt rims 1in. further from the ground. It is almost needless to add that change speed gears are generally desirable and sometimes indispensable, and low compression engines are of immense advantage.

At present the demand for motor cycles slightly exceeds the supply, but the circumstances may be reversed before long, and the alert maker and dealer will reap the reward of enterprise.

The Motor Cycling Conditions in Northern Nigeria.

ON the first occasion of Mr. Walter Wethered's visit to the tin fields of Northern Nigeria he took with him a push-bicycle. On his third visit he took an A.C. Sociable fitted up complete with a hood and screen—the latter subsequently dispensed with—but the machine was not in any way specially built for the journey. Roads are few and far between in that part of the world, and progress had to be made over the tracks worn by the feet of the native carriers in their passages to and from the tin fields. The rear wheel of the car followed the track, but the side wheels were running in grass several feet high. Swamps were encountered, and on numerous occasions a way had to be cleared for the A.C. by means of picks and shovels by the accompanying natives. At times, too, the car had to be carried entire by the natives over particularly difficult places. When roads were encountered they were not of an easy-going character, as may be gathered from one of the accompanying illustrations. Progress was consequently slow, but Mr. Wethered found it much more comfortable sitting under the hood than the alternative he had previously tried of riding horseback unprotected from the blazing sun. Despite the heat and the fact that the whole of the journey from Loko to Keffi, a distance of seventy-four miles, was done on the lower gear, the air-cooled engine did

not show any symptoms of overheating, and gave no trouble whatever.

How Time was Saved.

In order to have an ample supply of fuel, Mr. Wethered had shipped out to Nigeria 150 gallons of petrol, which was carried from the steamer up to his camp by natives. A large crowd of natives witnessed his start on the machine, which carried his bedding, but no particular excitement was occasioned by what must have seemed to them an uncanny affair. Although Mr. Wethered himself is not a lightweight, the car carried him and the mine manager, Mr. E. H. Nicholson, when on the tin fields; and as an instance of its utility Mr. Wethered states that, whereas by ordinary trekking it took some eight days to travel from the headquarters of the field (Naraguta) to the nearest railway station (Rigachikun)—a distance of over 100 miles—the manager made the trip on the handy little three-wheeler in a day and a half.

Mr. Wethered left the car on the tin fields, and suggests that the various mining companies should supply their managers with cars in order to enable them to move from point to point on their estates more easily than can be done by the present cumbersome methods of travel. So successful has the machine proved that a repeat order has been received by Auto-Carriers, Ltd.

THE IDEAL MACHINE FOR THE COLONIES

SHOULD IT BE OF SPECIAL DESIGN?

BY B. H. DAVIES

AS a correspondent pointed out recently, it is a mistake to lump all the colonies together, and imagine that the riding conditions are identical in all the oversea continents. Without doubt there are large areas in most of the colonies where a standard British tourist machine will almost ideally "fill the bill"; there are other areas, larger and more numerous, where the standard home types are seriously defective. It seems to me that the harassed manufacturer, who wishes to cater for the export demand, should be content with one conviction. He should realise that the riding conditions are almost uniformly more severe in the colonies than they are at home; he should think out the details of these severe conditions in every aspect; and he should modify his British patterns to suit.

In inviting him to tackle this process, we are only asking him to do what he has already successfully achieved in other directions. When a maker resolves to enter for the T.T., or the Six Days, or the Scottish Trials, he realises his machine will be more severely tested than it is in the hands of the ordinary customer, and he modifies his pattern accordingly. For instance, some firms who competed in the Six Days have already made mental notes of necessary improvements. They have decided to fit stronger rims, heavier spokes, thicker tyres, and lower gears to the 1912 models. In addition to these general changes, several minor details, peculiar to the individual make of machine, have been noted for strengthening. A similar process, aided by keen and thorough imagination and by the complaints of existing customers overseas, will produce an

efficient colonial model. I have never ridden in the colonies, but in this article I propose to apply the imaginative solution to this special problem, classifying suggestions under the normal heads of a specification.

ENGINES.—Certain engines give tolerable satisfaction in England, yet will never do for the colonies. They are engines which will not stand being "over-driven," which cannot be run slowly, and which do not maintain their power. Such engines are disappearing from the home market, but they suit the tamer breeds of home user fairly well, and a few continue to exist.

In some colonial areas an engine has to climb hills many miles in length, and therefore an engine which soon grows tired of full throttle will never do. A colonial rider may have to pick his path at eight or ten miles an hour over rock-strewn tracks, narrow rutty trails, or sand patches for miles together; and thus it is essential that his engine must be capable of firing regularly at slow speeds, and of climbing short pitches of steep gradient *without rushing them*. This question is not solved by fitting a variable gear; it is a bigger problem to make an engine that can keep going indefinitely on a 10 to 1 gear than to make an engine which will run slowly on a 5½ gear. Finally, the colonial rider is by no means always a mechanic, and he may live hundreds of miles from a capable repairer; therefore the engine must maintain its power for long periods.

To export engines which grow tired, which will not run slowly, and which rapidly lose their power, is to

A SO-CALLED ROAD IN VICTORIA, TEN MILES FROM MELBOURNE, SOUTH AUSTRALIA.

Very few motor cyclists have any idea of the atrociously bad roads their brethren "down under" have to put up with. The surface illustrated is not unusually bad for S. Australia, the roads in that part of the world being all more or less in this condition. The good roads are very few and far between.

The Ideal Machine for the Colonies.—

ask for unpopularity and loss of trade. For most colonial districts the engine clearance must be increased; one Australian rider of my acquaintance fastens a thick strip of felt, such as is used for typewriter pads, under his crank case for an additional safeguard.

WHEELS.—A Scotch doctor who uses his machine all the year round in the Highlands recently wrote a lurid indictment of standard wheels to a lay journal. If standard wheels are too weak for Scotland or for Yorkshire, they are too weak for the colonies. The rims and spokes cannot be too strong. The wheel bearings cannot be too waterproof, and their adjustments should be accessible and dust-excluding. The colonial rider has to take out his wheels far oftener than we have, and he does not want to reset his cones every time he removes a wheel. The wheels should be as easily detachable as possible. It is a simple matter to design a wheel so that it can be removed and replaced within ten minutes; why boggle with stupid designs which require two hours? The tyres should be $2\frac{1}{2}$ in. reinforced. The mudguards need wide clearance; if the clearance be small, as in some cases at home, the wheels get jammed with mire, and small stones lodge between guard and wheel, and rip out spokes.

CARBURETTORS.—Colonial carburettors need to be as simple, as dustproof, and as little sensitive as possible. On bad going nobody cares to be bothered with hairtrigger levers, which may be an actual attraction on dull smooth roads. The dust in India, for instance, baffles description, and soon pulls down engine tune; thus the air intakes should be safeguarded by their position, and by a proper air filter, easily cleaned. The vaporiser needs a huge range of extra air, when we consider the variations of temperature and altitude which colonial riders have to face. I should say that the 1912 carburettors with their variable jets and variable choke will prove ideal.

IGNITION.—Nothing can be better than the standard high-tension magneto. It should be absolutely waterproofed, and it should be timed on the slow side. Most makers time their magnetos a shade too fast for the home market. I find that to set the firing point, say, 2 mm. back down the stroke usually gives greater ease in starting, better climbing (especially at slow speeds), and almost the same maximum speed.

VALVES.—The exhaust valve bears the brunt of the heavier work an engine is called upon to perform overseas, and therefore the exhaust valve should be above suspicion, and should be as accessible as possible. An engine which constantly breaks exhaust valves (and so punctures pistons) under home conditions will not do for the colonies.

TRANSMISSIONS.—Colonial work is very severe on belts. In many districts dust puts the leather belt out of court, for glazing is so rapid. Heat, water, and slow running reduce the efficiency of rubber belts; further, if the low gear be of a type which necessitates a small engine pulley, a belt of small section is implied, and a narrow belt does not last long in this country, when it has slow running (*i.e.*, jerks at the fastener bolts), water, and a lot of climbing to contend with. A big belt will not do for low gears obtained by reducing pulley diameter. Whatever may

be true of England, the chain is apparently more favoured by colonials, and I think I must add the *encased* chain, when we remember the dust nuisance, and tropical rains and water-splashes and fords. Personally, if I could not find a perfect chain system for export, I should choose a belt-driven machine which gave a low gear without a small engine pulley, and I should fit as wide and deep a rubber belt as I could obtain. By the way, *partial casing* does very well for the front chain, but is not much protection for the rear chain. A skeleton case suffices to keep a front chain almost free from dust and wet and mud; but a skeleton rear case only serves to prevent rain running off the upper arcs of the tyre and guard on to the chain.

GEARS.—The colonies are best suited by a variable gear of a rather special type. To begin with the colonial rider is not infrequently baulked half-way up a severe hill. He therefore asks to be able to restart his engine. He does not want to run the machine down hill, throw out the clutch, turn round, and re-engage the clutch; nor does he want pedals, which

Scene at the Consuma Raguaglio hill-climb, recently held in Italy. The winner, Mr. Fenci (3rd Triumph), who covered the course of 16 kilometres in 16 min. 7 secs.—37 miles an hour.

are sure to suffer in his somewhat numerous falls. Further, he wants a very low gear indeed for emergencies.

In South Africa, for instance, he is sometimes faced by very severe short grades when climbing out of a river bed; and he may have no starting space apart from the gradient. Secondly, he may often be faced for miles with surfaces too bad for top gear; and it is not good practice to run a machine for miles on a 10 to 1 gear, as several of the trials men learnt over Tan Hill last August.

A three-speed gear seems to be indicated, with the middle gear as "normal"; and if an adjustable pulley gives him considerable variation of all his ratios, so much the better. If he is limited to a two-speed gear, the bottom ratio must be extremely low. The gear should not interfere appreciably with the removal of the back wheel, nor should it be liable to damage in the event of a fall. This especially applies to the control. Then, of course, the innards of the gear must be absolutely reliable. A deranged gear may spell absolute inability to complete a journey by any route.

BROOKS

There is no name of equal value in the matter of equipment—

No name with an equal reputation—

No name equally familiar in every corner of the World of Wheels.

The

Saddles

that bear it are the product of a vast experience—

They embody features unique in value and comfort-giving qualities, and—

Not the least of these is THE ORIGINAL AND ONLY GENUINE COMPOUND SPRINGS

These totally absorb vibration, yet, by their compensating action, eliminate entirely all tendency to bounce—

And that's only one of many merits, yet, to the rider, it means a certain and unequalled satisfaction—

and Bags

that bear that name are the result of a careful and sustained study of the Motor Cyclist's every need—

They are made of the finest materials—

They are absolutely weather-proof, and—

They offer unequalled facilities for the conveyance of all the impedimenta of the tour—

And those facts should induce you to ask us for further and fuller particulars.

Will you do so?

**J. B. BROOKS & Co., Ltd.,

BIRMINGHAM, ENGLAND.**

THE BROOKS COMPOUND SPRING MOTOR CYCLE SADDLE—B104.

A most luxurious saddle of great strength and comfort, specially designed to give a low riding position. The leather top is made from an extra stout superfine quality leather and perfectly shaped. It is supplied either with plain or padded top.

THE BROOKS COMPOUND SPRING MOTOR CYCLE SEAT—B250.

Low built and of extremely comfortable proportions, this seat is specially designed for motor cycles of the non-peddalling type. It is so constructed as to ensure that the position of the rider is quite clear of the cantle plate, the peak being very small, and supported by an exceptionally easy spring.

THE BROOKS MOTOR CYCLE PANNIER BAG—B466.

Made of best brown waterproof canvas on special three-ply boards and leather bound. Two leather pockets are fitted on the front, and oil and petrol can pockets on ends. A strong English lever lock secures the lid, and the bag is fastened to the stays by means of steel clips. It is made also in best selected leather.

The Ideal Machine for the Colonies.—

FRAME.—The standard British frame is almost always strong enough for solo work, and the only modifications are those which follow from increased crank case clearance.

SPRINGING.—The machine should undoubtedly be sprung fore and aft, or at least as to forks and saddle, in which case all nuts, bolts, and fittings should be robust, and if possible the nuts should be castellated and split-pinned. The springing should be designed for *bad* bumps. The normal English springing is designed for *slight* inequalities of surface. When faced with really atrocious surfaces, it is apt to bounce, clash, or may in severe cases collapse altogether.

CONTROL.—Flexible wires are entirely reliable for light work, such as carburetter and ignition control and valve lifting. In theory they are adequate for heavy work, but in practice they give a lot of trouble—possibly owing to unskilled fitting; at any rate, dozens of brake wires pull through or snap. For colonial work I prefer rod controls for the brakes, and personally I should fit duplicate control to the valve-lifter, *e.g.*, by pedal and handle-bar lever.

TANKS.—The standard oil tank holds oil for 400 miles, which is ample. The standard petrol tank only contains fuel for about 100 miles, which is utterly inadequate for many colonial areas. A two-gallon petrol tank is advisable, and it may well be larger still, so as to avoid "splitting" a can. Oil and petrol filters are desirable, and the oil pump should not be experimental.

TOOLBAGS AND CARRIER.—"Toy" toolbags are well enough for home use, but the colonial rider must carry a larger kit of tools, and a full range of spares. He must have at least two large bags, so fixed as to leave a large carrier entirely free for other luggage. The fixing of the bags must be absolutely vibration-proof. Two flimsy clips and a thin strap are no good. I have found that D nuts with a bent plate are quite safe.

FOOTRESTS.—Two pairs of footrests (*à la* T.T. model) afford four changes of position. They should be strong enough to take the brunt of a fall off the machine, soft enough to be easily straightened, and above all they should be attached independently, so that damage to them does not involve a smashed silencer or magneto drive. Any control pedals should be mounted on separate lugs, at such a distance from the rests that a bent rest cannot possibly hit them.

BRAKES.—No band brake can long retain a good surface when it has to face unlimited dust and wet. The belt rim shoe, when perfectly designed, makes so perfect a brake that no other is needed, and the elements of a perfect design are public knowledge. I hope to see chain-driven machines uniformly fitted with this brake before long; if the shoe works inside the groove, it offers no hindrance to removing the wheel. Some front rim brakes are useless; others are so powerful that a few riders habitually employ them to save wear of the back tyre.

MUDGUARDS.—The standard mudguards will suit, but should have more clearance. Even in England I have often had to dismount in winter and dig clotted mud out of my guards; while in the Yorkshire trials I frequently had stones lodge between guard and wheel. Greater clearance would avoid this, as the size of stones flung to this height by the wheel is limited. Standard mudguard stays are strong enough for England, but hardly for the colonies.

SADDLE.—Cannot be too large or comfortable.

STANDS.—Essential for both wheels. Tiny strap fixings are useless for front stands, even in England. Many stands are fixed by a host of twiddly bits, which always give trouble. A kick-operated, spring-held stand, secured by a few stout parts, is essential; it should not have a flat basepiece, or it will be useless on bad surfaces. Possibly a two-leg stand, with separately adjustable legs, such as the Clyno, may best suit residents in really bad districts.

Summary.

It should be clearly understood that the above represents my ideal for the most difficult country imaginable. I have not mentioned water-cooling, because I think air-cooling, with a low compression engine, is quite satisfactory; we may come to water-cooled engines of smaller dimensions in a year or two. In conclusion, there are two things the colonial rider values more than any theoretic perfection in the specification which is offered to him. The first is prompt, sympathetic, and generous treatment by the manufacturer at home. The second is the provision of a "live" agent within 500 miles of his residence; and by a "live" agent, I mean a clever mechanic, who will take care to "nurse" customers, who understands the whimsies of the machines he deals in, and who carries a reasonable stock of spares and replacements.

BRITISH MOTOR BICYCLES ABROAD.

A long line of motor cyclists in Johannesburg, all riders of one make of machine—the ubiquitous Triumph.

The October Quarterly Trials Course.

THE course for the October Quarterly Trials was chosen after some considerable deliberation by the committee of the A.C.U. Midland Centre, and through lack of suitable open spaces in the centre of Birmingham, it was arranged to make the starting point at the King's Head Hotel, which is situated about three miles from the city.

The course runs through Quinton, then down the well-known Mucklows Hill into Halesowen, on to the left to Hagley Hill and Kidderminster. At this point very efficient

will come as a little surprise to the unwary. Thence by country roads through Martley, Worcester is reached, where lunch is taken at the Hop Market Hotel.

Leaving Worcester through the narrow main street care must be taken not to miss the Tewkesbury Road, which bears to the right past the cathedral, and once clear of the town and on through Severn Stoke a splendid run can be enjoyed through Tewkesbury to the outskirts of Gloucester, where a sharp turn to the left must be taken direct to the foot of Birdlip Hill, which will be the afternoon test-hill. Another sharp turn to the left by the Royal George down a somewhat narrow road brings one to Leckhampton, where the route branches to the left on to Southam (Glos.). Here another stiff hill is encountered, and the route continues through Winchcomb to Evesham, and a few miles out of the latter town a sharp turn to the left will be taken for Astwood Bank and Headless Cross. Leaving Redditch on the right and opposite the gates of Hewell Park a turn to the left is taken down twisty lanes into Bromsgrove, bearing to the right on to the Birmingham Road for about a mile, then off to the left to Lickey End. The final stage here leaves the new Birmingham Road to the right heading for Romsley, thence *via* Halesowen home.

The last ten or fifteen miles are bound to be somewhat trying on account of the twisty nature of the lanes, while the approach of darkness will tend to make matters especially difficult for those who must hasten to finish to time.

FARLOW BANK (near Bewdley).

The last bend at the summit.

arrow marking will be necessary on account of the many twists and turns before striking the road to Bewdley, where the Bridgnorth Road is taken on to Buttonbridge, bearing to the left to Bradley and Bagginswood, then on to the now renowned Farlow Bank, described by some authorities as a "trick hill," but, judging from reports of the extensive practising that has taken place of late, prospective competitors are gradually learning its difficulties.

Leaving Farlow behind, the route continues across country to Ludlow, then on to Tenbury and Bromyard. Leaving the latter place a stiff rise is encountered over the Downs, and looking to the right is a good view of the Malvern Hills. A little further on the road commences to drop steadily for the next three miles to Knightsford Bridge, and, instead of bearing to the left to Worcester, continues straight on over Ankerdyne Hill, which

The lower bend on Farlow Bank, which is on a steep gradient. T. Silver recently made several clean ascents of the hill on his Quadrant.

It is to be hoped that a number of motor cyclists will lend assistance in arrowing the course very efficiently, as the trial is longer than usual. **CHIEF MARSHAL.**

ALL BLACK FINISH.

Many colonial readers have written to *The Motor Cycle* respecting all black finish, and whilst this has many advantages it has certain disadvantages which should be enumerated. The disadvantages are that certain parts of motor cycles do not take enamel as well as they do plating, e.g., a sharp edge can be enamelled, but paint does not adhere to sharp machined edges like nuts, etc., and when rubbed off the steel underneath quickly rusts and looks bad. If pedal cranks, nuts, etc., had rounded edges, it would be different.

There is, however, no reason why handle-bars, hubs, rims, brake-rods, etc., should not be enamelled, as the work is properly done at the outset, it will stand almost as well as

nickel plate, provided the paintwork is carefully handled when cleaning the machine. The disadvantages are that it is somewhat funereal, and if done in colours the life of the paintwork is reduced, partly because it is not an easy matter to stove coloured parts and get them as hard as black, and also because coloured enamels are more expensive in initial cost of material and in their application to the frame and other parts. The processes of stoving are slower on account of the delicacy of the colours as compared with black, and for reasons which we need not enter into here, black enamel, when properly stoved, has a harder and tougher surface than colours because the ingredients will stand a greater heat.

**"BEST
AFTER
TESTS"
OVERSEAS.**

THE British Built "Bat" has been tested as strenuously and as consistently abroad as in England and with equally successful results. In all countries, under all conditions, the "Bat" has proved its sterling worth all the time. Its unique features, which are especially adapted for foreign and colonial service, account largely for this, including the famous : : : :

➤	BAT SPRING FRAME. SPRING FORKS, PROTECTED	➤
➤	MAGNETO IN TANK. AUTOMATIC LUBRICATION.	➤
➤	CORRECT SADDLE POSITION. GOOD GROUND	➤
➤	CLEARANCE. BAT-J.A.P. ENGINE. : : : : :	➤

Remember—the "Bat" won Two Gold Medals, also the Fastest Hill Climb Prize in the Scottish Six Days' Trials, and also made a perfect score in the A.C.U. Six Days' Trials, securing Gold Medal.

Further Appreciation of the **ROVER**

To
The ROVER COMPANY LIMITED,
COVENTRY.

105, Grandison Road,
NEW WANDSWORTH, S.W.
September 25th, 1911.

Dear Sirs,

The frame of my machine is No. 31137 and the engine No. 684; I bought it from your agency in Holborn late last July and the next day I had it I rode 213 miles without a hitch.

A fortnight ago I went from Cromer to Newhaven, crossed over to Dieppe, went to Paris, Amiens, Arras, Douai, Lille, Armentieres, St. Omez, Calais, crossed over to Dover, came back to London, and all this without any trouble of any kind except punctures, which I quite expected as I went over some nasty rough bits of roads.

Not knowing your make of engine I intended to purchase another well-known kind of cycle, but I am very pleased to be in possession of a "Rover." It has now run close on 1,500 miles without even having to touch the sparking plug.

Wishing the best success to your firm,

I am, Sir,

OLIVIER BRISSE.

THE ROVER CO., LIMITED,
COVENTRY.

Occasional Comments

By "Izion"

Lamps and Winter Riding.

I always read the American motor cycling papers with much interest, and of late I have noticed one point in which they offer us a useful lead. Generators seem quite out of fashion over there. Instead of these devices the up-to-date Yankee carries what he calls a "Prest-o-lite" tank, i.e., a metal cylinder of acetylene gas, presumably of the "dissolved" type used by some car owners in this country. The cylinder weighs 7 lbs., and measures about 12 in. by 4 in.; it carries sufficient gas for forty hours night riding, and is fitted with a gauge at one end to show how much gas remains. The first cost of a fully charged cylinder is £2, and empty cylinders can be exchanged for a small fee at depots all over the country. A similar device made somewhat smaller might become very popular on this side.

Endless Belts.

My family have often been tempted to hail me as a heaven-born genius, but so far they have waited for the crowning proof, to wit, one of those eccentricities which hall mark real genius for ever, such as Newton's cutting the large hole in his study door for the cat and another smaller hole for the kitten. The other day when I put a pinch of baccy in a puncture and stuffed a Surridge's Holdrite in the bowl of my pipe I thought I had established my reputation, but they decided I had done this of *malice prepense*.

To-day my eldest boy, who rides an 8 h.p. Bat, came rushing in, waving a copy of *The Motor Cycle*, and shouting "Dad, you've put your foot in it this time!" and pointing out "Faust's" humorous strictures on my endless belt notion.

I seized the impertinent young hopeful by the ear, led him sternly out to the garage, and showed him how the bolted up construction of *my* rear frame enabled me to fit an endless belt, without taking the heroic measures suggested by "Faust," and hack-sawing through a brazed-up chain stay. But I am a forgiving man, who bears no malice, and if "Faust" will send me his address, I will present him with a tube of Seccotine to mend his sawn frame.

Of course, the endless belt would not be applicable to every make of machine. The belt has to be inside the rear fork, and outside the chain stay. The easiest machines for the purpose would be the old Triumphs, in which the spindle ends of the chain stays and rear forks were loose and separate. But if there proved to be any real advantage in endless belts, as the second detail of chain-cum-belt drive, all standard frames could be easily adapted to take them.

Already the joints at the bottom bracket and saddle pillar are bolted joints; on some machines there is a brazed lug between the chain stays near the mudguard tail, and another brazed bridge piece between the rear forks, to carry the upper arc of the mudguard. These two bridges could easily be bolts, instead of brazed lugs.

A False Paradise in the Lamp World.

My note upon modern lamps has brought me a great deal of correspondence. My readers seem to agree that in solidity of construction the average modern lamp is beyond criticism. The illuminative qualities of several makes of lamp are universally condemned, and in this respect my experience is evidently by no means unique, a number of users agreeing that cheaper lamps, produced several years ago, give a better and more penetrating light than some of the more up-to-date patterns.

But I notice that, whereas one correspondent has no praise good enough for this make or that, a second correspondent roundly abuses the very same lamp which a fellow-rider has found so satisfactory. Evidently the quality of separate samples of the same make varies; an inferior lens or an inaccurate focus prevents a particular sample from giving good results. Evidently some of the lamp makers ought to test *their* products more carefully before delivery.

There also seems to be a demand for larger generators. Judging from my postbag, quite a number of riders occasionally indulge in all-night pleasure rides. But this demand strikes me as mistaken. None of us needs a six-hour generator more than two or three times in a season, and why be permanently burdened with such a gigantic appendage for the sake of two or three rides? A better tip is to use a three-hour generator, and on all-night rides to carry a pedal cycle generator or an electric torch to provide light while the main generator is cleaned out and refilled.

A SCENE IN NYASSALAND.

The Editor does not hold himself responsible for the opinions of his correspondents.

INTERESTING COMMUNICATIONS FROM READERS IN FAR-OFF LANDS.

Below we publish a selection of letters from Overseas Readers of *The Motor Cycle*, a number of whom detail their ideal specification, and otherwise give useful hints on the production of the perfect colonial mount.

A Voice from the West Indies.

[5942.]-I enclose a photograph of a friend and myself, on our way to inspect some caves. The machines are a T.A.C. and a Triumph, the latter of rather an ancient model, but none the less wonderfully reliable and serviceable, trustworthy to a degree. In the picture, we have left the road to garage our mounts at the mud hut shown, as we have to make our way through the bush in the background on foot.

If motor cyclists in England only knew half the difficulties we in the colonies have to contend with I am sure they would sympathise with us and count themselves favoured mortals.

In addition to the unavoidable set-backs and tribulations attendant on the sport in any part of the world, we have to put up with many disappointments in ordering goods from home, which are by no means the least disheartening of the trials we undergo.

As an instance I will relate the most recent experience which has fallen to my lot, and which is by no means a solitary specimen of our bad luck. Our horns are not sufficiently loud to be heard by the local cartmen, whose vehicles make such a clatter that all ordinary sounds are quite drowned by the noise they make, so that, on overtaking them, it is necessary to ride right up to the back of the cart and yell before they can hear. This means that the machine has to be stopped and started again when they have drawn aside sufficiently to give room to pass on our narrow roads. (Oh, for a free engine!)

I decided, therefore, to invest in an exhaust whistle, which, after waiting the usual two months for delivery, arrived too big to fit my exhaust pipe. I did not get an opportunity of going to Kingston (the chief town of the Island, where only the adjustment could be made) for some months, and then I was advised by the engineers whom I consulted that a new clamp to the whistle, which would cost far more than the whistle itself, would be absolutely necessary, and even then it would be doubtful if the whistle would blow unless a plate to deflect the gas was in some way arranged to work in the exhaust pipe. The risk of having a permanent hole in this pipe, without being able to use the whistle, was too great, so the latter has had to be scrapped.

Can you tell me why head lights are made with the ventilation holes in the front of the cowl and not at the back, and do they work properly so fitted in England? I always have to tie my handkerchief over these holes when riding at night, when a bit of paper is not available, to prevent the wind making the flame flicker and often blowing it right out.

Two shillings a gallon in Kingston is the price of our petrol, and three shillings thirty miles from that town, owing to the heavy railway charges. At this rate it is cheaper to pay a boy sixpence to clean our crank cases than to adopt the plan of squirting them (the crank cases) with gasoline, as it is called here, as suggested by a correspondent in your issue of the 3rd August.

Wishing your interesting paper the best of luck,
Jamaica, B.W.I. ALLIGATOR.

The Prevailing Conditions in Canada.

[5943.]-Manufacturers would do well to note the requirements of the Canadian riding public, as here is a field of great possibilities. First and foremost is the distance from place to place, requiring locomotion of some kind by the business as well as the pleasure seekers. Travellers are in want of some reliable motor cycle that is suited to the conditions of the road bed. I offer a few suggestions at random. Medium-powered engine consistent with weight; long wheelbase; large size wheels, 28in. x 2½in. seems the most suitable; a saddle fitted that will stand heavy road shocks; spring forks, with a minimum of working parts that are liable to work loose; handle-bars of a V pattern on a level or nearly so with the saddle; and last, but not least, a spare set of parts with every machine sent out—such as valves, springs, small nuts, brake parts, and pedal pins.

The medium-powered machine seems the most popular, as being within the reach of all is in its favour, also riders who could well afford high power models would prefer to ride the medium for several reasons. It will suit the city traffic, while not taking any material power or speed away that is required on the country roads.

Long wheelbase and large size wheels are by far the most suitable. One cannot judge by country roads such as are to be found in England. Here one gets good hard clay or gravel roads, but in long stretches the road is covered with sand, sometimes three or four inches deep. In these spots it is difficult to manipulate an English model with low wheels. Often the belt rim strikes the ground when the rear wheel goes in ruts cut by farmers' carts, trucks, etc. On the other hand, a 28in wheel and 2½in. tyre slips over with ease and safety to the rider.

A Triumph and T.A.C. outside a mud hut in Jamaica. See "Alligator's" letter.

Kempsey, N.S.W., Australia.

May 26th, 1911.

The L.M.C. Machine is a great hill climber. The mountains here rise to over 4,000 feet high. My work lies among the mountains, and there is no hill that has beaten me yet. I can even make up speed on a hill and tackle some of the stiffest from a standing start at the foot of the hill. I am doing nearly all my work on a 1911 L.M.C. as I did in Wallaroo, and have not had the slightest trouble.

Quetta, India,

June 8th, 1911.

I am glad to say I find the L.M.C. machine a very good one. There are 6 or 8 ——— here, but from what I have seen of them I prefer the L.M.C.

L.M.C.

COLONIAL TESTIMONY.

Bombay,

June 16th, 1911

I am extremely pleased with the L.M.C. Cob. I have used several machines during the last 10 years, but never one to approach this in comfort and reliability.

Port Augusta, Australia,

July 6th, 1911.

You will see I am in Port Augusta. I came through on a 3½ h.p. L.M.C., in company with Mr. ——— on a 3½ h.p. ——— and they were the first two Motor Cycles through from Cowell as the track is very sandy. We came through in one day, actual travelling time six hours doing 120 miles. I had not the least trouble getting through the sand, and can safely say my machine is the better of the two.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Other things are also needed if the English maker would wish to keep the Canadian market. Among them are better quality in the fittings used, such as the valve lifter, expander bolt in the stem of the handle-bar, and the use of a strong saddle clip. Things like these are necessary owing to the distance one may be from a town. To the manufacturers who take the chance which is open now to capture the Canadian market an immense trade is ensured owing to the popularity which the motor cycle has gained.

Toronto, Ontario, Canada. MAN ON THE SPOT.

A New Club in Perth, Western Australia.

[5944].—A line from this distant part of the world regarding the pastime may be of interest to your readers. We have just recently formed a club in Perth which makes the second in Western Australia. The writer was a member of the first motor cycle club in this State formed at Kalgoorlie a few years ago, and which had a membership of about thirty. The Perth Club has about the same number, and is gaining recruits daily. People are beginning to realise the utility of the petrol engine for business purposes, and with the added interest the club is beginning to arouse I feel that the sport will rapidly grow. As an experienced rider and constant user of our country roads and back tracks, I am delighted to see the enthusiasm with which the Perth riders have taken up the pastime.

In two or three tours already made members have found that the average country road is quite capable of negotiation by any modern mount and a little skill and nerve on rough hills or heavy sand patches. Given sufficient h.p., a two-speed gear, and some practice, almost the whole of this great State could be traversed. In the early days when some of the pioneers stated this, people looked wise and smiled at us—we have since shown them how to do it, thanks to the great improvement in modern motors. For lots of our work we need heavy tyres, stronger rims, change-speed gears, chain transmission, and tanks of liberal capacity. We can ride here all the year round with the exception of a very few days. Heat is our greatest drawback—in our worst weather one longs for a water-cooled engine and automatic lubrication.

The enclosed photograph taken at Coogee on a recent "Billy" run shows that we have some of the best types of machines represented, amongst them being Triumph, Humber, Rex, Brown, V.S., Peugeot, F.N., Hobart, and Minerva. Besides these there are running in the State P. and M., Scott, Roc, Rover, Douglas, Moto-Rève, Bradbury, and Motosacoche.

The writer is shown on his Triumph with his eleven year old son seated astride the tank; so carried he has done hundreds of miles over all sorts of roads. He began before he was five years old. He can now ride and manage the levers perfectly, but is not yet strong enough to start the machine. He is promised a lightweight two-speeder, which type under a sound specification is bound to be exceedingly popular with a large percentage of riders in the near future.

Out here there is a little band of enthusiastic readers of *The Motor Cycle* whose whole knowledge of the great events in the motor cycle world is limited to the reports you publish, but through them we have come to know the Colliers, Newcome, Godfrey, McNab, and the whole brilliant array of talent of which you can boast in England, and we think of them as personal friends because of their allegiance to a common hobby. We rejoice in their successes, and grieve when ill luck snatches a well-deserved victory from any of them.

Perth, W. Australia. A. N. McDONALD.

A Comparison between Car and Motor Cycle.

[5945].—Mr. Davies's account of the A.C.U. Six Days' Trials is most entertaining, and gives an excellent idea of what actually happens on a hard ride.

For the past six years I have ridden motor cycles off and on in this country and in England, my mounts, one of

which I still possess, including representative makes from England, Germany, and America. I find the sport most enjoyable, but I have never found the machines reliable.

I used to think that it was my own bad luck or mismanagement, but when such an expert rider as Mr. Davies, on such an excellent mount as the Rudge, in such a short distance as one thousand miles, suffers a clogged jet, a loose inlet tappet, a broken belt twice, several broken inlet springs, four broken fasteners, and a demoralised valve-lifter, not to mention such a little thing as a seized engine, I am beginning to think it is "in the engine."

At present I am driving a small moderately-priced American car, and have covered ten thousand miles in the past year over all kinds of roads, some of which would make the Scottish Trials look like an outing of the W.C.T.U. Only once have I been stalled on the road, when the camshaft suddenly snapped without warning, although, to be sure, I had been travelling at over forty miles an hour for more than an hour before. Of course a car is much more expensive than a motor cycle, but when one considers that five people may be carried in perfect

PERTH MOTOR CYCLISTS. Members of the second club formed in Western Australia. See letter No. 5944.

comfort, in rain or shine, it does not seem so much.

I write this not to discourage motor cyclists, present or prospective, but in hopes that manufacturers of motor cycles will awaken to the fact that the car industry is advancing rapidly while they are standing still, and that they will have to reduce their prices and improve their product if they wish to hold their customers.

I still look forward to the day when the rapidly improving roads and the slowly improving machines will induce me to forsake my trustworthy car for the more exciting two-wheeler.

ELSWORTH H. GOLDSCHMIDT.

Lynn, Mass., U.S.A.

A Suggestion to Home Manufacturers from Australia.

[5946].—There are many very appreciative readers of your paper in Australia, and many enthusiastic motor cyclists. We envy you your good roads, but not your climate. We also envy you the prices at which you buy machines. Here we pay £65 for the machine advertised at your end for £48 to £50.

There is, of course, twenty-five per cent. duty, but this is on the wholesale value. I wonder some English manufacturer with a reputation does not start assembling his machines in Australia. The engine (complete) would pay twenty per cent. duty, but the rims, lugs, tubes, ball heads, bottom brackets, cranks, hubs, spokes, etc., etc., come in free, and the saddles at ten per cent. if British.

The amount of work to be done here is only brazing, portion of plating and enamelling, and would cost little; and the saving in duty would be great. The population available in Australia is about 4,400,000, and although it is small it has a very high purchasing power. I am sure that a machine like the Rex, Matchless, Triumph, or any standard make assembled here could control the Australian trade, and still reduce the price.

E.T.H.

Melbourne, Australia.

INTERESTING COMMUNICATIONS FROM READERS IN FAR-OFF LANDS.

Below we publish a selection of letters from Overseas Readers of *The Motor Cycle*, a number of whom detail their ideal specification, and otherwise give useful hints on the production of the perfect colonial mount.

Standard British Machines Suitable for Toronto and District.

[5947].—As regards specifications for motor cycles for use in the country surrounding Toronto, the Triumph suits us in every particular, both as to ground clearance for engine and reliability, and is our ideal specification. Our greatest objection against this machine is the inability of the makers to supply. We have not had a machine on stock to sell this year, all being sold before received.

Toronto, Canada.

TANGENT CYCLE CO.

A London Club-house Suggested by a Rhodesian Reader.

[5948].—It is with real joy that a few of us motor cyclists read your valuable paper, which not only keeps us in touch with all the latest models and inventions, but makes us feel that, after all, we are not really "off the earth," but can actually see and follow the various events which once on a time formed a part of our life in the old country. My real object in writing is to ascertain whether colonial motor cyclists could not have a club-house in London. It is just what visitors to the old country want—a headquarters, in fellowship with kindred spirits interested in the finest sport in the world, also to obtain information *re* tours, interesting runs, and general assistance, applicable not only to those who visit from the colonies, but to recruit from the ranks of cyclists those interested in motor cycles. Subscriptions to overseas members certainly should include a copy of *The Motor Cycle*. I feel certain that this is just the very thing wanted, and would be welcomed by hundreds of motor cyclists all over the world. Further opinions from colonial adherents would be highly interesting, and would also give some guidance to officials at the head of affairs.

F. T. ROCHESTER.

Bulawayo, Rhodesia.

A Novice's Experiences on Jamaican Roads.

[5949].—You may remember that I wrote to you about taking over a motor cycle to Jamaica, and I finally decided to do so. I had to pay a duty of one-sixth of its value and then take out the necessary licences—for driving 5s. per annum, road tax 6s. per annum, and registration 5s. The cycle carries two numbers—the registration number large in front, and the road tax number small in the rear. Petrol is 2s. per gallon sold in odd amounts, or ten-gallon American drums holding about eight gallons. I have now done 100 miles, including a sixty mile run.

The machine is a second-hand 1910 Enfield, which had done about 500 miles. The tyres I have on now are Fox 24in. rubber-studded back, and Continental 2in. with Fox three-rib retread front. I brought out a new five-ply 5in. chrome leather belt, a rubber belt, and an old Watawata which I had discarded for the I.R. belt, as the Watawata bottomed on the engine pulley. I had, however, scraped the sides well, and putting a small nut over the rivets had hammered down the top plates and reheated the rivet.

As soon as I got here I put the new leather belt under a stretch of 40-60 lbs. for over a week, using the rubber, but I could not get a good drive, and found that it was bottoming. I put on the new chrome leather and went four miles, stopped on business, then tried to start uphill. No use. Tried downhill. No use, the belt would not turn the engine fast enough, although it was tight. So I changed to the rubber and pedalled up every slight rise, the engine roaring round.

In despair I put on that old Watawata and all went well, so I started on the sixty miles run. Roads dusty, paved in stretches with unrolled stones, abounding in hairpin corners on stiff gradients, yet the engine and belt took the lot. I have not seen Amulree, but from the pictures some parts seemed about as stiff in gradient, but imagine a hill about an average of 1 in 8 with a hairpin bend every fifty yards.

I am going in for a Harris tree engine clutch, and then I can crawl over a rough patch instead of walking and pushing or running with the engine running. I should like to thank the three firms mentioned for the way in which their articles have stood, also to advise users of the Watawata not to throw the belt away when it bottoms. Just find an old nut which will clear the rivet and rest on the washer and apply a good heavy hammer first to the nut while on the

washers, and then to the rivets. The belt will then run some hundreds of miles further.

As far as I can see, a motor cyclist out here needs a light machine with certainly a free engine and plate clutch or two-speed and similar gradual engagement clutch. The whole of the working parts should be enclosed to keep out the fine chalk dust which lies thickly on the more frequented roads. Goggles should cover as little of the face as possible; one finds perspiration running from under the indiarubber sort in half an hour.

R. E. JEFFERSON, M.Sc.

Kingston, Jamaica.

A Lady Motor Cyclist in Pietermaritzburg.

[5950].—It is a very uncommon sight to see a lady riding a motor cycle in Natal but the enclosed are photographs of Miss Mabel Murphy, who recently joined the ranks. She is the only lady motor cyclist in Pietermaritzburg, and she rides a 1910 Triumph.

A few minutes' instruction in the use of the levers, with the machine on the stand, gave her confidence enough to venture on the road, and after a trial run of a few hundred

Miss M. Murphy, the first lady motor cyclist in Pietermaritzburg.

yards she accompanied her gentleman friend for a thirty five miles ride, and since then she has had many delightful spins.

She rides with an ordinary skirt, and she has no difficulty in getting on and off the machine, because she can reach the ground with both feet while seated on the saddle.

She is only sixteen years old and is a fearless rider, and finds motor cycling very enjoyable and much simpler than she thought it would be.

M.B.H.

Pietermaritzburg, Natal.

A Suitable Specification for New South Wales.

[5951].—Having read several accounts in *The Motor Cycle* of what kind of motor cycles are suitable for Australian colonies, I would like to say a few words regarding my nine years' experience while riding different makes of motors. The roads leading into some of the principal towns in New South Wales, and many roads at that, are simply indescribable and impossible to ride on in wet weather. The machine I would recommend is a powerful 3½ h.p., 5in. ground clearance, extra heavy wheels and spokes. The wheels, spokes, and frame are the weak points, and there could be no better illustration of this than the reliability trial from Melbourne to Sydney in January, 1911. There were twenty entries representing all the leading makes, including five of one very popular make. The distance is close on 600 miles over extremely bad roads. Only one machine, a 3½ h.p. 1910

SERVICEABLE SERVICE SPECIALITIES

**Hundreds of Novelties. Everything
for Motor Cycling. Lowest Prices**

The 'Service' Posthorn.

The finest road clearer made. Gives a loud, deep, penetrating note. Fitted with extra strong clip. Best finish. Price 13/6. Fitted with dust gauze 14/6. Send remittance for one on approval.

Special Agents for F.R.S. Lamps.

Large stock of Lamps and Generators of all makes. Your old lamp taken in part exchange.

SPECIAL OFFER.—26 x 2½ Extra Heavy Good Service Rubber Studded Covers, 32/6. Reduced price, 29/6.

26 x 2½ Good Service, Lock Join, Butted Tubes, 11/6. Reduced price, 10/6.

Busha Belt Punches. All sizes. Complete with six bushes, 2/6. Reduced price 2/3.

Complete Catalogue of Motor Cycles, Accessories, and Clothing, free on request. The largest ever issued in the trade.

THE SERVICE CO., LTD.,

"Service" Belting.

The very finest for Winter use.

No dressing required.

1/9, 2/2, 2/3, 1in. 2/6, 1½in. 2/9.

THE "SERVICE" COLD- WEATHER JACKET.

Yorkshire Frieze.

Body and sleeves lined leather. Fitted with windcuffs, 33ins. long. Clearing at 21/-.

NEW OILSKIN SUITS.

Guaranteed not to stick or crack. Price 25/-.

THE "SERVICE" OVERBOOT.

Black or Tan, water-proof chrome leather, 18/6.

THE "SERVICE" TROUSER OVERALLS.

Fawn shade. Double texture. Seams stitched and solutioned. Price, 13/6. State inside leg measurement. Jackets to match 16/6.
Grey Allweather Suits, usual price, 26/6. Sale Price 21/-
Fawn Waterproof Leggings, 8/6. Sale price 6/9
Fawn and Grey Waterproof Leggings (job line) 4/8½
Rubber Goggles, with spare lenses. Usual price, 2/6. Sale price 1/3
Jaeger Balaclava Helmets, usual price 3/6. Sale price 2/9
Fur Back Gloves, usual price, 10/6. Sale price 5/6
Tan Leather Gaiters, whole blocked spring tronts, usual price, 9/6 Sale price 5/9
Canvas Cleaning Gloves, with Gauntlets, 3 pairs for 1/6
The Service Everclean Collars, 3 for 1/6
Black Leather Waistcoats, with sleeves, double-breasted, lined, clearing at 22/6
Jaeger Wollen Scarfs, usual price 3/11. Sale price 2/11

THE REFLEX-CLIPPER "IDEAL" TYRE FOR MOTOR CYCLES.

WHAT'S IN A NAME?

Respecting Tyres—the name Reflex-Clipper stands everywhere as the hall-mark of excellence. The Reflex-Clipper "Ideal" Tyre for Motor Cycles gives fullest expression to that sentiment.

Just notice the build of it. Made entirely on Car Tyre lines. Of perfect proportions. Has weight where most needed, yet A1 for speed. Is secure against side-slip, and stands foremost in the quality line.

Price of Tyre	£2 8 0
Price of Cover	1 18 0
Price of Tube	10 0
(For 26 x 2½ Beaded Edge.)	

For best Motor Cycle Accessories
always ask for "CLIPPER" Brand.

THE CLIPPER TYRE CO., LTD.,

52-60, STEELHOUSE LANE, BIRMINGHAM.

LONDON—18, Chiswell St., Finsbury Square, F.C. COVENTRY—Alma St

In answering this advertisement it is desirable to mention "The Motor Cycle."

Bradbury, came through the trying ordeal without a defect of any kind. The troubles with other motors were buckled rims, broken spokes, and defective frames. The engines in every case were very reliable. The handle-bars could be made stronger, also the spring forks. The Druid forks are very popular here; in my opinion—and I am a practical engineer—they are absolutely the best on the market, and especially suitable to Australian roads.

Motor cycling is going ahead out here in leaps and bounds in more senses than one, and the whole cry of the agents is that they cannot get supplies fast enough. I suppose while this demand continues the makers will not alter their machines to suit Australian conditions. You have the roads, Mr. Editor, but for riding conditions nothing can surpass the Australian climate.

J. HECKENBERG.

Yass, N.S.W.

A Novel Passenger Machine used in the Transvaal.

[5952].—We have pleasure in sending you a couple of photographs of an arrangement for carrying passengers which we have just recently completed, which, we think, may be of interest to some of your readers. The idea is quite original, as we have never seen or heard of anything in the way of two motor cycles being coupled together either for passenger or any other use. You will notice that the two machines are connected up by means of five rods and one for steering purposes: the manner in which this is done is easily seen in the photographs. The handle-bars of the one machine are taken out and fixed in a bracket on the top tube, and a steering pillar is put in their place, connected by a rod to the handle-bars of the other machine. As regards steering, we find this to be quite as easy as an ordinary sidecar attachment, and we can easily maintain a speed of 30 m.p.h., though the roads in this country are not conducive to comfortable riding at this rate, especially as we have only 2½ in. tyres fitted at present. This drawback we are overcoming by replacing with 3 in. steel-studded Continentals fitted to our existing rims. Another difficulty with our carrette is that we have no free engine and two-speed gear for starting purposes.

A special switch had to be made for cutting out the two magnetos simultaneously, and is fixed to the steering machine. The seat for carrying the passengers, two in number, is bolted, on either side, to the carriers on the machines, and is upholstered in green pegamoid; two drawers are fixed underneath for carrying spares and refreshments, should we intend going out for a good long spin.

We think we are justified in claiming this idea to be the first of its kind, as every time we take the machines on the road we create quite a sensation. Some weeks ago we took a run over to Pretoria, and there again had to run the gauntlet of people standing in the streets and

Loaded up. The twin cycles referred to in letter No. 5952.

staring after the uncanny contrivance on four wheels.

We feel quite pleased with the result of our handiwork, commenced more or less as an experiment, but which has turned out a very great success.

The machines are respectively as follows: That on the right of the photograph 5.6 h.p. New Comet (gear 4½ to 1), and on the left 7.9 h.p. New Comet (gear 4 to 1), both fitted with Peugeot engines.

J.H.S.W. AND C.A.M.

Johannesburg.

In Praise of a Mount used in India.

[5953].—I have read so much regarding motor cycles for colonial use in your valuable paper lately that perhaps the following may interest your readers.

I have been using a 2½ h.p., two-speed, shaft-driven F.N. for the last six months, and I have nothing but praise for it. For the last two months I have been running it with a Millford sidecar, and although the roads here are anything but good, it has given entire satisfaction, which speaks volumes for the shaft-drive and clutch.

Recently I drove the cycle, with sidecar and passenger, into the district a distance of twenty-three miles and back on the worst roads possible, and except on two or three very steep hills, where I had to help the engine a little, it ran splendidly.

Riding solo, I have been up Chamundi Hill, a steady rise of about three miles of about 1,000ft., with some very sharp hairpin bends, and without pedal assistance. In some places it was very steep, and I found that the machine could gather speed on the low gear on any part of the hill.

I have used the F.N. without sidecar on some of the worst roads in India, in which country carts find it difficult. I do not think there is anything to beat this machine for use in the colonies and in India. If I was going in for a new combination I think I would go in for a four-cylinder 5.6 h.p. of the same make, and with two-speed gear; but for solo work the 2½ h.p. is the machine.

C. THEOBALD.

Mysore, India.

Gleanings from a Sojourn in Tasmania.

[5954].—Having only recently returned home from a trip to Tasmania, the Garden State of the Australian Commonwealth, I am venturing to recall to the memories of regular readers of your estimable journal a most interesting letter contributed by Mr. Cecil Dyer, of Laurens on, Tas., which appeared in *The Motor Cycle* in October 1908.

Mr. Dyer's epistle dealt at some length with the troubles and difficulties attendant on the path of the long-suffering motor cyclist in that far off land, and I recollect that it aroused considerable interest in my mind at the time, as I had already contemplated journeying to Tasmania, and here,

A novel passenger machine which consists of two motor cycles coupled together.

ROAD RACE IN VICTORIA, N.S.W.

James Gorman (3) T.T. Premier, winner of the ten-mile road race held by the Victoria M.C.C. on August 5th last, near Melbourne. His time was 11 min. 20 secs., which is particularly good considering the condition of the road surface.

I thought, was an excellent opportunity of acquiring certain information about the country which I desired to obtain first hand.

I took the liberty of writing Mr. Dyer, stating my wants, and in due course was the recipient of a most cordial and helpful reply. After some further correspondence, I sailed for "Tassy" in the mail boat "Osterley," leaving England on Christmas Eve, 1909, and shook Cecil Dyer's hand for the first time on February 4th, 1910, after a fine trip occupying about six weeks.

Having been a motor cyclist myself prior to my leaving the old country, and Mr. Dyer's motoristic enthusiasm dating from ancient history, and having stood the test of time well, my new found friend and I naturally had a never wearying subject of common interest for discussion. Although at the time when his contribution was published in the "Blue 'Un," Mr. Dyer was an enthusiastic member of the twin "Vindec" coterie, he has since invested in a "Triumph," and has, with the exception of a small spring fork grumble, nothing but praise for his hefty single-cylinder mount.

On it he goes snorting up the precipitous mountain slopes which abound in most parts of the State, scaring the

wallabies and kangaroos, and bound for the trappers' camps and the valuable opossum and other furs which are to be purchased there, and which, amongst other multifarious lines, he has dealings in, or I believe I should say "had" now.

Although motorists are not so heavily taxed in the Commonwealth as in England, motor cycles are naturally scarce in comparison, as the country is only as yet thinly populated, and the heavy duties on imported machines puts the selling price out of the reach of the majority of the corresponding class to our motor cyclists here. Thus, a "jigger" costing about £48 at home would be retailed at £65 to our colonial friends, and although Australia is popularly supposed to be a veritable land of Goshen, yet not many of those who at present use the humble push-bicycle could afford to plank down sixty-five of their hard-earned yallerboys for a brand new jigger. Further, many people fight shy of it for the simple reason that the undoubted merits of the self-propelled bicycle have not yet become universally known out there, and it will, probably, be a matter of time before this desirable climax is reached.

A. M. POLLARD.

Late of Launceston and Wynyard, Tasmania.

A Motor Cycle for Professional Men.

[5955].—As a medical man who has been keenly interested in your columns since your paper has been established, and yet has never possessed a modern motor bicycle for the simple reason that one has not yet been designed which seems

A sidecar-attachment made to special order by Mills-Fulford. The rear portion is detachable as well as one of the wheels and the handles, and hey presto! the motor cyclist has in a few minutes a sidecar attachment for his motor bicycle.

to meet his practical requirements, may I be allowed to state briefly what I consider to be the essentials of a machine which would meet with a ready market among home and colonial country doctors.

For the country practitioner a single-track motor bicycle, if suitably designed, would be a great comfort and blessing. However, so long as it is necessary to wear the present type of "overalls" in order to keep clean the market will be very limited, as what busy doctor can afford the time, even if he had the opportunity, to divest himself of his dusty or mud-bespattered garments every few minutes or so as each patient is visited, and if not, what impression at the sick bedside, say of a sensitive lady patient, is he likely to make if he disregards his personal appearance and suddenly appears like a mudflat diver?

My idea of a machine to suit me is as follows: The top stay tube must be abolished (as in ladies' machines) so that I can wear a long overcoat, dustcoat, or macintosh, which will protect me from dust or weather down to my boots, and which I can divest myself of in a moment on entering the hall of the house. As the flaps of the coat might be singed or soiled by the engine (as at present designed) the latter should be encased, and as this would interfere with air-cooling, water cooling should be substituted. Worm drive (as in T.A.C.) to avoid belt and chain trouble, bucket seat (not saddle) as in T.A.C., and broad footboards amply to protect feet; also a broad wind shield might be fitted, like an apron to the front stay bar—this would make it as cosy as a car: h.p. 6 to 7. The engine silent as possible, e.g., four-cylinder T.A.C. or twin Scott, Armstrong three-speed hub and free engine clutch. Hand starting device as in T.A.C. or similar

MOTOR CYCLING IN RUSSIA.

Crossing the Schelok River by a small boat at Schemskaja, a point midway between Stary, Russia, and Novgorod. The width of the river is half-a-mile, and the surface being choppy the crossing is usually rough. The machines are a Triumph and N.S.U., which are found quite satisfactory for use on Russian roads.

(no stooping down), extra strong rims and spring forks. T.A.C. springing, sidecar attachments (for the doctor's wife occasionally), Palmer tyres, and butt-ended tubes. Speed, 3 to 30 m.p.h. quite sufficient for business needs on bad roads. All parts where possible to be enamelled, not plated. Self-generating electric light for lamps, ample clearance from road of all parts (but not too much), say 7in.

The machine should look "De Luxe," cost about £60, and the doctor would appear no more undignified than a horse rider appears compared to the occupant of a brougham. My remarks apply equally forcibly to commercial travellers.

Auckland, New Zealand. C. B. ROSSITER, F.R.C.S.

A Tyre Tip.

[5956.]—I have something to tell which must interest all motor cyclists who ride a heavy machine or use a sidecar. A friend of mine, a brother of the community and clever mechanic, has hit upon an excellent way of avoiding all tyre troubles. He simply doubles the thickness of his covers.

If they are the beaded-edge type he cuts off the bead of the inner one and fits another over it without any further modification. If the wired variety, he cuts off the wire of the inner one, but as this kind of cover has a trick of constantly revolving round the rim, he is obliged to rivet the covers together on both sides with ordinary copper rivets. He tells me that since he began to treat his covers in this way, he has had no puncture or burst. I must add that his mount is a four-cylinder F.N., and that he sometimes does as many as 300 miles a day for business on the nice *paré* of the North of France, and always at full speed.

Rouen, France.

P. GOCHE.

ORDINARY CORRESPONDENCE.

[Owing to the large amount of space devoted to letters from overseas readers, we are obliged to withhold a number of ordinary letters until next week.—Ed.]

The October Quarterly Trial.

[5957.]—With reference to the speed regulation of light-weights competing in the Quarterly Trial in order to qualify for a first-class certificate, Mr. Whitworth states that the regulations require a speed of fifteen miles per hour for engines not exceeding 300 c.c., and above 300 c.c. twenty miles per hour. As a matter of fact, this is entirely wrong, as the regulation which he instances refers entirely to the special prize awarded at the end of the year for the best all-round performance in all four trials. In the event of two machines having made non-stop runs in all four events, then the machine which had adhered closest to the stipulated speeds uphill would be adjudged the winner. Not in a single instance this year has a first-class certificate been withheld through a machine failing to climb any of the test hills at any set speed.

F. STRAIGHT,

Secretary Auto Cycle Union.

The "Banned" Liverpool A.C.C. Trial.

[5958.]—With reference to the notice in your issue of the 28th ult., the decision of the A.C.U. in the matter of the above trial is decidedly unfair. Why was it "banned"? The next quarterly trials will not be held until a week later, and upon entirely different ground, so that the trial does not clash with A.C.U. events.

In the interests of motor cyclists generally, I think that the A.C.U. action is very unsportsmanlike, and in the true interests of the sport in the North the time has now arrived for the northern clubs to throw off the yoke of the A.C.U., and prompt action should now be taken by all the northern clubs to support the Northern League and organise our own competitions.

A meeting should be held as soon as possible, say at Manchester or Liverpool, and each club send one or two representative members with full voting powers to the said meeting and thoroughly thresh out the pros and cons of this very vexatious question. Now then, "Northerners," wake up!!!

E. W. KURKOPP,

Captain Oxton (Birkenhead) M.C.C.

[If the A.C.U. is to govern the pastime and retain its position in the world of sport, it cannot permit clubs to hold what are practically open events by driving a coach and horses through its regulations. We hold no brief for either side, but can hardly agree with the Liverpool method of enrolling members for this event only.—Ed.]

Novel Method of Repairing a Broken Petrol Pipe.

[5959.]—When out walking the other night I met two motor cyclists who were stranded by a broken petrol pipe, and nothing and no one near to mend it. I happened to be sucking a Russian toffee tablet and casually offered to stick this round it. It was most effectual, and they went on their way rejoicing, so it is perhaps as well to have a few Russian tablets in one's pocket. Wishing *The Motor Cycle*, from which I have had much useful information, continued success,

D. W. TEVIOTDALE.

Sidecar Steering.

[5960.]—I have noticed trouble with the steering of my sidecar, and found it to be caused by about 1in. to 1 1/2in. play in the attachment on the back stay, that is to say the sidecar could move away from and return to its proper track. The swerving was more pronounced when the front bicycle tyre was on the soft side.

I thought the attachment was quite tight, as I could not move it myself, but travelling on the road at any pace over fifteen miles per hour would pull on the cross tie (the one to the saddle pin), and this levered on the other connection.

Your readers may like to know this.

J. W. NAYLER.

Single-cylinder Records.

[5961.]—May I, through the medium of your widely circulated journal, ask when the hair-raising single-cylinder Indian is going to emulate the twin of that ilk?

I have been away, but on returning to London and seeing the 500 c.c. hour record broken again, I was prompted to write. I am only a humble private rider, and know but little of racing, but on quietly watching Brooklands both on off days and at public meetings, it has struck me that private record attempts must cost a lot of money, and surely, whether successful or not, cannot prove so valuable as having a bold whack at record at a public race meeting.

I must apologise for troubling you at such length, but in July I quite excited myself at the prospect of seeing the single-cylinder Indian projectile pulverising records, as in my mild way I always take an interest in a fast single, and I am impatient, or curious, to hear more of it.

What directly brought the matter back to my mind was a letter from a foreign friend of mine, who asked me what English records the Indian holds at present; but my knowledge of racing matters is not sufficiently extensive to enlighten him. Can you inform me?

ARTHUR M. C. SCOTT.

A STORM APRON noticed on W. Pratt's two-speed P and M. and Montgomery sidecar, which should especially appeal to winter tourists. Inset the upper part of the apron folded down. When not wanted the top half can be folded under and out of the way, or even used as a cover should the sidecar be left in the rain.

Lamps and Winter Riding.

[5962.]-Having read your leaderette on the above, we would like to point out that we should be only too glad of a trial such as you suggest. We heartily endorse your statement that reliability in the generator is of more importance than the volume of light given by the lamp. As manufacturers of electric lamps we have found the life of a standard 4 c.p. four volt Osram bulb to run into many thousands of miles, the breakage even then being usually the result of pure carelessness on the part of the user. We trust that a trial of some sort may be arranged, in which we should be only too eager to compete.

THE BOWEN AND ODERY MANUFACTURING CO.
R. W. ODERY.

[5963.]-I note in your issue of September 28th that "Ixion" has something uncomplimentary to say about modern lamp outfits, which I should like to confirm. My 1911 outfit consists of a well advertised head lamp and patent generator, each of which cost me 25s. I have nothing to say against the lamp itself, which when fully supplied with gas, gives an excellent beam, enabling me to travel safely at 30 or 35 m.p.h. along clear roads. But the generator, supplied by the same makers, is absolutely the most unsatisfactory article that could be designed for practical night riding. It is the most modern type. When the generator is absolutely clean it will supply gas well for, say, half an hour, but then the trouble begins and the light fails. The drops of water come into the carbide chamber through a perforated central tube, the perforations of which get clogged up with a stiff paste of moist lime gathering all round the central tube, and gas is only generated so long as the lump carbide is violently agitated in contact with this paste. A goodly portion of the water trickles through the mass of paste directly to the bottom compartment without touching the lump carbide on the grid. On coming to a village or a stretch of road which requires careful driving, down goes the light to zero, and it can only be resuscitated by making the engine race by continually slipping the clutch, or by tapping the generator vigorously to make the carbide rattle about. Correspondence with the makers only elicited the suggestion that too much water was passing; the trouble is really occasioned by a starvation of water in the right place. The other night the last twenty miles of my ride took over two hours, with constant stoppages to prod the contents of the generator. Finally, I had to dismount the whole thing, put the carbide in the bottom chamber, and use the generator after the old-fashioned method of the cheap German pattern to which "Ixion" refers. It seems to me that the grid principle is quite a wrong departure, unless means are provided for distributing the moisture all over the carbide on the top of the grid.

J. F. BRIGGS.

The Cause of some Tyre Troubles.

[5964.]-I think some of your correspondents must either have very bad luck with their tyres, or not take sufficient care in driving. I am almost a novice, and my experience is as follows: In the middle of August I bought a Bradbury 3½ h.p. and sidecar. From that time I have ridden 2,100 miles; at least 1,400 of them having the sidecar attached. About 250 miles were ridden over very rough bye-roads in Norfolk, and the only expense I have been put to, apart from the cost of running, has been a new exhaust valve, and in addition I have had one puncture in the back wheel.

My tyres are still in good condition, and bear very little appearance of giving way just at present. On the 1st I went from Nottingham to Northampton and back, and on the return journey, although I was travelling twenty-nine miles an hour, another motor cyclist simply shot by me with a passenger on his carrier.

From what I can see many motor cyclists ride their machines to death. I have got more enjoyment out of reasonable running than, I believe, many others get from mere speed, and I think the latter may account for some of the tyre troubles your correspondents complain of.

F. J. FLANAGAN.

Will Hill-climbs Survive?

[5965.]-I think I am right in considering that the remarks of "Observant" re Coventry and Warwickshire hill-climb are intended to apply to myself.

"Observant" complains that my machine was taken to the hill on a car, and also hints that the compression of the engine was so high that it could not have been conveniently ridden over. In other words, he suggests that mine was a freak machine made for the job, and that it was useless for an ordinary amateur to compete against it.

I think I can claim to have ridden in nearly all the most important hill-climbs held during the year, yet the Newnham climb is the only occasion on which I have not ridden my machine to the start. The facts are these:

At 10.50 the morning of the climb I got delivery of my machine from the makers. All competitors had to weigh in at Newnham before 12 noon. A journey of over forty miles to do on a brand new machine in one and a half hours, and no lamps for the return run.

Was it to be wondered that I accepted the offer of a lift by a friend who was going to see the competition?

It is easier and safer for a 40 h.p. car to average thirty miles per hour than for a motor cycle.

Now for the capabilities of a high-compression engine:

The engines I use both for hill-climbs and reliability trials are the standard competition 3½ h.p.

I used an exactly similar engine in the London-Edinburgh-London run, M.C.C. Winter Trials. Quarterly Trials, etc. It is an engine that driven in a commonsense manner is in every way suitable for touring.

If "Observant" is at all inclined to doubt this I shall be only too pleased to arrange a little non-stop reliability test over any distance and any road he may select. I will ride the same machine with which I compete in open hill-climbs, and he any 3½ h.p. single-gear machine he likes.

I think we should then be able to see if the 3½ h.p. Precision competition engines are "incapable of keeping their best tune in a run of forty miles" or not.

JACK WOODHOUSE.

Sidecars and Change-speed Gears.

[5966.]-I have read with much interest the correspondence on the suitability of the 3½ h.p. single-cylinder for sidecar work. My own experience is that a 5-6 h.p. two-speed twin is absolutely the lowest powered machine with which it is possible to do any enjoyable sidecar touring.

In letter 5913 Mr. Hugh Gibson gives it as his opinion that the 3½ h.p. single-cylinder and sidecar can do anything that the 5-6 h.p. outfit is capable of. Would he have us believe that the extra 2 h.p. is useless, and that the extra cost of upkeep is so much money absolutely thrown away? My sidecar touring has proved just the contrary.

With regard to the reliability of the 3½ h.p. single-cylinder engine over the twin when used for sidecar work, I mention that the single is more likely to give trouble owing to its lower gear ratio, and consequently greater engine speed, than the twin engine running at a normal speed on its higher gear. The weakest part of the modern sidecar outfit (with very few exceptions), it seems to me, is the frame of the motor cycle, and I hope that designers will pay attention to this most important point in next year's models.

T. M. JONES.

The private road in Luton Hoo Park which the Herts. County A.C. will use for the speed trials on the 21st inst., by kind permission of Sir Julius Wernher.

A.C.U. Quarterly Trial.

[5967.]-May I urge a word of warning to competitors passing through the narrow winding streets of Bewdley. At the worst point five roads meet, and just here is a favourite place for farmers to leave their carts and for children to run about. It is a death trap at any speed over six or seven miles an hour. A.B.

Cold Vulcanising.

[5968.]-I have had three tyres retreaded all similar in every way by a leading manufacturer. One done about a year ago has stood 1,000 miles on the back wheel, and a greater distance on the front, and though now smooth is still sound in every way. The second began to come off (i.e., the new tread) in 100 miles, and was badly off all round in 500. The third in 400 miles was worn clean through down to the original tread, and completely separated from it except close to the rim on each side. In both these cases, though the failure was different, the tread had come away from the foundation, and was in no sense amalgamated to it as when properly vulcanised. The makers say that motor cycle tyres cannot be hot vulcanised again, and that they have a special cold process. I should be glad to know if this is a fact, and what cold vulcanising means, and if it is another name for solutioning! The tyres were all 26in. by 2in. wired, and non-skid retreads were fitted; machine, 2½ h.p. F.N. RETREAD.

Silence.

[5969.]-I am very pleased at the fact that you are still persevering in your crusade on behalf of the silent motor bicycle. There is no reason why any motor cycle or car should make an objectionable noise. I do not at all agree with E. W. Knight's letter, in last week's issue of *The Motor Cycle*, re his old machine. For a few shillings he can buy a good and silent silencer, which will stop all the noise made by his exhaust. Anyone who can afford to ride a motor cycle can surely afford the few shillings necessary to purchase a new silencer. The noise made by the old motor cycles is bad enough, but these new and more powerful machines are fitted with such poor silencers that it appears necessary to fit a cut-out to them (this does not say much for the silencer), and these cut-outs are used by a certain class of rider with an entire disregard to the comfort of other people.

There is a certain class of motor lunatic about known as the "speed merchant," who imagines the road is made for his especial benefit. The animal is easily spotted: it runs on two wheels, has a humpy back, a pair of huge goggles, a cap turned the wrong way, and an engine the explosions of which shake the surrounding houses. This animal, whose other name is the "road hog," rushes furiously about the roads like a mad dog, seeing nothing but the road immediately in front of its nose; its behaviour is so gross that it has brought discredit on the decent road rider. When this animal is seen it should be caught and caged, and then the rational user of the roads would have a chance again of using them in safety, and, in addition, he could get some sleep at night. The road hog is looked upon by the man in the street as a bit of dirt, that is, matter in the wrong place.

I see "Ixion" says in his notes, "Up the phenomenal precipice, miles from human habitation. You would naturally drive

on a free exhaust." Why, might I ask? If the silencer is properly constructed there will be no back pressure, and consequently no cut-out will be necessary. Let "Ixion" try a two or three-speed gear and seal up his cut-out. M.D.

New Brighton Track.

[5970.]-I notice a few remarks by a Mr. Newmann re the above subject. May I remind him that records are usually officially timed, otherwise they are not considered. Mr. Newmann says nothing about his timekeepers. Was it by speedometer? Again the statements made are ambiguous. He says, "I attained a speed of sixty miles per hour, and the same morning I equalled his mile record for the track." Now does this mean that a mile was covered in sixty seconds, or merely that he touched sixty on the straights? The first I consider practically impossible, and the second has been done many times, and has to be, by anyone who approaches the mile figures, as the speed naturally drops on the banking. The speed I have attained, officially timed, was two laps at twenty-one seconds to the lap, and at this speed my back wheel would not hold the banking, the angle being too great. Now my 7 h.p. Rex has as short a wheel-base as any machine on the market, and were it not for special tyres with the tread specially vulcanised on the left wall, I do not consider I could hold it on the banking at a higher speed. By the way, one day in practising I was reputed (I say advisedly, repented) to cover one lap in nineteen seconds, but I do not believe it possible, although timed by an amateur with a stop watch.

I should be pleased to meet Mr. Newmann on this track, as he suggests, when next he is in this district.

Liverpool.

E. F. BAXTER.

The A.C.U. and the Liverpool A.C.C.

[5971.]-The recent action of the A.C.U. in refusing permission to the Liverpool A.C. Club to hold an open reliability trial in its own district calls for a little candid comment.

I understand that the A.C.U., in refusing to grant a permit, stated that it did not consider that such a trial was in any way called for, and moreover, the "trade" did not want it.

Traversing its objections, if the event was, as it had claimed, "uncalled for," no one would enter, even if the A.C.U. had graciously granted its august permit and patronage, and the only result would be to deplete the club funds by the amount of the permit fee paid to the A.C.U. Again, if the trade did "not want it," the trade would be at perfect liberty to stay away. These events are got up by clubs for the sport and pleasure they provide for those who care to compete, and not for trade purposes.

Certainly, the trade rider is welcome to come in, if he so chooses, but there is no compulsion in the matter. But if he does not care to do so, that is no reason why the sporting amateur should be prevented from competing in an event proposed to be run under A.C.U. rules and ordinary road traffic regulations. Imagine the National Cyclists' Union refusing a permit to a club of standing for an open race meeting on the grounds that such meeting was "uncalled for" and that the cycle trade "did not want it"!

J. F. MACNAB.

Brookdale M.C.C. hill-climb at Westerham on Saturday last. A group of competitors.

The Liverpool Club's Two Days' Reliability Trial.

AN EVENT "BANNED" BY THE A.C.U.

THE Liverpool A.C.C. two days' reliability trial was held last weekend, Ledsham (Cheshire) being the starting point, and a fair crowd assembled at noon to see the competitors leave. The riding conditions on Saturday were ideal. It will be recollected that it was intended that this event should be "open," but the A.C.U. refused to grant a permit, and subsequently threatened to suspend all motor cyclists who were non-members who took part. Saturday's route was as follows: Ledsham (start), Queensferry (5½ miles), Mold (7), Ruthin (9½), Cerrig-y-Druoidion (13½), Pentre Voelas (6), Denbigh (14½), Bodfari (3), Caerwys (3), Cilcain (3), Mold (4), Queensferry (7), Ledsham (5½). Petrol at Denbigh control, fifteen minutes compulsory stop. Thirty-eight out of forty-four entrants started, including several well-known riders. W. Heaton (A.J.S.) used gears of 6½ and 13½ to 1, evidently expecting severe ascents. H. Gibson, G. Wray, and P. Platt were mounted on Bradburys, and the Baxters on Rex machines. The competitors were got away smartly in trios, and some were early in difficulties with punctures. This seemed to be the only trouble they had to contend with, as the first part of the course was a very easy journey for a modern motor bicycle. The long hill out of Mold caused no trouble. Hugh Gibson went up with his chain-driven Bradbury and sidecar on top gear. Later in the day he retired, owing to the keyway on the counter-shaft sprocket wheel shearing off. The much talked of hill, Cilcain (observed), proved anything but difficult, yet several failures were noticed. Pedals were used very freely, and more than one rider ran alongside, and then conked

Ledsham, Cheshire, the starting point. Competitors assembling for the start.

to a standstill. Cilcain village lies in a valley, and the corresponding hill leading out of this place is really very bad, so some exciting times were anticipated on the next day's run. The road for two or three miles leading to Cilcain, from the Denbigh side, is really atrocious, there being just enough room for a passenger combination, whilst the surface is beyond description. The last quarter of a mile drops 1 in 3½ into the village. On this stretch Platt (Bradbury) gashed his back cover so badly that he retired. From this point to the finish (16½ miles)

Mrs. Baxter (Rex) dropping down into Cilcain from the Denbigh side. This was the steepest hill in the trial, and had to be ascended on the second day's run. The gradient is 1 in 3½.

Cilcain Hill, the steep and twisty descent on the way to Denbigh. The competitor is Bel' (Chater-Lea sidecar).

the run was accomplished in daylight, when a final check was taken, the competitors then wending their way to Liverpool, to place the machines *en garage* for the morrow.

The Second Day's Run.

Some thirty competitors faced the starter at Birkenhead, and the first three went off for the 115½ miles journey at 10.15 a.m. The weather conditions overhead were again splendid, but the roads for a few miles were soaked with rain, which had fallen during the night. All

The Liverpool Club's Two Days' Trial.

got safely through to Rossett (twenty-two miles), where the first observed hill was encountered.

Sunday's route was as follows: Birkenhead Ferry (start), Chester 15½ miles, Rossett 6½, Cefn-y-bedd 3½, Llandegla 9, Mold 11½, Cilcain 4, Denbigh 13, Trefnant 2½, Tremeirchion 2½, St. Asaph 7, Ruddlan 2½, Newmarket 4½, Holywell 1½, Bagillt 2½, Northop 5, Mold 2½, Chester 8, and Birkenhead 15½.

Petrol at St. Asaph, 1½ hours compulsory stop.

Marks were given for silence, and this had a marked effect in excluding the open exhaust type of rider.

The Start from Birkenhead.

The competitors crossed the Mersey on Sunday morning by ferry boat, starting from Birkenhead at ten o'clock. All went well until Cilcain was reached, and here it was that most of the competitors met their Waterloo. A crowd of nearly three hundred assembled at the 1 in 3½ hill in the anticipation of witnessing some interesting performances, as Cilcain Hill was admittedly the *pièce de résistance* of the trial. A correspondent counted over one hundred motor cycles and cars gathered at the foot of the acclivity. The police were present, and, by stopping all non-competitors from practising, rendered great assistance to the officials in keeping the hill clear. This hill was descended by the competitors on the Saturday's run, which enabled them to gain some idea of the severity of the gradient at the bend, which is seen in our illustrations which appear on the previous page.

Three Riders Distinguish Themselves.

A number of competitors, especially those mounted on single-gear bicycles, skidded at the corner. Others failed through sheer inability to climb such a steep gradient. In the end only three riders were successful in making clean ascents of Cilcain, and it seems likely that the cup will go to one of them. These riders were Pollard (3½ h.p. Triumph), Gregson (3½ h.p. 85×88 mm. Bradbury, with C.A.P. carburetter), and W. Heaton (2½ h.p. two-speed A.J.S.). These three are deserving of great credit for their magnificent performances.

Mrs. Baxter unfortunately skidded, and, further, ran into a pig, but neither the rider nor the machine was much damaged. Her husband also skidded on Cilcain, but he recovered, and ran alongside his machine. The same fate befell George Wray, whose Bradbury had a plated cylinder, and was spotlessly clean at St. Asaph. He had been fancied for the Reliance Cup, offered as the chief award in the contest, so that his skid is all the more unfortunate.

It must be admitted that the sidecars made a very poor show, as only one succeeded in reaching the summit of the hill unaided, and this at the second attempt.

Lunch was well served at the Plough Hotel, St. Asaph. Hobbs (Triumph) retired with a broken piston, and Moggor was noticed repairing a puncture near Bagillt. At Chester lamps had to be lighted for the final stage of the journey.

The first to arrive at Hope Street Garage, Liverpool, was Wray, who checked in at about 7.30 p.m.

Great enthusiasm was displayed along the route, although some trouble was caused to competitors by urchins removing the direction arrows.

On the second day Hugh Gibson rode round the course as a marshal, with Platt seated on his carrier.

Despite the A.C.U. ban we are told that only some five or six entrants refrained from riding. The trial proved a great success in every sense. The course and conditions were arduous. The officials all worked with a will, and the judge, Mr. S. W. Carty, was indefatigable in the performance of his duties. He was mounted on a 6 h.p. twin N.S.U., and by cutting across country he was enabled to watch the competitors on most of the hills.

Newmarket Hill Unobserved.

Unfortunately, he was unable to reach the hill at Newmarket in time, and as this gradient practically accounted for the whole of the competitors, it is to be regretted no official account was obtained. It is rumoured that only W. Heaton, on the A.J.S., and a Rudge rider climbed Newmarket at the first attempt, and it is highly probable that the cup will now go to Heaton, as he also climbed Cilcain and made a non-stop run. The first prize for best performance on a single-gear machine will no doubt go to either T. Pollard (3½ h.p. Triumph), or A. Gregson (3½ h.p. Bradbury).

All machines were very minutely examined by the judge in Hope Street Garage, Liverpool, at the finish.

Mrs. Baxter pluckily completed the course, although she had suffered from several minor mishaps.

Next Year's Prospects.

A more ambitious trial is already being projected for early next year. Motor cyclists generally seem to look upon the action of the A.C.U. as an insult to the whole motor cycling community in the Liverpool district. An

indignation meeting is shortly to be called and a plan of action decided upon.

No accident was reported, and all the retirements were due to most unforeseen and very rare breakdowns.

Complete List of Survivors.

Of the 38 starters, 25 in all duly finished as follows:

MOTOR CYCLES.

F. C. Jones (3½ Bradbury).
Geo. Wray (3½ Bradbury).
L. V. Barton (3½ Mead-Precision).
W. W. Hague (3½ Triumph).
J. W. Baker (3½ Triumph).
D. Lloyd (3½ Triumph).
T. W. Pollard (3½ Triumph).
G. Gregson (3½ Bradbury).
H. C. Marston (3½ Rudge).
N. Brown (3½ Rudge).
H. Marston (8 Bat-Jap).
F. Markland (3½ Spa-Jap).
S. W. Phillpott (2 Humber).
E. F. Baxter (7 Rex).
Mrs. Baxter (3½ Rex).
M. G. Rolls (5.6 Bat-Jap).
M. Glasgow (3½ Triumph).
J. H. Fox (3½ Triumph).
J. J. Scott (3½ Triumph).
W. Heaton (2½ two-speed A.J.S.).
T. Carroll (3½ Bradbury).
A. Bell (3 N.S.U.).
E. W. Kirkcup (3½ Matchless).

PASSENGER MACHINES.

G. Anderson (7 Waverley and sidecar).
T. C. Smythe (6 Zenith and sidecar).
65.8% of the total number succeeded in finishing the trial.

The State of our Roads.

A correspondent named A. E. Ball wrote last week and pointed out that we might change our minds regarding the filling of pot-holes by stones and tar if we were to try a spin from Nottingham to Doncaster *via* Mansfield and Worksop. Our correspondent is doubtless absolutely correct with regard to this particular section of road, but in other parts of England this filling process is carried out in a surprisingly efficient manner.

The observed hill at Rossett. Mrs. Baxter has just passed another competitor.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Oct. 12th	...	6.12 p.m.
" 14th	...	6.8 "
" 16th	...	6.4 "
" 18th	...	6.0 "

A Difference.

C. R. Collier writes us to the effect that he still holds the five miles record for the Crystal Palace track, his time being 5m. 33s. Harry Martin's time of 5m. 58½s. was claimed as record, but this refers to a track record for engines of limited dimensions.

Proposed Club for Beckenham.

A movement is on foot to establish a motor cycle club at Beckenham and the district. Mr. D. Lavender, proprietor of the Albemarle Motor Cycle Exchange, Beckenham, has kindly granted the use of a suitable club room at the first named place.

Motor Cyclist Awarded £50 Damages.

Last week, at the Harleston County Court, S. W. Denny claimed damages from Mr. Epps, of Maidstone, for damage caused by the negligent driving of the defendant's servant. It appears that the defendant's motor car, in approaching the main road from a cross road, crashed into the plaintiff, and completely wrecked his bicycle, but fortunately did not seriously injure the rider, although he was incapacitated for some weeks from work. The Judge, in giving judgment, said the evidence was quite sufficient to show that the accident was entirely the fault of the driver of the car, against whom no charge of excessive speed had been made. He did not exercise care in coming off a by on to a main road. Damages awarded, £50 with costs.

Motor Cycle Activity in Italy.

On the 15th inst. an important motor cycle race will be held, starting from the gates of Turin, over the Orbassano-Bruino-Piossasco circuit, 100 kilometres in extent, for which the Grand Prix de l'Exposition will be contested. The contest will be divided into five classes, according to cylinder capacity, for engines not exceeding 250, 300, 333, 500, and over 500 c.c. Except as regards auxiliary exhaust ports no restrictions will be imposed. The Società Sportiva la Torino reserves for itself the right to cancel any class represented by only one make and to transfer this to another class. The Grand Prix de l'Exposition will be competed for between all classes and will be awarded on formula. The race is likely to be a great success, since all the firms who showed at the Turin Exhibition will take part. Very high speeds are expected.

Are Brazing Lamps Dangerous?

An action of considerable interest to motor cycle traders, and bearing particularly on the liability of makers of tools, was held in the Watford County Court on the 2nd inst. The makers of a petrol brazing lamp were mulcted in £100 damages, the decision of the jury being that the lamp was defective between the container and the vaporiser, and they considered, as reasonable business men, that the defendants ought to have known that it was dangerous.

We Hear

That Jake de Rosier has ordered a Matchless twin from H. Collier and Sons, Ltd.

That if someone can find a suitable spot to build a three-lap track, Indian Wells can find the cash.

That O. C. Godfrey's Indian is fitted with Jake de Rosier's racing cams. (Now we shall see if it is "in the engine.")

That the Devonshire riders at the Streatham and District open hill-climb gave the finest display of corner work seen in the South.

That the Zenith people were all smiles at the Streatham hill-climb.

That Harry Martin contemplates taking a trip across the Atlantic to capture some of the American records, or dollars.

That the Bowden people have 10,000 handle-bar controls for magneto on order for 1912.

That an attempt was made by burglars to force an entrance into the premises of the New Hudson Co. in Gray's Inn Road.

That Harry Bashall is suffering from water on the knee.

That Fred Barnes is going to give a champagne supper to all his friends after his recent run of successes.

That Father Tessier was as "keen" as the "keenest" down Brasted way.

That some private members of the A.C.U. have not yet received the handbook.

That James Merton is none other than Bert Goodswain, and that several of our leading manufacturers would like to meet him.

That "Billy" Cooper was conspicuous by his absence at the Southern hill-climb.

That another American firm—the Peerless—are about to invade England with their motor cycles, and are already looking out for suitable showrooms.

That Harold Karlake contemplates applying for the old age pension for his Dreadnought.

That one of our leading 3½ h.p. single-cylinder manufacturers is out for "70" before the show.

That O. C. Godfrey has made a bet that he gets the hour record before the show on the single-cylinder Indian.

SPECIAL FEATURES.

OVERSEAS NUMBER.

Experiences and opinions of motor cyclists in all parts of the world.

1912 MODELS.

THE QUARTERLY TRIALS. BROOKLANDS EVENTS.

An American Consular Report.

Motor cycle manufacturers will be interested in an American Consular report which says: "Mexico presents a fine field for the exportation of automobiles (presumably motor cycles are included). During 1910, 209 motor vehicles arrived at the Port Vera Cruz and were re-shipped to Mexico. Of these 151 were from Germany, 38 from the United States, 11 from France, 8 from England, and 1 from Spain.

A Speedy Arrest.

The other day the Witham police received a telephone message from Chelmsford stating that a man wanted by the Cambridge borough police for stealing a motor cycle would no doubt pass through the town on the stolen machine. Two constables at once started for the cross roads near Bridge Street, where after a few minutes' wait they saw a motor cyclist approaching. The man, whose name was given as Charles Vivian Sumpter, *alias* Claude Graham, was stopped by the officers, detained, and subsequently handed over to the Cambridge police.

Left the Plug Intact.

A Greenwich motor cyclist had a curious mishap with his single-cylinder machine of this year's make. He was starting up when with a loud report the cylinder head blew off in several pieces. He picked up the inlet valve cap thirty yards away, and the other with the plug intact was hanging on the terminal wire from the magneto. The force of the explosion buckled the under part of the tank. Fortunately, he had a spare cylinder at home and after fitting the same and repairing the tank was able to use the machine again the following day.

Scientific Matters in Germany.

A prize competition has been held in Germany under the auspices of the Prussian War Office, for treatises on various subjects connected with motor cycles, which are as follows: "Protection against the danger of "skidding," "Transmission, especially as regards reliability, silence, and simplicity," "Free engine and change speed gears," "Springing," "Protection against dirt and dust." None of the papers received proved good enough for a first prize, but there were several minor awards. The Prussian War Office purposes co-operating with the General German M.C. in organising a reliability run next year.

The Man and the Rim.

A. H. Sanderson, one of Australia's army of ten thousand motor cyclists, recently crashed into a closed railway gate at night. The gate was undamaged: not

The man and the rim.

so the front wheel rim, which under the strain assumed a peculiar deltoid shape. Being an amateur photographer, and desiring a memento of a fortunate escape, Mr. Sanderson faked a negative, with the results shown in the picture.

The Gaillon Hill-climb.

The results of this French hill-climb, which was held last week, are as follows: Quarter-litre class—1, Brunet (Griffon); third-litre class—1, Laudel (N.S.U.); under 50 kilos—1, Magnat-Debon (Pierrard), 1m. 24½s.; over 50 kilos—1, Peugeot (Guillon), 42½s.; tricars—1, Riviere (Mototri-Contal).

The fastest time of the day in the motor cycle class was accomplished on the Peugeot, 42½s.; the fastest car time being made on the 6-cylinder Rossel, 32½s.

Auto Cycle Union News.

At the last meeting of the A.C.U. Committee 229 touring members were elected and twelve full members, a total of 241.

AFFILIATION.—The following clubs have been affiliated to the parent body: Canterbury and District M.C.C. thirty members; Aberavon, Port Talbot and District M.C.C. thirty-three members; Furness M.C.C. thirty-seven members.

AN A.C.U. TOURING COMMITTEE.—The A.C.U. has appointed a special Touring Committee to deal with the appointment of hotels and repairers, which consists of Messrs. Otto Thomas, W. Cooper, A. J. Moorhouse, H. P. E. Harding, and C. C. Cooke.

OLYMPIA SHOW.—During the Olympia Motor Cycle Show, from November 20th to 25th, the A.C.U. will have Stand 172, while members will have their own club rooms, known as the Princes Rooms, thanks to the courtesy of the Motor Cycle Manufacturers' Union. The A.C.U. has sent a vote of thanks to the Union.

In place of Mr. Cove (who has resigned and gone to America) Mr. Moorhouse has been elected to the Competitions Committee, and Mr. Hart to the Legal Committee.

A.C.U. ANNUAL DINNER.—The A.C.U. annual dinner will be held on a Saturday in January. Ladies will be invited.

SIDECAR RECORDS ON THE TRACK.—The A.C.U. has decided to recognise sidecar records on the track, and it has been left to the Competitions Committee to define a sidecar accurately.

S. African Trade Increase.

All those who are interested in the motor cycle industry will be gratified by the phenomenal increase during the last twelve months in the imports of British motor cycles into South Africa. The extent of the advance are shown by the following figures:

1908.	1910	1911 to September.
£10,781	£23,005	£40,205

These show that for the first eight months of this year shipments from Great Britain are £17,200 more than for the whole of 1910.

M.C.C. Winter Run.

We understand that the winter run to Exeter and back will take place on Boxing Day and the following day, and it is quite likely that the schedule speed will be accelerated. A suggestion was made to carry the run on to Plymouth, but it should be remembered that if severe winter conditions prevail (the weather was rather favourable last time) an extended run is likely to be uncomfortable in bad weather. Last year there

FUTURE EVENTS

Oct. 13.—A.C.U. Council Meeting at the Imperial Hotel, Birmingham, at 7.30 p.m., to be followed by a Smoking Concert.

.. 14.—A.C.U. Quarterly Trial (Midland Centre).

.. 21.—Herts. County A.C. Autumn Open Speed Trials.

Nov. 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

was no fog and no snow, and a schedule of 15 m.p.h. was easily adhered to. This year if the schedule goes up to the 18 m.p.h., it will be, in our opinion, unwise to extend the course. A dozen entrants have already notified their intention of competing.

Ladies in the Quarterly Trials.

Mrs. C. C. Cooke is the first and only lady to accomplish a non-stop run in a quarterly trial, which she did at the end of last year, riding her 3½ h.p. Triumph. Miss Hough will attempt to equal Mrs. Cooke's feat in the Midland Quarterly Trial on Saturday, although it must be admitted that this year's quarterly trial courses have been much more severe than hitherto. Miss Hough's mount is a two-speed Douglas.

Racing at Toronto, Canada.

Canadian records were broken and re-broken at Toronto on the 16th ult., new times being put up for every distance from three to twenty-five miles. The feature of the afternoon was the twenty-five mile race for the J. W. Commeford trophy. At five miles Cole's time was 6m. 11s. which beats Canadian record by 23s. His ten miles time was 12m. 30s., fifteen miles were covered in 18m. 30½s., twenty miles in 24m. 45s., and the full distance of twenty-five miles in 30m. 56½s. The English machines were very successful. W. Stower, on a Triumph, won the Auto Tire Co.'s cup, while W. Banfield, also riding a Triumph, won the five miles race for belt-driven machines.

Snowdon an Almost Impossible Climb.

In search of "unclimbable" hills, H. G. Bell has been touring North Wales on a two-speed four-cylinder F.N. and sidecar, and seriously commenced arranging an ascent of Snowdon by the railway track. It was Mr. Letts and Mr. Bell who climbed Snowdon in 1905 on a 6 h.p. single-cylinder Oldsmobile car, the journey occupying 56m., the distance being approximately five miles. On inspection of Snowdon with a view to a sidecar ascent, it was found almost impracticable to drive either a motor bicycle or sidecar combination to the summit, that is without numerous stops. In places the ballast is inches below the sleepers, and running water crosses the line at intervals. Mr. Bell thinks that with many stops to lift a machine from one side of the track to the other, a motor cycle ascent might prove successful.

Liverpool A.C.C. Two Days' Reliability Trial. A general view looking down Cilcain Hill.

MOTOR CYCLE RACING AT PORTMARNOCK. (See page 1070.)

A general view of the beach with the martello tower in the distance.

C. J. Franklin (7 h.p. Indian), the winner, takes one of the turns close in.

BRITISH IMPORTS AND EXPORTS.

THE accompanying table and chart show the enormous increase of the exports of motor cycles and parts during the last three years. In the case of July and January the value of the exports in 1911 is more than four times as great as in 1909. The imports have also increased, but not to anything like the same extent. In 1909 the value of the imports exceeded that of the exports in April, May, June, and July. In March, 1910, the imports

SHOWING RAPID INCREASE OF EXPORTS.

also slightly exceeded the exports in value, but in 1911 the value of the exports was always vastly in excess, in January and August being over three times as much, and on the average more than double. This is a very satisfactory state of affairs from the British manufacturers' point of view. The complete totals for the year are:

Exports.—1909, £105,435; 1910, £161,130; 1911 (to end of August), £181,418.

Imports.—1909, £70,452; 1910, £99,248; 1911 (to end of August), £79,651.

	EXPORTS.		
	1909.	1910	1911.
	£	£	£
August ...	9,054	16,038	25,487
July ...	6,764	12,045	29,660
June ...	5,551	11,428	17,139
May ...	6,001	9,495	22,706
April ...	6,183	11,196	22,339
March ...	7,629	10,461	19,439
February ...	6,463	9,460	20,949
January ...	4,504	10,935	23,699

	IMPORTS.		
	1909.	1910	1911.
	£	£	£
August ...	5,541	10,411	7,472
July ...	8,377	8,712	10,238
June ...	7,364	11,004	10,117
May ...	8,263	8,497	11,163
April ...	6,374	11,020	12,106
March ...	5,965	10,885	12,342
February ...	4,581	6,348	9,107
January ...	3,213	7,564	7,106

Since completing the chart and table given, we have received the returns for September, which are as follows: Exports.—1909, £9,666; 1910, £15,543; 1911, £32,579 considerably the largest monthly total up to date).

Imports.—1909, £3,878; 1910, £7,297; 1911, £8,208 (about one-quarter of the value of the exports).

MOTOR CYCLE IMPORTS, MARCH TO AUGUST.

1912 MODELS.

Advance Details of New Pattern Motor Cycles.

Next year's free engine Rover, the alterations from this year's model being in detail only.

Components, Ltd.

For next year, Components, Ltd., will enlarge their engine to $86\frac{1}{2}$ bore \times 85 mm. stroke, as used in the T.T. Race. Other features will be an automatic sight-feed lubricator, and an improved form of their variable gear. The control of the decompressor has been redesigned.

Another Counter-shaft Gear.

Bowden Wire, Ltd., is the latest firm to devote attention to the two-speed question. A fortnight ago we encountered Mr. Alec Ross on a Bat machine, fitted with the Bowden two-speed bottom bracket gear, which he was testing. It will shortly be dealt with in these columns.

The M.M.

We illustrate below the new 7-9 h.p. twin M.M., the bore and stroke of which are 82×91.5 mm. The magneto is a

Bosch and the carburetter a Schebler. The attachment of the engine to the frame by the cylinder heads is interesting. The 4 h.p. single-cylinder model is of the same dimensions. It is illustrated on page 1082. The engine is attached to the frame at three points: at the cylinder head, to the lower of the two top rails, and fore and aft at the crank case. The carburetter and magneto control are carried out in the usual American manner by long rubber twist handles and rods. The back wheel is very easily detachable, and is provided with a chain adjuster which serves to adjust the tension of the belt. The bottom bracket is carried above the forward end of the chain stays, and is able to be rocked backwards and forwards, the amount of movement being controlled by means of an adjuster which enables the pedalling chain to be very easily tightened. The stand is sub-

stantial, and when the machine is taken off it automatically flies quickly up into position. The front wheel is suspended on a flat laminated spring fork. It is interesting to note that the engine-shaft revolves on roller bearings. The tank is of brass, and provided with spun steel ends.

Both models will be fitted with a free engine clutch, which is of quite a simple nature, consisting, as it does, merely of an expanding brake which takes up the drive quite sweetly, so we are informed. It is worked by a long lever adjacent to the top tube.

The New Rover.

Rover motor cycles for 1912 will be improved in detail only, the general design remaining the same. The engine

The method of fixing the pedal spindle on the new Rover.

The wearing surface of the cam gear has been increased as much as fifty per cent., and the adjustable tappets are now held up to the valve stems by enclosed springs. Neater clutch leverage is

Combined lamp and generator bracket which is a standard fitting on next year's Rover.

employed, the pedal having a direct pull on the operating bell crank lever. Ignition is by the new type Bosch magneto driven by a wide silent chain and controlled from the left handle-bar, while the cut-out is now operated by a pedal. The spring fork is more compact, and is fitted with stronger springs than formerly. The tank has an extra sup-

New method of actuating the clutch on the 1912 Rover. It will be observed that the rod is inside the chain stay, enabling a direct pull on the bell crank lever.

A new model twin from the States—the 7-9 h.p. M.M. Note the special engine fixing.

1912 Models.—

porting clip, both fillers are fitted with strainers, and the oil pump has larger valves. Neater front and rear wheels stands are employed and the former is kept in place by an improved clip. Both brakes have been improved, the rear brake being fitted below the chain stay and operated by more substantial connections. The wheelbase has been shortened two inches. The alterations generally have made the machine considerably neater in appearance. Three models can be supplied. A fixed gear, and a free engine model, and another embodying the Armstrong three-speed gear. As will be noted from the illustration the firm have reverted to an L saddle pillar, and use a frame of the ordinary diamond pattern.

M.M. device for tightening the chain.

New Hudson Engine.

Mr. Roy Walker called at our offices last week with the experimental New Hudson $3\frac{1}{2}$ h.p. engine fitted to a three-speed motor bicycle and sidecar. We append a line sketch of this new power unit, which is on standard lines and does not present any novel features. The bore

The 1912 New Hudson engine and appurtenances.

and stroke are 85×88 mm. = 499 c.c., and a silent chain is used for the magneto drive; the cylinder is a particularly clean casting. The tappets are provided with springs to keep them in close contact with the valve stems. A short run with the new model, which had already covered several thousand miles, including 1,500 miles in Yorkshire, convinced us that the three-speed Armstrong sidecar gear and 1912 $3\frac{1}{2}$ h.p. New Hudson engine are a

Section of the B.S.A. free engine hub clutch for next year.

really excellent combination. A new belt caused a certain amount of slipping on the low gear, but the first time it ascended Stoneleigh Hill it took the combined weight of 25 stones with plenty of reserve power on the low gear, the top gear being 5 to 1. Mr. Walker told us that the machine had taken two passengers, combined weight 20 stones, up Sutton Bank, also Farlow Bank, which he claims to be a record for a $3\frac{1}{2}$ h.p. engine and sidecar.

B.S.A.

We publish a section of the free engine clutch which has been fitted to this year's B.S.A. machines, the same design having been decided upon for 1912. As will be seen, it consists of a double cone keyed to the belt rim, which is gripped between blocks with corresponding grooves on each side, and sliding in the hub shell. We have had an experience with one of the B.S.A. clutch machines, and found the clutch beautifully smooth in action.

The Racing B. and B.

Last week we described the new design B. and B. carburetter for 1912, illustrating its special features on page 1037. Our description applies to the lightweight and heavyweight standard models, but the firm have a racing pattern for those who wish to obtain racing results. This carburetter is similar to the universal type, but has a straight through air

opening with an extension pipe at the rear. To adjust this carburetter, the throttle and air orifices should be placed in the fully open position, the jet being set to suit. The makers say that this carburetter, which is put on the market

Arrangement of M.M. expanding engine pulley clutch

to oblige their racing clients, is not so controllable or as economical for ordinary touring purposes as the universal models with the adjustable primary and secondary air openings. The variable jet is standard on the racing model as well as the others already described. Readers will be interested to know that the firm

The new pattern 6 h.p. Rex Sidette, the engine of which, as will be seen, has side-by-side valves—a new departure for the Rex. Co. in connection with twin-cylinder engines.

1912 Models.—

has lately moved into well equipped works at the address mentioned, where every part will be made on high class automatic machinery, thereby ensuring accuracy and perfection of workmanship. We made a short tour of the works in company with Mr. C. Brown and his right-hand man, Mr. Evans, and found the works fitted up in the latest style. We mention the above as an instance of thoroughness and to prove to our readers that Messrs. Brown and Barlow intend to spare no expense or trouble to maintain their already high position in the motor cycle industry. A 1912 model was fitted to one of our machines in a few moments, and as we returned to the office by road we could detect an improvement in the running of the machine—a $3\frac{1}{2}$ h.p. and sidecar. It is an advantage with a low powered sidecar machine to be able to increase the petrol supply uphill.

New $3\frac{1}{2}$ h.p. Premier.

An important improvement has been made in the $3\frac{1}{2}$ h.p. model Premier for 1912, which still remains 85×88 mm. The whole cylinder has been re-designed, and outwardly has a neat pear-shaped appearance, while the cylinder head and valve ports have been somewhat modified in design, especially inwardly.

The frame has been considerably lowered, but the straight top tube is still retained. Detail improvements consist of a detachable rear mudguard, a belt rim guard, and an improved carrier with provision for pannier tool bags.

A New Quadrant Engine.

The Quadrant Co. have decided to add to their previous list of models an engine of 87×95 mm. for sidecar work. They will also manufacture a two-speed gear and free engine of their own. The gear will be placed in the rear hub, and will be of the epicyclic type.

Kynoch Redivivus.

Kynochs, Ltd., will place a $3\frac{1}{2}$ h.p. motor cycle on the market for 1912. It will be fitted with the J.A.P. 85.5×85 mm. engine, Druid forks, and the B.S.A. two-speed gear or free engine at option.

A Small Twin J.A.P.

We visited the works at Northumberland Park one day this week where the J.A.P. engines are made, and fortunately found Mr. J. A. Prestwich at home. A discussion on 1912 prospects elicited the information that the firm have one or two new designs in hand for the show. The 3 h.p. lightweight twin engine which has been used on a New Hudson in one or two 1911 events will be one of the 1912 standard models. It has V cylinders with bores and strokes of 60 by 76 mm., 425 c.c. side by side valves, and is a miniature model of its parent, the 8 h.p. Although called 3 h.p. it will give more and should be successfully applied to lightweight models where the even torque and smooth running of a twin are often preferred to the more powerful impulses of a 500 c.c. single.

Gear lever quadrant of the new two-speed James. The bracket holding the pulleys is placed at the angle of the frame tube close by the saddle, and not in the position shown in our sketch.

Gradior.

The 1912 Gradior engine, made by the Gradior Machine Co., Stafford, has an engine of $86\frac{1}{2} \times 90$ mm. and ball bearing crankshaft. It is designed for those who find a 500 c.c. engine hardly powerful enough, and should appeal to heavyweight riders and also sidecarists.

A new Gradior power unit for sidecar work. The engine dimensions are 86.5×90 mm.

A COUNTER-SHAFT VARIABLE BELT GEAR.

We have been favoured with a description of a counter-shaft variable belt gear, invented and made by Mr. L. Dugdale, 96, Dall Street, Burnley.

A is the pulley which runs on ball bearings on the stud E, carried by the actuating rod B. This rod can be fixed at its lower extremity to the bottom bracket or to a lug brazed on to the frame.

DD are the fixed flanges, and C the movable flange which is made to slide but not to turn upon A. The pulley is shown in its low gear position. It will be

noticed that as the lever B is moved backwards the change in belt tension will cause the flange C to move to the left, thus raising the gear, both from engine to counter-shaft and from counter-shaft to back wheel. No jockey pulley is needed, as the movement of the lever B does not affect belt tension. Mr. Dugdale says that he does not find the belts slip, and that the gear does all he

claims for it. He makes it to give six speeds, the lever B being held in six positions by slots in the quadrant F. It is obvious that quite a low gear is attainable with the usual engine pulley.

The 1912 model 2 h.p. Humber lady's machine, which is a standard mount for next year.

One Hundred Miles Race at Portmarnock.

THE open race meeting promoted by the Dublin and District Motor Cycle Club at Portmarnock on Saturday last proved a fitting wind-up to a very successful season. The novelty of the meeting was a hundred miles handicap, the longest race that has heretofore been held on the Velvet Strand being a fifty miles race. It attracted the entries of a couple of English riders, Stanhope Spencer, who beat the hour record at Brooklands last week, and another Rudge rider W. H. Elce. Although the former was on the course he did not feel sufficiently well to compete, and as a consequence the race lost a good deal of interest. Franklin gave a splendid exhibition of cornering at the turning points in both of the races on Saturday. In the two miles he won from scratch, covering the distance in 2m. 4s. from a standing start, and in the hundred miles race he just failed to get first place by ten seconds, the winner

turning up in T. Green, who on a $3\frac{1}{2}$ h.p. single-cylinder machine was in receipt of 25m. start. It was a very nice bit of weight allotting on which the handicapping committee deserve to be congratulated, for not only were the first and second men so close together, but the third and fourth were in their last lap when the winner finished. The prize in the hundred miles race was a silver cup presented by Rudge-Whitworth, Ltd. Details of the two events are appended:

TWO MILES HANDICAP.—C. B. Franklin (7 h.p. Indian), scratch, 1; J. J. Harvey (5 h.p. Bat), 18s., 2; P. Brady ($3\frac{1}{2}$ h.p. Rudge), 36s., 3.

HUNDRED MILES HANDICAP.—T. Green ($3\frac{1}{2}$ h.p. Blackrock Special), 25m. start, time 2h. 22m. 50s., 1; C. B. Franklin (7 h.p. Indian), scratch, 1h. 56m., 2; N. E. Drury (7 h.p. Indian), 3m. start, 2h. 2m. 33s., 3; J. J. Farrell ($3\frac{1}{2}$ h.p. Triumph), 33m. start, 2h. 35m. 26s., 4.

Next Saturday's Quarterly Trial.

The fourth and last of the series of 1911 Quarterly Trials is to take place in the Midland centre of the Auto Cycle Union on Saturday next, the 14th inst., starting from the Kemp Head Hotel, Hagley Road, about three miles out of Birmingham, at 9 a.m.

The course is about 150 miles in length, embracing Hagley, Kidderminster, Bewdley, Farlow Bank (test hill), Ludlow, Tenbury, Bromyard, Martley, Worcester (one hour stop for lunch), Tewkesbury, Gloucester, Birdlip (test hill), Cheltenham, Winchcombe, Evesham, Bromsgrove to Birmingham.

Entries are as under:

3,000 Miles Road Trial Completed.

D. R. O'Donovan, whose progress we have chronicled week by week since the commencement of his attempt to cover 3,000 miles without using a spanner on the engine, successfully completed his self-imposed task on Monday this week. At the end of that day's run he brought his total to 3,091 miles, but the exhaust valve had been showing signs of stretching for 300 miles. On the way from his home at Bedford to our Coventry offices on Tuesday the valve broke and the valve cap seals had consequently to be broken. The checkers on Monday, however, assert that all six seals affixed by *The Motor Cycle* were intact on that day. During the ride, Mr. O'Donovan has had no mechanical troubles of any kind, and the seals, etc., were intact at the finish. He rode about 160 miles a day, and on Sundays was accompanied by his wife, who also rides a $3\frac{1}{2}$ h.p. Singer clutch model. The back tyre—a $2\frac{1}{2}$ in. Michelin—easily lasted the 3,000 miles test and looks good for many more miles.

The rider has had one or two amusing experiences during the last week or two. One in particular he related to us and is worthy of publication. Naturally, everywhere he stopped he was asked all about the ride, what he was doing, how much he got for it, and whether he had trouble, etc., and while at Luton, checking at W. A. Sale's depot, an interested bystander of the artisan class asked to see his checking book, and when he found out that the authenticity of the ride depended on signatures, he suggested that he could be of some assistance for a consideration, as he had a brother at York, and he would sign the book in his brother's name, thereby proving an addition to the performance of about 187 miles. Needless to say, Mr. O'Donovan did not avail himself of this offer.

D. R. O'Donovan, who has just completed 3,000 miles on a $3\frac{1}{2}$ h.p. Singer without using a tool on the engine.

A SECOND SPIDER RUNABOUT.

Some Notes by the Designer and Maker.

MOTOR cyclists are slowly but surely accepting the small light runabout into their camp. Why? Because being constructed practically with cycle parts, having a motor cycle engine as power unit, and transmission to all intents and purposes identical, it is, in fact, a motor cycle on four wheels. And while with a similar engine it cannot beat a motor bicycle for speed, yet in the matter of cleanliness, accessibility of engine, transmission, and tyres,

it has undoubted advantages—not to mention absence of side-slip, a thing not to be lightly passed over.

My experiences—and they extend for seven years on the practical side of spider runabout building—lead me to the conclusion that a 500 c.c. single-cylinder engine with a variable gear is ample to propel a runabout weighing anything up to 3 cwt unladen, and I consider gears of 5, 8½, and 12 to 1 most suitable, or a little lower for hilly districts.

The essential features of a successful spider quad are—(1) lightness, (2) strength, and (3) perfection of design. The accompanying illustrations show what is meant.

Points of Design.

All engineers know that the greatest strength is attained by keeping the tubes straight. The first illustration, which shows the chassis alone, will clearly demonstrate that this has been done. Perhaps a few details will interest readers of *The Motor Cycle*. J.A.P. engine, 85×85 mm. bore and stroke, 482 c.c., J.A.P. carburettor, Bosch magneto. The engine drives the counter-shaft by means of a 3in. by 1½in. Renold chain through a two-speed rotating gear box on the principle of the back gear of a lathe, and 3in. Elswick belts transmit the power to the back wheels, which are shod with 26in. by 2¼in. Goodrich tyres. The long lever on the side of the chassis operates the belt rim brakes (the second photograph shows this very clearly). The small lever gives a free engine by holding the high speed clutch out of action. The engine is lubricated on the J.A.P. system. Weight without body 2 cwt. The body, which weighs 20 lbs., slips into the cradle-like chassis without any fastening whatever.

What it can do.

The following runs will illustrate its capabilities and prove that a 3½ h.p. engine is sufficient.

Eynsford, Sevenoaks, Tonbridge, Tunbridge Wells, Crowborough, School Hill, Lewes, and Hove. 52 miles 2¼ hours non-stop.

Hove, Handcross, Crawley, Reigate Hill, Sutton, Tooting, and Battersea Park. 50 miles. Two hours non-stop of engine.

The lowest gear was used only on the steepest hills and for starting from a standstill. I am, of course, aware that a 3½ h.p. motor bicycle could make better times than the above. But I prefer four wheels.

HAROLD E. DEW.

GOVERNMENT MOTOR CYCLES IN NYASSALAND.

This year, Messrs. Phelon and Moore, Ltd., have supplied to the Crown Agents for the Colonies, three machines for use by the Sleeping Sickness Commission in Nyassaland. The machines are fitted with a Montgomery sidecar with luggage board and hood. The P. and M. was chosen on account of its two speed gear and chain drive, and also, particularly the low compression engine. Sir David Bruce, the chief commissioner, was given instructions in driving the machine, and also as to its general management, before despatch abroad. Each one underwent a severe road test of 100 miles with the chief engineer in the sidecar. The test included the climbing of a certified gradient of 1 in 4½ with passenger, and a petrol consumption of 100 miles to the gallon. On the completion of this test, the makers were, we understand, complimented on the manner in which the machines had acquitted themselves.

THE SECOND SPIDER QUAD built to the design of H. E. Dew. This handy little runabout, the construction of which is rendered clear by the above illustrations, is described in detail on this page.

CLUB NEWS

Durham and District M.C.C.

The result of the all night ride held on September 23rd and 24th, under severe weather conditions, to Ferrybridge and back, is: F. C. Wake first, and R. W. Holmes second. Mr. Forster's attendance cup for club runs and competitions has been won by R. W. Rushworth, and Mr. Harrison's silver medal by W. P. Cross. The novices' competition will be held on October 15th, leaving Neville's Cross Hotel at 9 p.m. for Barnard Castle and Darlington.

Birmingham M.C.C.

A reliability trial will be held on October 28th in conjunction with the Sutton Coldfield A.C., for which the first prize is a silver cup, presented by Mr. P. J. Evans, winner of the Junior T.T. race. There are several other valuable prizes. The competition will take the form of a non-stop run *via* Stratford, Sunrising, Kineton, and Edge Hill. Particulars from Mr. Howard Smith, The Dingle, Four Oaks, or Mr. R. V. C. Brook, Oakdene, Cambridge Road, King's Heath. The "All Equal" hill-climb, in which all competitors had to ride the same two machines, proved to be a fiasco owing to the absolute inability of the machines to climb the hill.

Herts County A.C. (Motor Cycle Section).

The speed-judging competition, starting from the Red Lion, Hatfield, on October 7th, was held under wet conditions over a 23½ miles course at set speeds ranging upwards from 17 m.p.h. The result is appended:

	M. S.
1. E. C. Jarvis (¾ Triumph) ...	0 52½ fast
2. F. J. Beard (¾ Wanderer) ...	1 18 "
3. Mrs. C. C. Cooke (¾ Triumph) ...	3 51 slow

Bristol B. & M.C. (Motor Section) v. Bath C.C. (Motor Section).

An interesting match was run off on Saturday, the 7th inst., on a course of 43½ miles between Bath, Bristol, and Wells, including some severe hills. The teams were: Bristol—Clark, Fletcher, Wasley, Kickham, and Symes (2¾ h.p. Douglasses), Davies (¾ h.p. Rudge), and Bevan (5 h.p. Rex sidette); Bath—Powell, Wills, Provost, and Keevil (¾ h.p. Triumphs), Burden (Lincoln Elk), Bush (¾ h.p. Scott), and Kelly (¾ h.p. Scott and sidecar). The best climbing was done by Davies (¾ h.p. Rudge), and Kickham (2¾ h.p. Douglas). In the end the result lay between Kickham and Bush, all the rest having failed or missed the course. Kickham's error was 47s., while Bush was 64½s. out of his reckoning, so the Bristol club was declared to have won. The winners were entertained at dinner by the losers. The whole of the arrangements were in the hands of Mr. Philip Grout. Mr. A. E. Deacon acted as timekeeper.

North Middlesex M.C.C.

The petrol consumption tests were held on Saturday, September 30th, over a twelve miles course comprising several steep hills. The A.C.U. formula was used, and the following were the results:

	Figure of merit.
1. W. Noble (¾ Rover) ...	336.2
2. P. Dangerfield (¾ Zenith) ...	303.5
3. W. S. Bennett (¾ T. Norton) ...	302.9

A social run will take place on October 15th, meeting at the Gatehouse, Highgate, at 10.30 a.m.

Helensburgh M.C.C.

The members of the above club held their last hill-climb of the season at Garshake, Dumbarton, on the 30th ult. At the finish of the climb a speed-judging contest was run off over a stretch of road at the foot of the hill. Both contests were a decided success, and the principal results are as follows:

HILL-CLIMB.

Figure of merit.

H. W. Ballardie (T.T. Triumph) ...	522
R. McCulloch (T.T. Triumph) ...	514
T. Brash (T.T. Triumph) ...	493

SPEED-JUDGING.

E. Hunter (7 h.p. Indian) ...	1½s. error
P. Blair (¾ h.p. Triumph) ...	3s. "
G. W. Orr (¾ h.p. Ariel) ...	3½s. "

Coventry and Warwickshire M.C.

Last Saturday the closing run and speed-judging competition was held, four prizes being offered—two for cars and passenger motor cycles and two for motor bicycles. The hon. sec., Mr. Geoffrey Smith, acted as "hare," and laid a tortuous paper trail among the Warwickshire lanes from a 12 h.p. Humber car. The course, which measured twenty-three miles, included Styvechall, Baginton, Ryton, Birdingbury, Long Itchington, Stretton, Napton-on-the-Hill, and Southam, the finishing point being about a mile from the last mentioned place. The running was exceedingly close, as will be seen from the results announced by the president, Mr. J. V. Pugh, J.P., who presided over a company of thirty at the Bath Hotel, Leamington Spa, where tea was taken:

MOTOR BICYCLES.

1. S. Wright (¾ h.p. 1912 Humber) ...	30s. fast
2. B. S. Gorton (¾ h.p. Rex) ...	45s. slow
3. P. W. Johnson (¾ h.p. Triumph) ...	2m. 30s. slow
3. J. F. Spencer (¾ h.p. Triumph) ...	2m. 30s. slow

The prizes in the passenger section were won by 1, D. J. Corser (15 h.p. Rover car) with no error whatever; and 2, A. Wright (¾ h.p. Triumph and sidecar) 15s. fast.

Closing run and speed-judging competition of the Coventry and Warwickshire M.C. last Saturday. The "hare" car starting.

Club News.—

Leicester and District M.C.C.

The results in Lightweight Class sent last week contained an error. These should read: 1, G. W. Main (2 h.p. Humber); 2, W. H. Chapman (2½ h.p. A.J.S.).

Southampton M.C.

At the recent hill-climb of the Southampton and District Motor Club, held at Bishop's Waltham, the first place on formula was taken by S. J. Rodgers, on a 2 h.p. Humber lightweight, M. Tuffin, on a 5 h.p. Indian, being second, and S. W. Woolford, on a 2½ h.p. Minerva, third.

Mersey M.C.

A members' secret hill-climb was held at Llangollen on the 1st inst., the secret being so well kept that no one knew of the hill until a few minutes before starting time. The winner on time in the single-cylinder class was F. C. Jones (3½ Bradbury). The formula results are not yet worked out. A pair of tyres were presented by the Kempshall Tyre Co. as prizes.

Scarborough and District M.C.

Programme for October, 1911.—October 15th (Sunday), reliability trial, open to all members. The course will be kept secret until day of trial; distance 100 to 150 miles; start from Scarborough. October 18th (Wednesday), petrol consumption trial, open only to full members. Course, Whitby and back; start 2.30. Time allowed for journey, minimum two hours, maximum three hours. Pedalling chains removed on machines of 476 c.c. and over. October 21st (Saturday), petrol consumption trial continued for those who cannot compete on the 18th. October 25th (Wednesday), flexibility hill-climb, open only to full members. Venue, Hay Brow, near Scarborough; start 2.30. Winner to be the one who makes greatest difference between his fast and slow climbs.

Nottingham and District M.C.C.

A hundred mile circular course was selected for the Dennis-Bayley Challenge Cup in Derbyshire, which included some severe test hills. Nineteen competitors started, but only seven finished. The conditions were: Non-stop run, to be completed in five hours, petrol stop allowed. The following finished:

Error in schedule time.

1. F. P. Johnson (Humber) ...	5m. 16s.
2. Geo. Brough (Brough) ...	18m. 5s.
3. J. E. Poole (Rudge) ...	19m. 5s.
4. A. F. Cullen (Bat) ...	20m. 58s.
5. J. D. Mitchell (Triumph) ...	21m. 2s.
6. W. O. Soresby ...	21m. 39s.
7. A. W. Brittain ...	41m. 7s.

Naval M.C.

The Naval Motor Club held a very successful speed-judging competition on Saturday, 30th September. The meet was at the Hard, Portsmouth. Six competitors took part, and other members who were not competing joined in along the route, which was from the Hard to Petersfield, through Midhurst to Chichester. The competition area was to a point just outside Chichester. Any route was allowed to be taken so long as Petersfield and Midhurst were passed through, though the distance was officially thirty-seven miles. Each competitor drew a slip of paper upon which the speed he had to average was written. No one was allowed to tell anyone else what speed he had drawn. Speedometers and clocks on machines were covered over with paper. As a matter of fact, each competitor was given the same speed, viz., nineteen miles per hour. The result of the competition was as follows:

	m.p.h.
1. Lieut. D. I. McGillewie (3½ Rudge) ...	16.95
2. C. Ford (3½ Triumph) ...	16.91
3. Lieut. H. T. Bowen (3½ Triumph) ...	16.70
4. Sub-Lieut. J. H. Steel (3½ Humber) ...	15.94
5. Lieut. H. F. M. Peto (7 Indian) ...	14.98
6. Capt. Brown (10 Sizaire) ...	13.78

The finishing point was close to the barracks, Chichester, where the competitors were timed by Capt. Wyley and the hon. secretary. Tea was provided at the Dolphin Hotel, where a clock and case was presented to the winner, after which everyone started for home.

The Motor Cycling Club.

Mr. Southcomb May has been appointed hon. secretary to the Motor Cycling Club in place of Mr. A. Candler, who, to the great regret of the committee, has resigned. All communications should in future be addressed to Mr. Southcomb May, 15, Endsleigh Gardens.

The annual dinner will take place at the Café Monico on December 9th. New members joining now have the benefits of single subscription up to the end of next season.

Shropshire M.C.C.

A non-stop run to Aberystwyth was held on September 24th. The distance from Shrewsbury, through Newtown and Llanidloes, totalled seventy-five miles. Messrs. H. G. Potts and A. G. Benham carried out the timing arrangements, and the results were as follows: 1, J. F. Crellin (8 h.p. Dot-Jap), non-stop, error 3m.; 2, W. E. Trott (3½ Rudge), non-stop, 6½m.; 3, F. Hallows (3½ Rudge), one stop (oiled plug), 4½m.; A. T. Doody (3½ Premier and sidecar), ran out of petrol; W. Richards (3½ Humber), retired; J. Henshaw (3 h.p. Wolf), burst tyre. A run has been arranged for October 14th to Farlow Bank. Meet at Crown Hotel, Bridgnorth, at 9 a.m. prompt

Doncaster and District M.C.C.

Results of the hill-climb at Stainboro' Lowe on September 28th are as follows:

Class I. A and B. (300 c.c. and 345 c.c.)—1, J. A. Bassett (2 h.p. Humber), .073; 2, A. D. Robinson (2½ h.p. J.A.P.), .19; 3, W. Skiumore (2½ h.p. Douglas), .229. Four entries.

Class II. Standard Touring Singles (560 c.c.)—F. H. Dunstan (3½ h.p. Rudge) and E. Goult (3½ h.p. Triumph), tied .0935; D. Gill (3½ h.p. Calthorpe), .094. First three competitors will run again for first place at an early date. Eleven competitors.

Class III. Unlimited. For fastest time only.—1, J. Hemsworth (6 h.p. Zenith-Gradua), X; 2, T. Dunk (5 h.p. Rex), 1½s.; 3, A. T. Smith (6 h.p. Zenith-Gradua), 5s.

Herts County A. & A.C. (Motor Cycle Section).

Open speed trials will be held in Luton Hoo Park (by permission of Sir Julius Wernher) on Saturday, October 21st, at 1.30 p.m. The classes will be as follows:

Division A (open to any type of standard touring motor cycle).—Class I., single-cylinder motor cycles up to 300 c.c.; II., twin-cylinder motor cycles up to 343 c.c.; III., single-cylinder motor cycles up to 560 c.c.; IV., twin-cylinder motor cycles up to 750 c.c.; V., any machine; VI., any passenger machine.

Division B (for amateurs) and Division C (for racing machines) dimensions as above.

Miss N. Hough (2½ h.p. two-speed Douglas), who has entered for next Saturday's Quarterly Trial, and has already climbed Farlow Bank and Birdlip. The machine is geared 5 and 8 to 1.

WORLD'S SINGLE-CYLINDER RECORDS.

RUDGE SUCCESSES.

TUESDAY the 3rd inst. will be remembered for a long time to come in the annals of Rudge-Whitworth Ltd., owing to the number of successes gained by the firm on that day, and which we briefly referred to last week. It was fine and rather cold, windless at first but squally later. The first event was for Stanhope Spencer, W. H. Elce, and W. L. T. Rhys to try and beat the hour and two hour records. All three machines were practically identical externally. Mr. Ebbelwhite gave the word to go at 11.39 a.m. Spencer started first, while the other two followed at minute intervals. Elce soon retired through magneto trouble, but Rhys was travelling at between 62 and 63 miles an hour. Spencer, however, was going magnificently; he covered his second lap at 66.29 miles an hour, and managed to maintain this splendid speed. Rhys's average then fell

OFF! ON A MEMORABLE RIDE. W. Stanhope Spencer (3½ h.p. Rudge) being timed by A. V. Ebbelwhite. W. L. T. Rhys and W. H. Elce are on the starting line.

50 miles in 45m. 34½s. Previous best, J. R. Haswell, 47m. 24½s. (3½ Triumph), 26th August, 1911.

100 miles, 1h. 34m. 8s. Previous best, J. R. Haswell, 1h. 37m. 52½s. (3½ Triumph), 23rd September, 1911.

One hour, 65 miles 803 yards. Previous best, J. R. Haswell, 63 miles 194 yards (3½ Triumph), 26th August, 1911.

Two hours, 122 miles 210 yards. Previous best, G. Lee Evans, 108 miles 1,367 yards (4 Indian), 13th November, 1909.

Rhys rode consistently and well throughout the two hours, and in this period he covered 115 miles 336 yards.

Spencer's fastest lap was his sixth, which he covered at the rate of 66.65 m.p.h.

A One Hour Sidecar Record.

After lunch Pither set out to establish a sidecar record. The machine was a standard 3½ single-gear Rudge, with

mudguards removed, attached to a Portland sidecar fitted with apron and a wicker canoe-shaped body. The combined weight of the machine, sidecar, driver and passenger was 548 lbs. Pither kept up a consistent average of 42 m.p.h. until a plug blew out, reducing the average of that particular lap to 25 m.p.h., and in the hour he covered 40 miles 1,660 yards.

The final event of the day was Spencer's attempt to lower the five miles record held by the Rudge-Whitworth firm and to the credit of the late Victor Surridge. Spencer covered the distance in 4m. 33½s., beating the previous record by 2½s.

His machine was fitted with Dunlop tyres, Lyso belt, C.A.V. magneto, Brown and Parlow carburetter, was lubricated with Price's oil and fed by Pratt's spirit. The Rudge-Whitworth firm has every reason to be proud of these magnificent performances.

W. Stanhope Spencer, who first took to a motor bicycle last spring, when he bought a mount from the Rudge-Whitworth Bradford depot. He had not seen Brooklands until after the T.T. race. His age is 21.

to 60 and then to 59.30, but his running improved later on. At the end of thirteen laps Spencer was 1m. 12s. inside record, and after eighteen laps he was holder of the fifty mile record. At the end of the hour Rhys picked up to a 63 m.p.h. average, and Spencer had gained both the coveted hour and the fifty miles.

Towards the end of the hour a gusty wind sprang up, which pulled down Spencer's speed considerably. His speed at half time had been 66.47 m.p.h., and if it had not been for the wind he would have covered over 66 miles in the hour. During the second hour Spencer reduced speed to 64 m.p.h., and at the forty-third lap, with only eight minutes to go, he stopped with a broken inlet cotter. This, however, jammed so that the spring did not come adrift, and allowed him to finish. The following are Spencer's records:

F. E. Pither establishing his hour record of 40 miles 1,660 yds. on a 3½ h.p. Rudge and sidecar.

Wheels.—Front rim with inverted lever, rear brake on belt drum, foot operated.
Saddle.—Lycett's La Grande, three spiral springs.
Mudguards.—Extra wide steel, with piece extending well over front wheel.

SINGER TOURIST MODEL 3 1/2 h.p.

Specification :

Engine.—Single cylinder, 3 1/2 h.p., with cage type double ball bearings to main shaft, bore 85 mm., stroke 88 mm., capacity 499 c.c., M.O. valves, interchangeable; efficient silencer fitted, with pedal-operated repeating cut-out.
Ignition.—Bosch or Simms' high tension magneto, gear driven, bolted to table cast on crank case, operated by lever fixed to frame.
Carburettor.—Brown and Barlow, fitted with "Singer" patent ratchet handle-bar control.

Frame.—Specially designed, top rail curved downwards to afford low position.
Forks.—"Singer" registered design, spring girder pattern.

Foot Rests.—Aluminium plates, rubber studded, adjustable to any angle.

Tank.—Extra strong, fitted to bottom rail by means of brazed lugs; petrol gauge, concealed oil pump.
Capacity.—Petrol 1 1/4 gallons, oil 1 quart.

Handle-bar.—As illustrated, and affording the most comfortable position.

Wheels.—Front rim, with inverted lever; rear brake on belt drum, operated by left foot.

Spokes.—26 in., with heavy gauge spokes, extra strong rims, beaded edge.

Tyres.—Dunlop, rubber studded, non-skid, 26 in. x 2 1/4 in.; Palmer to order, at extra.

Carrier.—Variable pulley, highest 4 1/2 to 1, lowest 6 1/4 to 1.

Foot.—7 in. Lycett rubber.

SINGER LIGHTWEIGHT 2 1/2 h.p.

Specification :

Engine.—Single cylinder bore 69 mm., stroke 80 mm., c.c. 299, m.o. valves, efficient silencer fitted.

Ignition.—Bosch high tension magneto, gear driven.

Carburettor.—Brown & Barlow, fitted with Singer patent ratchet handle-bar control.
Frame.—New design, very low and convenient.

Forks.—Patent spring, girder pattern.

Wheels.—26" beaded edge.

Tyres.—Dunlop studded Motor Cycle, 25 x 2".

Tank.—Extra strong, fitted with petrol gauge and oil pump.

Belt.—3/4" Lycett rubber.

Carrier.—Tubular, large and serviceable.

Foot Rests.—Rubber, adjustable to angle.

Finish.—Best quality black enamel, bright parts plated on copper, rim centre enamelled; tank aluminium, panelled green.

Gear.—Variable pulley, high 5-1, low 7-1.

This Model can be supplied with Free Engine

Saddle.—Middlemore and Lamplugh 920B, padded top, Lycett, or Brooks' B105.

Mudguards.—Extra wide, front with side shields and extending well over wheel; "Singer" patent rear guard, readily detachable to facilitate tyre repairs.

Stand.—Very strong, kick-operated type.

Carrier.—Strong tubular, attached to a special lug bolted to mudguard bridge, quickly removable with mudguard.

Toolbags.—Substantial and serviceable, with roll and complete set of tools, secured to side of carrier by strong clips.

Finish.—Best quality black enamel, bright parts plated on copper, rim centres enamelled and lined; tank aluminium, panelled in green.

Priority

The Singer Detachable Rear Mudguard on Carrier. A most useful device for repairing Tyre Punctures

Bosch Magneto

There is
no
difficulty
in fitting a
GLORIA
Sidecar.

A special patented attachment is employed whereby all strains and stresses are widely distributed, and the car can be attached and detached at a moment's notice.

The wheel is provided with a Patented Spring Suspension, quite insulating the passenger from road shocks, and the car has a perfectly free trailing movement ; none of that binding and drag common to badly designed sidecars.

Let us send you full particulars and prices.

GLORIA CYCLE CO., LTD., COVENTRY.

In answering these advertisements it is desirable to mention "The Motor Cycle."

WHAT AUSTRALIA WANTS.

I WILL endeavour to keep entirely away from what some would probably say was the writer's ideal machine, and to give an accurate account of what the majority of riders would look for in vain when purchasing a mount.

My object is to awaken the English manufacturer to colonial requirements. Several firms have informed me that the home trade meets their output, and in some cases exceeds it, hence at present they find it unnecessary to consider export trade. This evidently accounts for the fact that in Australia to-day there are few of the prominent English makes that can be purchased without a dreary wait of many months.

Surely there is some solution of this "can't deliver" trouble? I do assert that the present Australian market is indeed large. The industry here is entirely in its infancy, it wants to stretch its legs, but is hobbled by this "can't deliver" question. Here is an opportunity for a manufacturer with some keenness who will adapt his wares to colonial conditions.

I might mention a commission I have in hand from an Australian firm to obtain English agencies. They impress very forcibly upon me that first consideration will be deliveries. When this matter of deliveries has been mastered, then will colonial requirements receive serious consideration from the English manufacturer. I say English, for it is only here that deliveries cannot be obtained. American and Continental people can deliver, and do deliver, in large quantities, but the demand in the English production has increased enormously. Surely this colonial proposition is worthy of weighty consideration.

Colonial Models.

The present popular type machine, on the whole, has certainly met with success. I do not contend that the manufacturer would have to market a machine that would only suit colonial requirements. The alterations I am about to suggest, I think, will find favour with many motor cyclists in the homeland. I shall not say much on engine matters, for the present power unit is all that is required, but the magneto should be behind the engine.

Road clearance is of vital importance. I have seen engines of four prominent types, all English, that had seriously suffered through contact with road obstacles. Spring forks of several designs lower the clearance when in action, but at no time should this be less than five inches. Lubrication is not at all satisfactory, and needs to be automatic.

Carburetters and their Control.

Carburetters need some dust-excluding arrangement to the air intakes. I have just read of Mr. Hardy's filter, and before long I hope to give one a test on Australian roads, where in places you plough through dust two or three inches deep, mile after mile.

While on the subject of carburetters, I am reminded of control wires. They are a continual source of trouble. Some manufacturers do not seem to give these the consideration they deserve. It appears to be a simple matter to attach the levers neatly and securely, yet make them easily detachable. The fastenings generally employed are more or less temporary arrangements, and only serve their purpose while the machine is in the showroom.

Outside levers and cables for controls should have the preference, though admittedly not as neat, but the advantage is that, should a wire give way, you are in a position to make a repair, whereas with internal wires it means a new length, which is difficult to purchase in the country districts, and if you are fortunate enough to have a spare it is not a roadside job to fit it.

Spring Forks

must still be much improved before they meet colonial requirements. The Druid is very popular. Makers are evidently not aware of the vile condition of Australian roads. It is beyond me to describe them, but I know they account for many failures where motors are concerned. They seem to have a particular weakness for rims, more especially the plated rims usually found on motor cycles of English manufacture. I have yet to see one of these rims that had done a season on Australian roads and was not in a bad condition. Thicker gauge spokes would be a welcome improvement.

Transmission

does not give as much trouble in Australia as it appears to in England. Perhaps the more favourable weather conditions account for this. I have started on a tour of some eight hundred miles with a $\frac{3}{4}$ in. plain Continental belt fitted to a 6 h.p. J.A.P. that had previously done six months' service, without a spare to fall back on, yet have not experienced the least trouble. This particular tour was through country where belts could not be purchased. This brand of belting is eminently suited to Australian climate. When first imported it is exceedingly hard and harsh, but a few days in the warm climate and it is quite flexible. Chain drive we are anxiously waiting for, and I think shall have ere long. It will require to be entirely enclosed, accessible, and easy to adjust. When this is the rule, chain drive will be welcomed.

Tanks and Fittings.

Tanks soon develop a tendency to shed their contents *via* the various joints. As their capacity is limited, and the supply at times difficult to obtain, makers would do well to increase the capacity to one and three-quarter gallons at least, and in some way reinforce the joints.

Fittings, such as lamp and generator brackets, should be part and parcel of the machine, preferably in conjunction with the handle-bars, where they are somewhat insulated from road shocks. Not till the manufacturer equips the machine with the necessary fittings can satisfaction be expected in this quarter. Horns, etc., should be included in the equipment of all machines.

That some rear shock absorbing arrangement is required is hardly necessary for me to mention—something that does not depart very much from the standard frame, neat in appearance, and effective in action. I am aware of several firms who do fit a very satisfactory rear-springing arrangement to their machines, but more important colonial requirements are missing. Immediate success awaits the maker whose machine embodies all these points, for such is what Australia wants.

S.L.B.

The Last Brooklands Meeting of the Year.

THE MOTOR CYCLE RACE.

THE last meeting of the season was held on Wednesday of last week in cool, damp, and dull weather. The one motor cycle race was run off early in the afternoon, fortunately while the weather was fine. The event was down on the programme as the Fourth Long Motor Cycle Handicap, distance about $8\frac{1}{2}$ miles (fork start). The machines had to pass the fork twice and then enter the straight. The entrant of the winner to receive 10 sovs. or cup at option; the entrant of the second 5 sovs. or cup at option; and the entrant of the third 3 sovs. or cup at option.

Several of the competing machines possessed interesting features. For example, Schmidt's N.S.U. was fed by a Claudel-Hobson carburetter, car size. D. C. Bolton rode a machine which was erected at his uncle's private workshop, and was fitted with a special short stroke J.A.P. engine. Pollard rode a Quadrant with a flat belt; and Slatter's Alcyon was fitted with a C.A.P. carburetter.

Thanks to the kindness of Mr. A. V. Ebbelwhite, we were given a lift on the B.A.R.C. Sizaire to the starting-point, whence the start and the first and second lap performances could be witnessed. D. C.

A REAL LIGHTWEIGHT.

D. C. Bolton's home-made racer, which is fitted with a 1 h.p. J.A.P. engine.

Bolton failed to start, and lost much time in coming back for a second attempt; Pither (Rudge) shed his belt at the outset; and Schmidt (N.S.U.) failed to get under way. At the end of the first lap, Slatter led by about a mile, Powell rode second, and the remainder flashed past as follows: D. C. Bolton, Weatherilt, Hands, Pollard, Oldman, E. J. Bolton, Winfield-Smith, Slaughter, Hill, Martin, Johnson, C. R. Collier, Godfrey, and H. A. Collier.

The second lap order was considerably changed. Weatherilt led, followed by Hands, Pollard, Oldman, Martin, Winfield-Smith, Powell, C. R. Collier, D. C. Bolton, Hill, Godfrey, H. A. Collier, and E. J. Bolton.

Slatter was going so well at the end of the first lap that he appeared to be certain for a place at least, but a broken belt put him out of the running.

C. R. Collier had a stiff task to overhaul everybody from scratch, but his now famous chain-driven Matchless travelled at a splendid speed, and the winner

H. W. Hands (2½ h.p. Junior T.T. Zenith-Gradua) winner of the $8\frac{1}{2}$ miles handicap at a speed of 55½ m.p.h.

was the only competitor he did not pass. The final result was as follows:

Rider, cylinder, and machine	Bore and stroke.	c.c.	Start M. S.
1. H. W. Hands (1 cyl. Zenith-Gradua) ...	76 x 65.5	299	2 45
2. C. R. Collier (2 Matchless) ...	90 x 78.5	998	—
3. P. Weatherilt (1 Zenith-Gradua) ...	76 x 65.5	299	2 45
4. O. C. Godfrey (2 Indian) ...	82.5 x 93	998	6
5. H. A. Collier (2 Matchless) ...	90 x 77.5	984	6
6. H. Martin (2 Martin-Jap.) ...	76 x 55	498	2 24
7. W. O. Oldman (1 Zenith-Gradua) ...	85.5 x 85	488	2 24
8. W. Pollard (1 Quadrant) ...	81 x 88	453	2 45
9. G. Hill (1 Rudge) ...	85 x 88	498	1 51
10. E. J. Bolton (1 Martin-Jap) ...	76 x 65.5	299	2 36
11. D. C. Bolton (1 Bolton-Jap) ...	60 x 53	150	5 30

The success of the Junior T.T. Zenith will be noted.

The winner's speed was 55.5 m.p.h.

Some splendid flying was witnessed during the afternoon, despite two heavy showers. First Pixton battled with half a gale of wind, and then later, after the wind had dropped, five aeroplanes were at times in the air at once.

Group of Nottingham and District M.C.C. officials at the Old Cross, Crick, Derbyshire. Left to right they are R. E. Massey, J. King (sec.), and H. W. Gardiner.

QUALITY STILL TELLS!

MARVELLOUS RECORDS

—ON—

PRATT'S PERFECTION MOTOR SPIRIT

At Brooklands, Oct. 3rd, Mr. Stanhope Spencer,
on Rudge-Whitworth Motor Cycle, set up the
following records on Pratt's Perfection:—

Flying 5 miles	-	4 minutes 33 $\frac{3}{5}$ seconds.	1 hour	-	-	-	65 miles 803 yards.
" 50 "	-	45 " 34 $\frac{1}{6}$ "	100 Miles	-	1 hour 34 minutes 8 seconds.		
		2 hours	-	-	122 miles 210 yards		
Sidecar Record, with passenger, for one hour			-	-	40 miles 1,660 yards.		

SPECIAL NOTICE to READERS of "THE MOTOR CYCLE."

A NEW EDITION of this USEFUL BOOK IS NOW READY.

EXTRACT FROM PREFACE TO THIRD EDITION.
In thanking the Press and Public for the kind reception accorded to the two previous editions, I desire to explain that the present (3rd) edition contains many minor alterations, and two main additions. The first is a radical revision of the sections referring to chain transmission. . . . The second is a special section devoted to the Scott two-stroke engine.

ROAD RIDER.

¶ Crammed with valuable information and useful "wrinkles"—which represent the experience accumulated in years of riding and by intimate association with the sport and pastime from its early days—this book will prove helpful to every user of a motor cycle. Nearly 400 Hints and Tips are given, and reference is rendered simple by marginal sub-titles and a copious index.

Price 1/-

By post, 1/2

*Small enough for your pocket or valise, yet big
enough to help you out of numberless difficulties.*

Obtainable of all leading Booksellers and Railway Bookstalls, or direct (with remittance) from Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.

In answering these advertisements it is desirable to mention 'The Motor Cycle.'

ARIEL MOTOR CYCLING SUIT

Double-breasted Jacket, made in strong cashmere to twill lining. Rubber proofed. Will keep out the heaviest rain indefinitely. Fitted with wind cuffs, wrist tabs, non-conductors. Stock sizes, 36in. to 44in. chest.

CENTAUR OVERALLS.

Fitted with V-shaped wind shield and fastened with patent spring clasps. Stock sizes, 28in. to 32in. inside leg measurements.

THE MANOR BELT.

is a great favourite with motor cyclists. Can be supplied any length up to 9ft., and in four sections: 1/2 in., 1 in., 1 1/2 in., and 2 in. Your local agent will show you one.

Appearance, Comfort, Serviceableness
are factors that have popularised

DUNLOP

MOTOR CYCLE CLOTHING.

The above illustration represents the Ariel Motor Cycling Suit. It is designed at the suggestion of practical motor cyclists, who are thoroughly *au fait* with riders' requirements.

Among the hundred and one other seasonable requirements in the DUNLOP range are leather suits, leather vests, leggings, caps, driving gloves, goggles, etc. All described in our booklet, which will be sent on request.

In answering this advertisement it is desirable to mention "The Motor Cycle"

A Run on the 1912 Rex Sidette.

A FEW days ago we had an opportunity of an extended trial of a new 6 h.p. twin-cylinder motor bicycle and sidecar, which the Rex Motor Manufacturing Co. have introduced for next year, the engine bore and stroke of which are 77.5×95 mm. = 896 c.c. When we took the machine over it was with the idea of testing it on some of the steepest hills in the Midlands; we therefore directed the steering wheel towards the Cotswold Hills, where there are some famous banks which are calculated to try the hill-climbing capabilities of any motor cycle.

The 1912 6 h.p. Rex Sidette with its load of 24 stones near Stow-on-the-Wold.

Leaving Coventry, we were soon in Stratford-on-Avon, and were agreeably surprised to find that the machine, with a combined weight of 25 stones, would ascend a short steep gradient outside Stratford called Bardon Hill on top gear of $4\frac{1}{2}$ to 1. Continuing to Broadway, the left hand turn was taken to Winchcombe. There are several short hills on this route which the machine took in its stride, but we quite expected to have to drop the gear on the long ascent from Winchcombe to the top of Cleve Hill, which overlooks the lovely Severn Valley. However, a change down was unnecessary, although there are some awkward bends where cutting out is practically imperative if one is driving with consideration for other road users and one's own safety. The view from the top of Cleve Hill is very beautiful, and on the particular morning in question the whole of the valley was bathed in sunlight and there was not a cloud in the sky.

Novel flywheel balancing on all Rex engines. The rim is cast eccentrically on the discs, and is claimed to provide a better balance and higher speed.

The descent to Cheltenham only occupied a few minutes, and the sidecar and its passengers were soon on the way to Birdlip *via* Leckhampton. However, the guide proved inaccurate, and eventually we found ourselves on the road to Cirencester. A signpost pointing to Cowley caused a halt and an investigation, when we discovered that we had taken the wrong road out of Cheltenham. Leckhampton Hill is a continuation of the Bath Road, and to get to it the best way is to pass

Stretton's Garage. However, we retraced our steps to Seven Springs, and passing the Air Balloon (a public-house), soon found ourselves at the Royal George Inn. The gradual ascent to the top of Birdlip by this route was accomplished without a change of gear, and although it may not be a startling performance, it is a very sufficient proof that the engine does not overheat and has an ample reserve of power.

The Ascent of Birdlip Hill.

After lunch and witnessing some car trials, and the ascent of Birdlip by Miss Hough on a $2\frac{3}{4}$ h.p. two-speed Douglas, we descended the hill

and made an ascent without a falter. As we expected, the gradient at the Knap brought the low gear into requisition, and although the high gear was tried just beyond, the engine speed was too slow and the gradient too steep to enable it to be employed. The low gear of 9 to 1, however, brought the combined weight up the hill without an effort; in fact, there was a big reserve of power for a steeper gradient had it been there. Again descending Birdlip, we tackled the hill from the foot to the Air Balloon; this turns off from the Birdlip-Gloucester Road to the right, and is called Crickley Hill. This is not an easy climb, but, of course, not the equal of the direct road over the Cotswolds to Birdlip village. The journey home *via* Stow and Moreton was accomplished without incident, except that the high speed clutch had a slight tendency to slip, which was afterwards found to be due to a brass lever having slightly given way.

For 1912 the Rex Motor Mfg. Co. will list the following models: $3\frac{1}{2}$ h.p. single and 6 h.p. twin, both with fixed gear, cone clutch, or two speeds; and the Sidette with twin engine and two speeds. There will, therefore, be in all seven models, but only two different sized engines. This simplifies manufacturing operations, and yet enables practically any motor cyclist to make a suitable selection.

Rex timing gear, showing side-by-side valves. Both inlet and exhaust valves are operated by the same cam.

Lock nut on magneto armature-shaft. When reversed and screwed inside recess of sprocket it locks against end of shaft and withdraws sprocket.

The sidecar body springing. Observe the arrangement of coil and leaf springs. The seat suspension is most comfortable.

Freight Charges and Duties on Motor Cycles Shipped Abroad.

IN our issue of February 19th, 1908, we published some particulars relating to the cost of shipment of motor cycles from England to colonial and foreign ports. This information was greatly appreciated by our readers—so much so, indeed, that when we decided to bring out the present special Overseas issue we resolved to publish not only the revised rates and duties for the places previously dealt with, but to give them for practically every country in the world where motor cycles are likely to be sent. We very frequently receive enquiries from our readers for information of this kind, and the accompanying table of rates, etc., should therefore prove useful to many who may contemplate sending or taking machines abroad. The date of the issue containing this table should be noted, and the paper kept handy for reference purposes.

Messrs. Davies, Turner, and Co., Ltd., the old-established foreign carriers and underwriters, of 52, Lime Street, London, E.C., supplied us with the particulars which we published on February 19th, 1908, and the same firm has been good enough to furnish us with the very valuable information which

we publish this week. Readers should note that on the receipt of exact measurements and weight. Messrs. Davies, Turner, and Co., Ltd., can generally quote more advantageous terms than those given in the table. They will also supply, on application, details of the instances where the consular charges are extra (these items are marked by an asterisk in our table), and also particulars of the cases where second-hand motor cycles can be sent duty free. We might point out that the prices given are for one machine, as, of course, it is unusual and generally inadvisable for more than one motor cycle to be packed in a single crate. Therefore, to arrive at the cost of freight, duty, etc., on more than one machine, it will, in practically every instance, be only necessary to multiply the price given, by the number of machines to be sent to the same place.

The prices given are for carting, packing, and shipping a motor cycle, when the bulk of the case does not exceed 25 cubic feet and the total weight 3 cwt. The rates are those at present in force, but it should be noted that they are liable to alteration, without notice, at any time.

5 h.p. Twin-cylinder.
"RIDING ON AIR."

THE 'A.S.L.' MOTOR CYCLE

One client writes:

"After a full season's riding on one of your 3½ h.p. motor cycles, I feel I ought to tell you how absolutely satisfied I am with same. The beautiful manner in which the air springs absorb the road shocks make it a machine that the most liverish person could ride."

Another writes: "I feel convinced that anyone who tries your A.S.L. machine will never ride any other."

MADE IN TWO MODELS: 3½ h.p. single-cylinder, 5 h.p. twin-cylinder.

Stand No. 103, Cycle & Motor Cycle Exhibition, Olympia.

Full particulars post free on request.

— EVERY FRIDAY —

HUNTS Ltd.

The City & West End Motor House
117, LONG ACRE, LONDON, W.C.

RELIABLE ACCESSORIES AT
London's Lowest Prices

"ANTARNISH."

A non-greasy, weather-proof and INVISIBLE Lacquer for applying to the plated parts of Motor Cars, Cycles, etc., and also to bare clean steel, brass, or any other metal.

Price per tin, 9d. Postage 2d.

"COVEROLE."

For Repairing Leaky Petrol Tanks, Pipes, Unions, etc.

DIRECTIONS:

For Worn Unions.—Paint the treads and cone liberally with Coverole, screw up tightly and give a final application to the outside.

Price 1/-. Postage 2d.

For Cracked Pipes, &c.—Smear a piece of paper, canvas, tape or similar material with Coverole, and wrap tightly round the pipe.

"ROSCO"

CYLINDER PAINT.

Keeps the engine cool, prevents overheating, produces a smooth dead black surface. Unaffected by heat or water.

Price per tin, 6d. Postage 2d.

THE HUNT MAGNETO AND ENGINE PROTECTOR.

For fixing in front of engine, and thereby protecting engine and magneto from mud and dirt. In solid leather, both sides enamelled black.

Price 4s. 6d. Postage 4d.

THE HUNT MAGNETO COVER.

Manufactured of best patent leather, far superior to rubber as it does not crack or perish. Will fit all types of magnetos.

Price 2/3. Postage 2d. extra. Protects the magneto from dust, dirt, rain, etc.

THE NEW MODEL MUD PROTECTOR, With Side Wings.

Manufactured of best patent leather, strengthened with iron supports. It is attached by means of thumb screws to front mudguard, and can be fitted to any make of machine in one minute; protects both rider and motor from all dust and mud thrown up by the front wheel.

Price 5/-. Postage 4d. extra.

SPECIALLY PREPARED REPAIR BANDS.

For use on outside of cover after same has burst or been gashed. The outside edges are tucked inside rim, i.e., between rim and cover.

Price 1/-. postage 2d.

Motor Cycle Box Spanners.

Containing six sizes, with tommy. English manufacture. Guaranteed.

Sizes 5/8, 3/4, 7/8, 1, 1 1/8, 1 1/2 in. Price 2/6 set, postage 3d.

THE "HUNT" REGD. COAT.

This coat is essentially a storm one. From the collar, where the opening is started under a watertight pocket, to the bottom the fastening is cut on a curve, so as to fall perpendicularly and down the side of the wearer when riding. This excludes the severest head storm, and gives the user a coat the equal of the leaved poncho without its disadvantages. Pockets are placed not on the hips, where but little can be carried, and with inconvenience, but on the chest. The large one is pleated, and takes Bartholomew's 3in. scale motor map, and has a small cash pocket within. On the other side is a smaller pocket, suitable for a "vest" screw-driver and minor tools. The contest and trials rider will find this coat a boon, for by means of the push buttons used it can be fastened and adjusted while riding, notwithstanding the thickest gloves being worn.

Manufactured of Double Texture Paramatta, thoroughly waterproof, fitted with collar, wind and rainproof sleeves, ventilated under arms. Best guaranteed proofing. Length 58in. Stocked to fit chest 40in., 42in., 44in. (outside measurement).

PRICE, quality No. 1, 40/-. Quality No. 2, 25/-.

The Hunt North Road Overalls, suitable for wearing with the above coat.

Manufactured of Double Texture Paramatta, thoroughly waterproof.

PRICE, quality No. 1, 24/- per pair.

" " " 2, 16/6 "

" " " 3, 13/6 "

THE HUNT DRIP FEED LUBRICATOR.

For inserting in existing oil pipe. Adjustable to any number of drips. Oil can be forced through by pump if desired.

Price (plated) 5/6, postage 3d.

The Hunt

Valve Spring Remover.

By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free.

Price, 2/6 post free.

THE HUNT HELLESEN DRY CELL.

No corroding terminals. No acid. No charging. Always ready, clean, and dry. The "Flash," Height 6 1/2 x 4 1/2 x 2 1/2 in. Approx. mileage, with single-cylinder engine, 1500. Price 6/6. The "Flight" ditto. Height 5 1/2 x 5 1/2 x 2 1/2 in. Price 6/6. The "Midget" emergency ditto. Height 5 1/2 x 4 1/2 x 1 1/2 in. Will run approx. 300 miles. Price 4/4. Postage 6d. extra.

IMMEDIATE DELIVERY

of Motor Cycle Tyres. All standard sizes stocked. Clincher A Won, rubber-studded, 26 x 2, 33/-; tube 11/-, 26 x 2 1/2, 35/-; tube, 11/-, London Agents for Continental Tyres. All standard sizes stocked. Standard patt. 26 x 2 2/4, tube 9/-, 26 x 2 1/2 2/9, tube 10/9, 26 x 2 1/2 3/2, tube 11/6.

Continental Rubber Non-skids, 26 x 2 3/2, 26 x 2 1/2 4/9, 26 x 2 1/2 4/9. Continental combination rubber and steel-studded, 26 x 2 1/2 8/1, 26 x 3 11/10. Rom combinations, rubber and steel studded non-skids, 26 x 2, £2 12s. 26 x 2 1/2, £2 15s. 26 x 2 1/2, £2 17s. 6d.

THE HARTFORD ROUGH RIDER GRIPS.

The ideal grip for motor cycles. Made of stout studded rubber. Only half the handle is fixed to the rigid bar, the end remaining free. This gives a grip which completely absorbs the slightest vibration and for long non-stop runs will be found a perfect boon. Size 7/8 in. or 1 in. Price per pair, 4s. Postage 3d.

THE COWEY SPEED INDICATOR AND MILEAGE RECORDER (Guaranteed).

Registers a speed up to 60 miles per hour. Mileage recorder registers up to 10000 miles, then automatically starts again. The indicator can be easily attached by any motorist, and once fitted requires no attention or adjustment whatever. It will continue to render good service as long as it is attached to the cycle, for it is constructed throughout of the best and most suitable materials by expert British mechanics at Kew Gardens. Price, in Nickel, 84/-, carriage paid.

THE "ACME" WATCH AND CASE.

These Watches are constructed to stand vibration. Each watch guaranteed for twelve months. To clip on handle-bar. Very neat. Made in Aluminium. Complete with Ingersoll Watch.

Price 8/6, postage 2d. Case only, 3/6.

THE "PATCHQUICK" REPAIR OUTFIT.

Motor cyclists will find this equipment a boon and a blessing, and will save themselves much leg-aching and heart-breaking by being able to repair their worst punctures, etc., within five minutes.

Price 3/-. post free.

Illustrated Catalogue sent gratis and post free.

In answering this advertisement it is desirable to mention "The Motor Cycle."

* Consilage charges extra.

To find cubic measurement of a motor cycle when packed in a case, measure its greatest height, breadth, and length, add six inches to height and two inches to breadth and length for packing, and cubic contents = height × breadth × length.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Mansfield to Spalding.

Please let me know the best route for a motor cycle from Mansfield, Notts., to Spalding, Lincs. Are there any police traps to be avoided on the route?

Kindly let me know the distance between each town.—R.W.S.

Your best route would be as follows: Mansfield, Southwell (11½ miles), Newark (7½ miles), Grantham (14½ miles), Threkingham (12½ miles), Donington (7½ miles), Gosberton (3½ miles), Pinchbeck, Spalding (6 miles)—total, 63½ miles. Ride carefully from Bennington to Grantham.

Easy Starting.

My 1911 pattern lightweight is not a success for business, having to make frequent calls, as I cannot start it seated by pedalling except on a slope. However easy it may be I feel it impossible to get into the way of running with it and vaulting to saddle by pedal. What would you advise?—A.S.

Under the circumstances we should advise you to buy the lightest possible machine you can and start by pedalling, unless of course, you can have a free engine and change speed gear fitted to your present machine, which would allow the engine to be first started, and you could then start by engaging the low speed.

Vibration.

I am thinking of taking up motor cycling, and would be glad if you would answer these few questions: (1.) As I have been ill I want the cycle with the least vibration; in fact, I should like the vibration to be practically nil. Is there much difference in the vibration between the lightweight and the heavier class and between single and twin cylinders? (2.) Is it possible to go at five miles per hour on a 5 h.p. machine?—H.P.F.

(1.) As regards road vibration, we do not think there is much difference between the lightweight and the heavyweight, but a twin will give considerably less engine vibration. If you find starting a difficulty it would perhaps be better to go in for a lightweight machine. The great thing to do is to get a really comfortable saddle. (2.) Certainly; when a change-speed gear is fitted it is possible to travel at four miles an hour with a 5 h.p. engine.

Machine for Sidecar Work.

I propose changing my 6 h.p. Chater Lea-Jap single gear for some reliable two-speed or multi-gear machine. I want one that will take itself, sidecar and passenger up anything it is likely to come across, and I prefer a twin Jap engine. I also want one that will act as a solo mount when desired. The machines I fancy are Zenith 6 h.p., Matchless 6 or 8 h.p. two-speed, Bat-Jap 6 or 8 h.p. two-speed, or four-speed if it is possible to get it. Is the Zenith a thoroughly reliable machine, and can you get it to start by handle instead of requiring to run alongside of it? I simply cannot do with that run alongside, as I am a country doctor, and require to mount possibly twenty or thirty times a day.

From that you will see I must have a machine to start easily, by hand for preference. I very often use a sidecar, and I object to shed my passenger as I am obliged to do now sometimes. I will be glad if you will tell me what you consider the most reliable mount for the above purpose, and if it is better to wait till after the November Exhibition before doing a deal. One other thing. Do you prefer a chain or a belt drive? From your paper, the chain seems to be coming to the fore.—A.B.

All three machines mentioned in your letter are quite reliable, and, having the same engine, it is a question of personal choice. Perhaps it would be better to wait until after the Show before you make a purchase. Certainly, for sidecar work, we prefer chain transmission.

HILL-CLIMB AT STAINBORO' LOWE, OPEN TO MEMBERS OF THE NORTHERN LEAGUE.

The results of this contest, which was organised by the Doncaster and District M.C.C., are given on our club news pages.

October 2nd.

C. R. COLLIER on— Shamrock-Gloria Belts

Dear Sirs,

September 8th, 1911.

I beg to inform you that in my recent record rides, in which a speed of over 91 miles per hour was attained, the belt fitted to my machine was one of your standard Shamrock-Gloria lin., which gave me every satisfaction. I think it is most remarkable, and a fact which speaks well for the quality of your belts, that one of this section should transmit the enormous amount of power developed by this engine, which is something in the neighbourhood of 14 h.p. It will also be interesting for you to know that I have tried several other makes of belts on this machine, but could not find another one to stand up to the work it had to do. I also used the same section belt, and with the same success, in the recent T.T. Race, which event I should easily have won but for a silly mistake on my own part.

In conclusion, I am convinced that the S.G. is still by far the best belt on the market, and I take this opportunity of wishing you continued success.

Yours truly,

C. R. COLLIER.

H. TAYLOR & CO., 21a, STORE STREET,
TOTTENHAM COURT ROAD, LONDON, W.C.
Telephone—10957 Central. Telegrams—"Dynametro, London."

Wanted, a Book.

? I am hoping shortly to get a motor cycle and sidecar, and (1) should be greatly obliged if you could tell me of any publication which would enable me to understand the workings of the engine, etc. It should be elementary and not too technical, as at present I am an ignoramus. (2.) I am told that the Bradbury, Scott, and Triumph are all good makes; is that so?—J.C.S.

(1.) What you require is "Motor Cycles and How to Manage Them" (1s. 2d. post free from 20, Tudor Street). (2.) The machines you mention are all very good and reliable in every way.

Engine Too Hot.

? I found some months back that my engine was only getting oil occasionally, owing to leather washer in the pump being worn. The result was I had to have it taken down and re-bushed. In spite of this the engine overheats, and appears to me to "hammer" along and make more noise than it should, and more vibration is felt than before the trouble. When I say the engine overheats, I will explain by saying that after a mile or two the crank case (upper half) is too hot to touch, as also is the throttle sleeve of the carburetter. Does this signify that the engine gets too hot? With regard to the carburetter, when a speed of about 25 miles has been attained the engine will take full air and about one-third throttle, but until this speed has been reached it will only take a little more air than throttle with the cut-out open. With the cut-out closed it takes rather less air than throttle if latter is about one-third open. Do you think (a) there is overheating; (b) I could cause any improvement by fitting a smaller jet; (c) is there any other cause for the overheating—could you make any other suggestion to improve the running? (d) Is it better to ride with cut-out open?—M.D.

We have carefully considered the symptom described, but cannot see that this directly points to overheating, but only to the engine getting somewhat hot. The unmistakable signs of overheating are pre-ignition and a slowing down of the engine, which results finally in a complete stoppage. The lubrication seems to be about right.

With regard to the behaviour of your carburetter, this is quite as it should be, except that still more air should be taken at a high speed. It is worth experimenting with a smaller jet, especially in the hot weather. Of course, it keeps the engine cooler to run with the cut-out open, but it is most annoying to other road users.

Preston to Ruthin (Wales).

? I intend riding to Ruthin (in Wales) shortly. Would you kindly give me the best and most direct route from Preston and the mileage?—P.M.S.

Your best route would be as follows: Preston, Ormskirk, Liverpool, by ferry to Birkenhead, then through Eastham, after which you take the first important road fork on the right, and go through Mold to Ruthin. The distance is approximately sixty-four miles.

Two-speed Gears.

? Will you please tell me whether there is any reliable two or three-speed gear which could be easily fitted to a free engine Triumph motor bicycle?

I do not wish to fit anything that is not thoroughly reliable.—C.W.K.

The following could be fairly easily fitted: N.S.U., N.S.U. Motor Co., 186, Great Portland Street, W. Armstrong Three-speed, Armstrong Three-speed Gear Syndicate, Ltd., Icknield Street, Birmingham. Millennium, Lake and Elliot, Ltd., Albion Works, Braintree, Essex. The Gradua gear is made applicable to a Triumph, also the Roc conversion set is largely used.

Manchester-Tenby-London.

? Please give me the quickest route from Manchester to Tenby (South Wales) and from Tenby to London, together with the distances. I do not mind hills, but want good roads.—G.S.

The routes you require are: (1.) Manchester, Northwich, Chester, Wrexham, Oswestry, Welshpool, Newtown, Llandilo, Aberystwyth, Cardigan, Tenby—130 miles. (2.) Tenby, Carmarthen, Llandilo, Llandovery, Brecon, Abergavenny, Monmouth, Ross, Gloucester, Cheltenham, Andoversford, Northleach, Witney, Oxford, High Wycombe, Beaconsfield, Uxbridge, London—245 miles.

The Effect of a Fall.

? I shall be obliged if you will tell me how to remedy the defects mentioned hereunder, which have become apparent in my 1909½ 3½ h.p. Humber cycle since it sustained a bad fall some days ago. The machine when in its normal condition would always run well on quarter throttle and threequarter air, with ignition fully advanced. Since the spill, however, it is extremely difficult to start, will not start unless the spark is fully advanced, throttle wide open, and air shut off. When it gets going, it will not take any air at all, and when running on full throttle it very soon gets about red-hot if I allow it to run long enough. I find that if I keep on depressing the carburetter plunger when I am riding, the machine at once gathers speed, and will take air as formerly, but immediately I cease to do so, unless the air lever is at once closed, it stops directly until the air is shut off. Is it possible the petrol level in carburetter has become altered in the fall, with the effect of starving the jet? If so, how is it remedied?—A.M.P.

Your suggestion seems to be the correct one. Your best plan will be to get a new needle valve from Messrs. Brown and Barlow, of Birmingham, at a cost of 1s. You can raise petrol level by driving the collar on the needle towards the point.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"R.W.M." (Whalley). 3½ h.p. Zenith-Gradua.

"W.H.R." (Bury). T.A.C., particularly with regard to silence, reliability of gears, also for sidecar work; also Binks two-jet carburetter.

"G.S." (Ilford). Kempshall heavy non-skids on 3½ h.p. and sidecar.

"Novice" (Peterborough). 3½ h.p. two-speed Kerry Abingdon with a sidecar.

"B.D. 1192" (Northampton). 5-6 Bat-Jap, P. and M. gear and sidecar, petrol consumption, life of tyres, etc.

"F.T." (Hampstead). 3½ Zenith-Gradua with sidecar.

"S." (Perthshire). (1.) Eli mudguard (with speedometer). (2.) Chemico, F.R.S., and Brooks's backrests.

Members of the Walthamstow Motor Club who attended last week's run to Audley. Passenger motor cycles have always predominated at club runs of the Walthamstow members.

The Ubiquitous Motor Cycle.

A.C. tricarcs and sociables are in use in India, Mexico, the Straits Settlements, South Africa, Japan, Nigeria, Australia, and New Zealand, not mentioning most European countries.

New Appointments.

Mr. Harold Williamson, late sales manager of the Rex Motor Manufacturing Co., Ltd., is now engaged with Singer and Co., Ltd., of Coventry. His brother, Mr. W. Williamson, has also resigned his position as managing director of the Rex Co., and will shortly be heard of in another capacity.

Winter Riding Equipment.

The Service Company, of High Holborn, who make a point of anticipating the wants of motor cyclists, are introducing what promises to be a most useful addition to the rider's winter outfit. It is an overboot, and is in effect a knee-high boot minus the heel and the back part of the foot portion. The leg portion is divided down the back and fastens with patent clips. It affords ample protection to the whole of the foot and the leg from the knee downwards, and has the great merit of being easily slipped on or off.

Gear Lubrication.

The almost universal adoption of change-speed gears causes one to think that before long the method of lubricating the gears will have to be considerably improved. There is no reason why it should be necessary to remove a screw, plug, or similar device, and inject a pumpful of oil every two or three hundred miles. A first-class car gear is usually lubricated by means of an oil pipe, i.e., if the box be oiltight. A lead from the usual motor cycle oil pump with a two-way tap would overcome all difficulty, and although we recognise that it is very difficult to arrange in the case of epicyclic gears which revolve either with the hub or engine-shaft, it is comparatively easy with counter-shaft gears with a stationary box.

British Machines Abroad.

P. and M. two-speed motor cycles have been sent to all parts of the world, viz., Australia, New Zealand, Federated Malay States, South Africa, India, Ceylon, Nyassaland, Japan, Mexico, and South America.

A Double Spiral Piston Ring.

The Lehmann double spiral piston ring is manufactured by A. Binet et Cie, and sold by the City Ignition Co., 274a, Goswell Road, E.C. This ring consists of two spirals wound one above the other with one head only to each complete circle. The advantages claimed for it are that the ring having no interruption of continuity is absolutely gas tight and no pegs are required to prevent it turning round.

A Lightweight Power Unit.

Messrs. Leo Ripault and Co., 64a, Poland Street, Regent Street, W., are turning their special attention towards a motor set which can be attached to a

Herdtle-Bruneau engine set for a pedal bicycle.

pedal cycle. They guarantee that the Herdtle et Bruneau motor set, which we illustrate, enables a pedal bicycle to be converted into a motor bicycle with no alteration to the frame. The illustration shows one of these sets complete, consist-

ing of a 1½ h.p. water-cooled H. and B. engine, radiator, magneto, carburetter, tank, and belt pulley.

New Models on the Road.

We saw the first couple of new model 3½ h.p. Humbers on the road last week, undergoing tests at the hands of those veteran riders, Bert Yates, and Sam Wright, who were both enthusiastic in their praises of the 1912 offset engine. They called upon us to demonstrate the utility of the half compression device, and it was indeed impressive to see Wright walking alongside his single-gear machine with the engine firing regularly at 4 m.p.h. The exhaust of the new Humber resembles the Triumph and the Rudge, but to the practised ear it is neither one nor the other.

Lehmann's double spiral piston ring.

Lubricating Hubs and Clutches.

Is there any reason why the average motor cycle hub, with or without clutch, should be lubricated by means of an enlarged cycle lubricator in the centre of the hub barrel? Would it not be far better and more accessible to have lubricators on each side of the barrel, or make a screwed connection to the oil gun or squirt, so that, when it is screwed on to the pump and the oil injected, no leakage can occur? What usually happens now, unless one be very careful, is: the squirt is filled and the lubricator opened, the point of the squirt is inserted in the lubricator (so-called) and the plunger depressed, and unless great care be exercised the majority of the oil gets on the tyre cover and rim instead of in the hub. By the way, on one or two machines we have ridden it is an easier matter to inject oil into the hub clutch with the engine and belt rim running and the back wheel at rest. The revolving clutch parts seem to draw the oil in.

Both sides of the 4 h.p. single-cylinder M.M., a leading American mount represented in this country by J. C. Lyell and Co.

A NEW EDITION
of
Faults and
How to Find Them,
by J. S. V. Bickford, B.A.,
IS NOW READY.

by J. S. V. Bickford, B.A.,

Q The author of this book has adopted a very clever yet simple method of locating motor car faults. The plan may best be described as *discovery by elimination*. Certainly it will appeal to the novice, who, when anything goes wrong with the car, seldom knows *where to begin* to look for a fault.

One hundred and eighty Faults are included, and **A REMEDY IS GIVEN FOR EACH FAULT.**

The book is invaluable to every motorist who wishes to understand his car.

Obtainable by post from ILIFFE & SONS LTD., 20, Tudor Street, London, E.C.; also from all leading Booksellers and Railway Bookstalls.

In answering this advertisement it is desirable to mention "The Motor Cycle."

TO USERS OF SIDECARS AND TRICARS

Your chief trouble is your rear tyre. Unless very fortunate, you are continually in trouble. Why? Because the ordinary motor cycle tyre cannot stand the strain. It cannot be expected to do the work of a car tyre.

A CAR TYRE will not fit your rim. The only alternative is to fit a cover made on car tyre lines for a motor cycle rim. You also want something stronger than rubber on the tread. The tread should be of special hard steel studs that will not break off or pull out, and the casing should be specially re-inforced. Then you have an ideal tyre for your work. The maximum of strength for the minimum of weight. The tyre illustrated is made on these lines, and costs very little more than an ordinary rubber cover. You can have the same tread fitted to your own tyre.

HARRODS WILL SUPPLY ANY STANDARD MAKE OF MOTOR CYCLE ON THEIR UNIQUE AND EASY SYSTEM OF DEFERRED PAYMENTS.

Briefly, the system is as follows:

One-fourth of the purchase price is payable on delivery, the balance being paid in equal monthly instalments. Harrod's clients thus have the full use of the machine from the date of first instalment, and enjoy its use while paying for it out of income without having had to disturb capital. These obvious advantages involve an extra cost of about 1 per cent. on the regular price—an infinitesimal amount.

For further particulars, illustrated catalogues, or expert advice, write MOTOR CYCLE DEPT., HARRODS Ltd., LONDON, S.W. (*Richard Burbidge,*
Managing Director)

THE 'JONES' MOTOR CYCLE SPEEDOMETER

ACCURACY, RELIABILITY, GOOD SERVICE.

**The Gold Medal
Speedometer.**

Prices:
3, 4, & 5 Guineas.

Extract from "The Motor Cycle,"
Sept. 14th, 1911:

**The Inestimable Value of
the Speedometer.**

I notice many riders still
pursue the hobby without
the aid of a speedometer.

It is indispensable to the competition rider, for its readings tell him how he stands for both time and distance—the vital factors in the modern trial. It is equally indispensable to the private tourist, for it affords valuable information about engine tune, petrol consumption, state of one's tanks, and so on, besides guarding him against slowing down too little for a bad corner after a burst at high speed.

Nothing is more deceptive than dropping the pace after a sprint; the machine is invariably travelling much faster than one fancies, and most of the accidents at corners are due to this deception.

ADDRESS: 20. TUDOR STREET. LONDON, E.C.

1912 Competitions.

AN important meeting of manufacturers was held last week, when the question of next year's competitions was discussed. The outcome is that about twenty members have signified their willingness to sign a bond agreeing not to compete directly or indirectly in a Tourist Trophy Road Race next year, the arrangement to hold good for one year only. This, of course, means that if the event be held, the A.C.U. will be forced to look elsewhere for the major support in the way of entries, the biggest proportion of the entrance fees having been received from trade entrants in the past.

The members of the Manufacturers' Union who are prepared to abstain are not antagonistic towards racing, but they are of the opinion that the conditions of the Isle of Man races are not conducive to the best results, i.e., the perfection of a touring mount.

The suggestion which has already been published in these columns, viz., that the T.T. be held at Brooklands, would appear to meet with favour, because, provided the race be held under touring conditions, the majority of the makers would be willing to support a long-distance race at Brooklands.

Of course, the makers' decision may not prevent races similar to those held in 1911 being run again in the Isle of Man, but the A.C.U. will have to depend on private riders, and they will have to be real amateurs, not masqueraders, because the bond will provide for the "shamateur," and makers will be under a very heavy penalty if they are discovered to have subsidised a rider in any way whatsoever.

There are objections to holding a long-distance race on Brooklands, and one in particular, which is that variable gears could not be tested quite so well.

Variable gears are of service on a track like Brooklands, where the wind may be against the rider for nearly a mile and in his favour for the rest of the distance, but a course including severe hills is necessary to show variable gears to advantage.

The October Quarterly Trial.

THE outstanding feature of the above competition held last Saturday was undoubtedly the universal use of the variable gear. There were only two fixed geared motor cycles employed. Still, the trial proved that the change-speeder is not the "go-anywhere" machine it is supposed to be, and we fancy that the A.C.U. defeated its own object in settling on such a trick hill as Farlow. It is not a very striking demonstration of hill-climbing abilities for only sixteen out of forty-nine machines to make clean ascents. All but five of the competitors who reached Birdlip successfully climbed it, but this is a main road hill. Change speed gears assisted largely toward this end, and although we witnessed the ascent of Birdlip by several non-competitors on single-gear motor bicycles, they were able to wait at the hill foot and cool their engines, whereas the actual competitors had to take this formidable Gloucestershire acclivity on the run and with hot engines.

Had the weather been wet and the roads heavy there might have been considerably more failures, and probably none at all would have got up Farlow, such was the condition of the surface.

A notable point in the hill-climbs was the general improvement among the passenger machines. No prospective purchaser need hesitate to purchase one of the seven passenger makes represented on the score of hill-climbing.

FROM THE CHANNEL TO THE ADRIATIC & MEDITERRANEAN & BACK

By Motor Cycle.

By R. M. B. J.

ALL preparations having been made, and armed with customs tickets, G.B. plaque, passport, and other necessary papers, I set out, heavily loaded, from the little village of Orlingbury at 7 a.m. on Monday, June 26th, *en route* for London (seventy-four miles) and Folkestone. It was very trying passing right across London with the heavily loaded machine, as all the Coronation decorations were up and traffic very heavy. Also I had heavy non-skid Kempshalls on both wheels, and not being used to a heavy tyre on the front wheel, the steering "swung" a good deal. I soon got used to that, however, and arrived at Folkestone Pier after a fast run, having arranged to meet my companion, X, at three o'clock.

Luggage Equipment and Embarkation.

Four o'clock came, and he had not arrived. Meanwhile I had booked my ticket and had the machine put on board; the machines are swung on board on platforms. The freight is excessive, being governed by weight, but I succeeded in getting the clerk to accept the machine's catalogue weight (185 lbs.), so it cost me 10s. and 7s. 5d. for myself. Just after four I saw X coming round the corner, and hustled him and his machine on board, and we sailed at 4.15. I may here say that he rode a 1910 free engine Triumph with N.S.U. two-speed, while I had my 1910 3½ h.p. Phelon and Moore. Both of us carried a large quantity of luggage, *e.g.*, I had a large wicker basket full of clothes and parcel of sweaters, etc., on carrier, two pannier bags in strong steel stirrups containing more clothing and spares, on the footboard a pound tin of chain-lubricant, a gallon petrol tin, a quart tin of Price's "A," a "Sirram" scout's boiling set, and a vice.

We arrived at Boulogne in rain, and our machines having been swung on shore after all else the A.A. official saw us through the customs. The travelling pass was filled in and stamped, the *permis de circulation* (60 cents) obtained, and we were off for petrol and light refreshment. At no single customs did the officers examine my luggage, for which I was very thankful, as everything had to be so carefully packed to get it all in.

Bumpy Run to Montreuil.

Over the *pavé* we bumped, across the bridge, and then to the right for Samer. The macadam was little better than the *pavé*, but we were fresh, and did not mind it much. The roads were greasy after the rain, and some miles on we came to a steep winding hill, and about two miles past the top I missed X, and went back, to find him struggling with a slipping (worn-out) belt. He succeeded in reaching the top at last, only to stop and shorten the new belt. Darkness and rain came on. No water in the generators. A wayside cottage gave us water in a bucket, so I dipped the Lucas in. How glad we were to reach Montreuil at 10.30, tired out by rough riding over the execrable roads in the dark. Even at that hour we were able to get a hot six-course dinner—very excellent, and we were hungry—at the Hotel Belle Vue. Our introduction to the "glorious, wide, straight roads of France" was not encouraging, and, turning in at midnight, we slept the sleep of the tired. My mileage for the day was 175.

Roads Ruined by High Speeds.

Tuesday, June 27th.—Away at 9.30, up the paved hill, through the town gate, and having purchased *alcool à brûler*, bread, and provisions,

The writer's 3½ h.p. P. and M. being slung off s.s. "South-Western," at Southampton.

The author—R. M. Bankes-Jones.

From the Channel to the Adriatic and Mediterranean and Back.

we ran on over pot-hole roads, and lunched by the roadside, drinking tea, made with the boiling set and "Tabloid" tea and saccharine. There was a voiturette race on, and cars decorated with various coloured flags kept roaring past (no silencers) at over 50 m.p.h. I wished for the English speed limit, as these high speeds ruin the roads. How the French cars stand the jolting beats me. No wonder they are all fitted with buffers, shock-absorbers, and various devices, and one constantly finds nuts, bolts, etc., on the road, and broken-down cars by the wayside. On through Beauvais (all gay with flags and bunting), over terrible roads to Abbeville, where we visited the cathedral. We found *pavé* in all towns and villages very bad as far as Fontainebleau. Having climbed the steep hill out of Poix, we ran through pretty country, up a long, steep hill

du Printemps, and as it was so late (11 p.m.) we had to be content with an omelette. 126 miles.

A Day of Bad Roads and Repairs.

Wednesday, June 28th.—Leaving at 9.15 (the broken-off pannier joined the petrol tin on the foot-board, and was carried there for the rest of the tour), I reached the top of the long hill out of St. Germain, and waited. Soon after, X appeared, and said his front brake blocks had twisted right round, and nearly stripped the spokes out. Afterwards we discovered that the front rim had been lented over the *pavé*, and every time the brake was applied the blocks twisted round, so they had to be taken off. While he shortened his belt I greased my chains, and having eaten our breakfast by the roadside we at last got going at twelve o'clock.

Versailles is a fine place, and the big parade grounds beat

with five hairpin bends to Grandvilliers. Here I again missed X, but after threequarters of an hour he turned up, having punctured. Resuming, we struck a side road, in excellent condition, to skirt Paris, and made up a lot of time. Crossing the bridge at Pontoise over the river, and again at Conflans—very pretty in the dusk, with lights twinkling—we ran through a long forest. In the middle of it, the steel stirrups supporting the left pannier bag broke, and the whole fell into the road. The terrible bumping and vibration over the bad roads had snapped both supports at the bolt holes. Lighting up and piling the pannier bag on top of the other luggage on the carrier, we pushed on to St. Germain, where we had great difficulty in finding an hotel, the Michelin one being full up. Eventually we slept at the Hôtel

Whitehall, but the *pavé*—a nightmare! Having lunched outside the gates, we were just restarting, when X discovered that the spare Kempshall non-skid he was carrying alongside the back wheel had been cut through by some miscreant. Incidentally I might say that the Kempshalls created ceaseless wonderment wherever we went; at every stopping place the crowd felt them, dug their nails into them, and wondered at the little holes in the covers. We experienced great difficulty in finding the road south of Paris: no one knew where the roads led to apparently. All went to Paris! There was the same difficulty coming back, of which more anon. At last, by way of Essones, we reached the glorious forest of Fontainebleau, with its splendid straight flat roads through the long avenues, its open clearings, and

From the Channel to the Adriatic and Mediterranean and Back.

crosses. Over the improved surface we did some fast travelling until it was my turn to stop with a broken exhaust valve (it had done 6,500 miles): the difficulty in getting the cap to move delayed us about three-quarters of an hour. X discovered a very nasty V-shaped dent in his back rim, which exposed the bead of the cover. By 6 p.m. we had only done twenty-six miles, what with repairs, bad roads, and difficulty in finding our way, but we made good time on to Sens, doing the last few miles in the dark

taken the wheel out, we discovered that really the tyre had deflated with a big nail through it, and so come off. While he took the wheel to a garage I repaired the tube. It was blazing hot all the time. Having fixed up machine again and provided ourselves with a good lunch, we restarted at 3 p.m., having done one mile! Then we lost our way, and found ourselves going N.E. to Troyes, instead of S.E. to Tonnerre. However, taking a secondary road in rather loose condition, I reached Arcas and missed X. Waiting half an hour, I went on, and stopped in a forest to grease the chains, and he arrived soon after. He had had difficulty in starting the engine. Then we lost the way again, and found ourselves S.W. in Auxerre, instead of being at Tonnerre. So we struck off along a smooth wonderfully engineered road, through a valley with vines growing in terraces on both sides, to Chablis, where we stopped and tasted the wine. Then along a hilly, twisty, dusty road, and a long drop down into Tonnerre, and we reached the Hôtel du Lion d'Or at 8.45 p.m. A good dinner, a stroll, and bed at eleven. The roads were quite good all day, and our spirits rose accordingly. Near Chablis my other pannier bag broke one of its supports, so I had to finish the tour with it tied on with string. Day's run—seventy-nine miles.

Friday, June 30th.—Although up at six, we didn't get going until 11.45, and for about ten miles to Vitteaux we thoroughly enjoyed ourselves.

with no lamps. We had to light up, however, to enter the town (9.30). The *pavé* is bad here, and streams of water flow down the gutters. At the first hotel we stopped at we intruded upon a young ladies' dance, and the "patron" was afraid the music would disturb us all night! We went, therefore, to the Hôtel de l'Ecu, a fine old place, with a courtyard, where we had a splendid bedroom and a very nice cold supper. Each night we arrived too late at hotels for dinner. Mileage per day—ninety.

Thursday, June 29th.—Up at eight, and after visiting cathedral and strolling round the town, we filled up with oil, and chatted with a Swiss lady and gentleman, who spoke fluent American-English, and were following our route to Dijon, afterwards branching off for Geneva. They expected us to pass them during the day, and we thought so, too, but we didn't know what was in store for us. Leaving at ten, in 200 yards I ran out of petrol. Got going again, and just reached the end of the town, when I saw X in trouble. He was very glum. Said that the cover had left the rim at the dent. However, after we had

The railway ran alongside the road, and a slow passenger train was going my way. I waited for it at a station, and shouted a challenge to the driver, which he accepted. At 30 to 35 m.p.h. I could easily hold the train level, notwithstanding the ox-waggons loaded with long tree trunks on the narrow road. The driver whistled and I footled, the passengers hung out of the windows, and so we went on together, until at last I went under and the train went over the bridge together, and our ways lay apart.

Occasional Comments 'LXION' BY

SRJ

Chain Sprockets.

The popularity of the counter-shaft two-speed gear implies an increase in machines fitted with chains as one item of their drive. May I respectfully remind makers and users that the attachment of sprockets has been a fertile source of trouble in the past, and that the locking devices used to secure the sprocket ought to be remarkably rigid. If the sprocket is of solid construction, and keyed on a taper spindle, the lock-nut ought to be tightly fastened, either by a patent washer or a second nut. If the sprocket is bolted to a flange, single nuts soon jar off the bolts. Troubles of this nature were very frequent and aggravating with the early tricars, and a firm fitting chains for the first time usually overlooks the need for strong sprocket attachments, while inexperienced users neglect to keep an eye on the locking devices.

A Broken Frame and Its Explanation.

A correspondent writes to ask whether a motor cycle manufacturer is liable to replace a broken frame gratis under the statutory guarantee. My answer is a definite affirmative, unless the machine has sustained several heavy falls. The appended diagrammatic sketch of the frame in question shows that it is very faulty in design, and probably an action for free replacement would succeed. There is a particular reason why the engine is carried offset on one side of the frame on this particular make, and it is obvious to the meanest intelligence that the strain at the joint between tube A B and lug B C is bound in time to lead to a fracture. The machine (a powerful twin) has not been used with a sidecar.

**Dog-clutch Gears.**

A very false impression may be given by a recent letter denouncing dog-clutch gears. Everybody ought to know by now that these simple two-shaft dog-clutch gears are absolutely satisfactory and reliable. The majority of cars possess such a clutch on one gear ratio. The principle has already been triumphantly demonstrated on the Douglas motor bicycle for one.

Foolish doubters should recall the old Riley and Humber single-cylinder tricars. After this lapse of time I suppose I may venture to say that these machines had rather primitive clutches, and that they lacked any device which could materially soften the rigidity of their chain drive. Yet I have seen dog-clutch gear boxes dismantled after five years' hard work on these rather prehistoric three-wheelers, and the sole defects discoverable consisted of worn keyways on the gearshafts. The bearings and the gear teeth have been almost equal to new.

The sole real difficulty in the application of these excellent gear boxes to two-wheelers lies in the

metallic hum of the gear wheels, which is unpleasant to us after the absolute silence of a direct belt drive, but I believe one or two of our leading manufacturers have already gone far towards solving this difficulty.

For instance, the Indian two-speeder has "chain-swish" as well as "gear-hum" to contend with, but it is not unduly noisy on its low gear. This type of gear is simpler and more reliable than many counter-shaft gears embodying the double friction clutch principle, and has the further merit of requiring but two chains, each provided with a simple and substantial means of adjustment. It has come to stay, and its possibilities were emphasised in this journal seven years ago. It was even fitted to old pattern tricars of the De Dion type, but not by the De Dion firm. The result in the case of direct gear driven motor tricycle rear axles can be imagined. The Mercier gear box was one of these, and it had a tiny box which the rider of a lightweight would laugh at in these days.

How Two-speed Gears are Tested.

Occasionally riders grumble because the makers of their pet machines are rather slow in marketing a variable gear. They forget that fools rush in where angels fear to tread. I take a great interest in the evolution of a particular machine, and the gentleman responsible for the policy of the firm replies thus to an appeal from me to market a gear he has patented: "We send our motors into all parts of the world into the remotest wild countries; we cannot and will not send out machines that are not practically foolproof and reliable to the last degree. If any part of the

**HOW MOTOR CYCLES ARE TESTED.**

We noticed the above neat bracket on a Rudge machine undergoing test recently. To avoid scratching the handlebar and in order to fit the speed indicator quickly, it is mounted on a tube which is dropped over the lamp bracket in the manner shown.

Occasional Comments.—

machine had not a large margin of safety, there would be no chance of securing the large colonial trade for which I hope. For next year we shall only make a very limited number of variable gears; these will be sold only to picked riders, but samples will go into all parts of the world, and they must run for twelve months, and give absolute and universal satisfaction, before we turn them out in large quantities." *Si sic omnes!*

Clean Crank Cases.

As usual towards Show time, I put in my annual plea for clean crank cases. Personally I do not particularly care whether my engine keeps tidy or not—I am not one of the dapper riders eager to pose as if I and my machine had stepped out of a bandbox after a 200 mile run. But I understand the feelings of those neater individuals who use boot-trees and polish their gaiters lovingly, and keep a selvyt and a paraffin can and bristle brush in their head lamps. And at present I am very sorry for them, because the dirty crank case nuisance is much, much worse than many people imagine. I do not know a single standard engine which will keep really clean if driven hard and oiled with corresponding freedom. It is true one can see spotless machines at the end of every big trial, but the credit for this goes to the rider, not to the maker. Some of the men use every moment's leisure for cleaning, and others have spent hours in caulking every joint in their engines before the trial started, and will have to face the weary process over again when they take their engines down and break the joints. I was unlucky enough to buy a particularly filthy engine last spring; I tried to make it oil-leak-proof by taking it to pieces and spending hours with paper washers and seccotine, but I abandoned the attempt in disgust on discovering that the surfaces were so undulating that a lot of machining would be essential to a clean job. One of these machines ran in the

Yorkshire trials, and gained golden encomiums from all and sundry because its engine was spotless at the finish, and had received very little attention *en route*. But I happened to know that the rider responsible had laboriously performed the task which I shirked, and all standard editions of this engine are as naturally filthy as my own. One large firm is experimenting with a self-contained lubrication system for the timing gear. There are no oil holes between crank case and timing gear case, the latter being packed with grease which is just too thick to ooze in any quantity from the tappet guides, which are the vulnerable point on the better engines (inferior engines leak at every joint). I doubt the wisdom of this solution; the average duffer will omit to renew the grease. But some solution is loudly demanded; and it will help matters if the embossed advertisements now standard on crank cases are abandoned. One or two firms are wise in embossing their name in such position that they are out of range of oil-flinging. But firms who do not sell "loose" engines can surely dispense with these advertisements altogether.

The Hour and Hundred Miles Records.

I do not know which to admire most—the ingenuity of the engineer who, in response to a broken record, manages to coax another two or three miles an hour out of an engine that had previously been strained to the uttermost, or the stamina of the jockeys who crouch double on a narrow rigid frame and circle round a rough track for sixty or ninety minutes at such frightful speeds. The value of these track records to us road men lies in the proof they afford that the modern engine does not get tired. It was only a year or so ago that the modern $3\frac{1}{2}$ h.p. used to curl up completely on a 1 in 10 grade if its reckless owner kept the throttle two-thirds open for five miles on the flat; to-day a first-class $3\frac{1}{2}$ h.p. can be driven all out for a couple of hours without stopping and without injury to the exhaust valve.

In a pretty Warwickshire lane near Stratford-on-Avon.

Up Edge Hill on a 3½ h.p. Single-gearred Sidecar.

LAST week we witnessed what we believe to be the first authoritatively observed ascent of Edge Hill, near Kineton, on a 3½ h.p. single-gearred motor bicycle and sidecar. There has been a feeling current in the Coventry district for some time that the tests of two-speed machines on Edge Hill were not at all exceptional for low-gearred machines,

that all Triumphs are alike, but though our experience of this make of machine is an extended one, we must give Mr. Brandish credit for having kept his machine in the finest possible riding tune. It is the first 3½ h.p. sidecar machine on which we have reached forty to forty-five miles an hour on the road by speedometer, and the only alteration in it from the standard was the fitting of a No. 38 jet. The timing of the engine and magneto is exactly as that sent out by the makers.

The Millford sidecar was not a light wicker affair, but from a rough calculation must have weighed 120 lbs. There was, naturally, great jubilation in the party present, which included Mrs. and the Misses Schulte, Mr. and Mrs. Hulbert, Messrs. Fulford, Howes, Armstrong, Newsome, Lloyd, and Cheshire.

The New Two-speed Triumph.

On the occasion of this outing we had the first road experience of the new two-speed Triumph and sidecar, the outcome of several years' experiments with change speed gears of all patterns. At present the machine is geared 5 and 8¼ to 1, the drive on top gear being direct, without any idle gears revolving. Using a standard engine (with experimental adjustable tappets), the machine made two clean ascents of Edge Hill with the low gear engaged for the major portion of the climb, but the performance was overshadowed by Mr. Brandish's achievement on the single-gearred machine. The Triumph gear is carried in a shell fitted in place of the usual pedal bracket, and is controlled by a rocking pedal similar to that used on the clutch machine. One movement of the lever engages the low gear, the other the high gear, the midway position giving a free engine. Except for mentioning that the big pulleys render the gear particularly kind to belts, we will refrain from further comment until the design is standardised.

Miss Lena Schulte, who is only fifteen years of age and had followed the performances with keen interest, could no longer suppress her sporting instincts, and begged permission to ride Newsome's free engine Triumph up Edge Hill. The machine made such light work of the gradient that her younger sister Muriel's demand for a ride on the back carrier was acceded to, and again Miss Lena dexterously drove the machine to the summit, no mean performance for a young lady.

Passing the danger board at the top of the 1 in 7 gradient.

and, further, that the numerous failures of motor bicycles to climb the hill must be due either to bad manipulation of the levers or to maladjustment of the machine. Hill-climbing, as every novice knows, is a question of gear ratio pure and simple, but, nevertheless, there are very few 3½ h.p. machines whose pulleys permit of a ratio low enough to render possible an ascent of 1 in 7 gradients with a passenger.

A happy little band assembled at Edge Hill to witness Mr. W. Brandish, of Great Heath, Coventry, make his ascent. He stopped to cool his 1911 Triumph at the foot of the hill, meanwhile reducing the gear ratio (which we afterwards measured) to 6½ to 1, and at the first essay he opened the eyes of the onlookers by topping the rise with Mr. W. H. Fulford as his passenger. Later in the afternoon he repeated the performance with one of our representatives in the sidecar, this being the third ascent, his second attempt having failed only forty yards from the top of the hill. After this most creditable performance, we had the sidecar and passengers weighed, and the total avoirdupois proved to be 656 lbs. Triumph riders who read of this performance may think there is nothing exceptional in Mr. Brandish's achievement, seeing

The party who assembled specially to witness W. Brandish's ascent of Edge Hill.

Variable Gears and Motor Cycles.

III.—EPICYCLIC GEARS.

IT will be remembered that in my last notes on this subject I divided variable gears into two main divisions, viz.: 1, clutches and friction devices; 2, variable gears properly so called. These are made in the following forms:

1. Epicyclic (three forms).
2. Sliding tooth.
3. Teeth in mesh, sliding clutch.
4. Selective clutch.
5. Expanding pulley.

I have placed epicyclic gears in the first place not because I think them the most suitable, but

Section of the two-speed hub gear, made under Roc patents with live axle.

because that type of gear was the first to be fitted to motor bicycles.

1. The epicyclic gear is made in three forms. In each form we find sun and planet wheels, but in the first form the third member is an internally-toothed wheel encircling the planet wheels. These epicyclic gears have proved very successful on ordinary pedal bicycles, and they can be made to give a large variety of gearing with only one train of wheels—more, in fact, than is required. If the sun wheel is the driver and the planets the driven members, there is a reduction of gear. With the sun wheel stationary and the planet wheels driven there is a less reduction. If the planets are the drivers an increase of gear is obtained—moderate with the sun wheel stationary, great when the sun wheel is driven. If the planet

wheels are kept stationary the movement will be reversed, and if the sun wheel is the driver there will be a reduction of gear, but with the sun wheel driven there will be an increase. In addition to these four forward and two reverse gears, the whole can be locked together to drive solid.

Large Number of Variations.

Thus seven gears can be got from a system of three wheels. Of course, a reverse is useless on a motor bicycle, though it might be desirable on a tricar or light runabout. There is no gear at present manufactured which gives all the five forward gears. It would be too complicated, and the variations would be too large. I mention all these just to show the capabilities of the system, which, put shortly, are as follow:

1. Planets driven—reduction.
2. Planets drivers—increase.
3. Planets stationary—reverse.

The difficulty in the manufacture of this gear lies in the hardening of the internally-toothed wheel, which is apt to warp in the process, and then requires to be ground true.

Examples of this gear are found in the Armstrong Three-speed and in the Ariel Lightweight. The latter gear follows very closely a patent taken out by the writer in 1903, and allowed to lapse owing to want of facilities for placing it on the market.

Principle of the epicyclic gear with spur wheels.

In the second form of epicyclic gear the planet wheels are made in pairs, rigidly fixed together, and the third member is an ordinary toothed wheel, placed beside the sun wheel and concentric with it, but not firmly fixed to the same axle. A single train of wheels will give two gears; the high gear is obtained by causing the whole to revolve as one solid piece, and the low by holding the gear box containing the planet wheels stationary by means of a friction band. The direct drive can, if desired, be made the low gear, but this is not the usual practice. This gear is more common than the first, as it is easier to manufacture, but it does not give so many variations; on the other hand, any desired variation can be made, and in this it has an advantage over the first form, in which the variations are limited.

The Fit-all crankshaft gears and the Millennium and Roc hub gears are made on this principle.

The third form of epicyclic gear is designed to make the planet wheels the driven members when the low gear is in operation, and the third member, concentric with the sun wheel (as at No. 2), is held stationary. This necessitates the use of two pairs of planet wheels in mesh with each other, the second wheel of the first pair engaging with the driver, and that of the second pair with the stationary wheel round which it rolls, carrying the gear box with it.

This method is used in the Rex and V.S. hub gears, and is quite satisfactory.

AURIGA.

(To be continued.)

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

An Endless Belt Dilemma.

[5972.]-"Ixion" has disappointed me. I asked for help, and he offers me — what? a tube of seccotine. However, a camel will clutch at straws if he is drowning on his back (have I got that quite right, it seems not quite familiar), so I suppose I must accept and use the hacksaw rather than submit to the alternative.

By the way, I am still "pausing for a reply," but I shall not compare "Ixion" to Brutus any more; he rather reminds me of General Bangs, "but that is another story."

FAUST.

Standardisation of Tyre Rims.

[5973.]-With reference to your correspondent's ("L E 219") letter concerning the round base rim, we cannot understand why English manufacturers will not adopt this rim. It is used almost exclusively by foreign manufacturers, including the Indian, and the colonials are insisting on having their machines so fitted. These facts themselves speak very highly. We herewith give you some of the advantages of this rim:

No projecting beads to become dented.

In building plenty of stagger may be employed which means a stronger and truer wheel.

Heavier metal may be, and is used, in the manufacture.

A very neat section which is easily cleaned and offers a good braking surface.

There is plenty of room for a large strong bead.

The beads are nicely rounded and do not cut the cover. Lower price.

What more can motor cycle manufacturers ask for? We think this is a matter for the Manufacturers' Union.

H. JAMES AND CO., LTD.

A. JAMES.

Twin Engines and Sooted Plugs.

[5974.]-It has been my object for some time to try to get to the bottom of the prejudice against the twin-cylinder machine. After making many enquiries and getting the opinion of every rider or owner of a "twin" I met, the chief argument against "twins" appears to be that the cylinders do not get an equal amount of oil, and the difficulty of giving sufficient and yet not too much lubricating oil.

If one gives the least bit too much oil the back cylinder is sure to soot up its plug in no time. Yet if one reduces the amount of oil by even a trifle then a seizure of front cylinder is imminent. Personally, I had to discard a quite new machine of 7 h.p. for this reason only. I verily believe that on a hilly road I took the back plug out about every third or fourth mile and cleaned it, and noticed when it was out an excess of oil in the combustion chamber and on valve seat. I reduced the amount of oil, with the result that my front cylinder partly seized when near the top of a not too stiff short hill.

I went back to the single and have never taken plug out since I have had it, and had not the slightest trouble in any shape. When I can get a "twin" that the makers will absolutely guarantee to be free from the defect I speak of I shall try again.

WOULD-BE TWIN.

[The trouble complained of can be and is overcome to a great extent by altering the position of the sparking plugs. On top and in centre of the combustion head is usually found to be the best position. If the plugs are so situated that they catch the oil flung from the corner of the piston they will quickly soot up.—ED.]

Saddle or Seat?

[5975.]-How is it that motor cycle manufacturers cling so tenaciously to the old push bicycle type of saddle? Were these saddles not originally designed to give free movement to the legs for pedalling, and as pedals are now practically obsolete, or ought to be, on any powerful machine, why on earth do they not give us something comfortable to sit upon?

Nearly every 1912 touring machine will have a free engine, so there seems no valid reason why we cannot be supplied with a miniature bucket seat with back rest in one piece, well sprung, and no economy to be exercised in the padding. It seems to me that a big number of the trade are devoting all their time and attention to getting a mile or two more per hour out of their engines, and neglecting the comfort of the rider altogether.

COMFORT.

A Suggested Form of Footrests.

[5976.]-I enclose sketches of a supplementary footrest which I have designed and had fitted to my two-speed Douglas. A is the original footrest; B the extra rests, which are made of wood, rubber covered; C is the rod which

actuates the two-speed gear. I find these footrests make very comfortable rests for the heels, and also give a change of position which is often welcome. It is in the hope that some of your readers may be benefited that I send the drawings, which show the rests in plan and elevation, also a side view.

(REV.) W. A. DOUGLAS-HAMILTON.

Sidecars and Change-speed Gears.

[5977.]-I should like to give some experiences of a Triumph with Millennium hub gear and Chater-Lea sidecar.

I live in probably the most hilly part of England (West Riding), and most of my touring is done in these parts and in the Lake District. Hills, very long and steep hills, abound, the first rise on the way to the Lakes being about threequarters of a mile with stretches of 1 in 6, or worse. For some time I used it with fixed gear and no free engine. This required a very active passenger (and I had one) and considerable l.p.a. (falsely so-called). This form of travelling was vastly amusing, but hard work. On a long steep hill, like Dunmail, this sort of thing happened—Vigorous l.p.a., then the passenger hopped off, later I slid off and ran till the pace became too terrific, on again, and off, and so on.

If there was a head wind it was still more exciting. Our method of starting seemed to amuse people in Ambleside. We both pushed till things got going, and then took flying leaps into our appointed places, enquiring, on arrival, "Are you there?" So I got a two-speed gear fitted. This was a great improvement. Starting was more sedate, and I could and did get practically anywhere, but it is necessary to keep the engine well in tune.

A point which seems to have been overlooked occurs to me. Is it fair on the machine to overwork it so? The frame is not built for such strains, and the engine is being run with a very liberal throttle opening. For ordinary country it does very well, but for this sort I feel that more power is desirable for real pleasure. Personally, I am going in for a Chater-Lea No. 7, and may give my experiences with it later.

I note that in letter No. 5937 Mr. Lake sighs for the Gradua gear. I believe the Zenith Co. make special fittings for Triumphs. WEST RIDING.

[5978.]-I quite agree with everything "Perplexed" says in his letter [5911] on above subject. A "3½" with two-speed gear may do all right with sidecar in England, where the roads are mostly level and in many districts having a fine tarred surface, but for the North of Scotland it is utterly out of the question.

I grant you that it could be humoured up ordinary hills and would pull all right on the level if the engine is cleaned out every 500 miles or so and kept otherwise in perfect tune. But who is to be bothered with an engine that has to be coaxed up stiffish hills, many of which are met immediately after rounding a sharp turn, which must be negotiated slowly on account of the narrow roads, etc.

My ideal machine would be of 5-6 h.p. with variable gear and chain-drive (enclosed). The 6 h.p. Zenith is undoubtedly the machine had it chain drive, but this is out of the question with the Gradua gear. I have no doubt an inch Whittle would give every satisfaction in dry weather, but I am afraid an unprotected belt has yet to be invented which will stand a day of rain and filthy roads on a 6 h.p. passenger machine without slipping, and once the slipping commences you might have sixty horse-power instead of six and be no better off.

I think most motor cyclists who are not biased in favour of any particular machine and who have had an acquaintance with the high roads and bye-roads in the North of Scotland will agree that the power I mention is necessary, assuming the passengers weigh, say, from twenty-two to twenty-seven stones, and assuming also that all the necessary luggage for both parties is carried throughout a holiday tour. C.F.

[5979.]-Having been a satisfied user of the N.S.U. gear for over four years, I can quite endorse the opinion of Mr. Jas. T. G. Philips as to the good points of the gear. Some of Mr. Philips's remarks, however, I cannot quite understand. Why does he have to take his gear to pieces to oil it? In both of the gears I have had, and all the others I have known, there has been a screw provided for the purpose of injecting oil. With an oil gun quite thick oil can be put in, and the whole job can be done inside five minutes.

The first N.S.U. gear I had I fitted to three different machines (not N.S.U.'s), so that it was necessary to oil the gear from the outside. My present machine is a 6 h.p. twin N.S.U., and owing to the drilled crankshaft no oiling of the gear is required; it automatically oils itself. At least my machine has so far run just over 3,000 miles and I've had no occasion to oil it from outside yet.

With regard to Mr. Philips's list of faults, I agree with No. 1, but the obvious remedy is not to over-oil. If Mr. Philips takes his gear to pieces every time to oil up, no doubt he is inclined to overdo it. Oiling by the small screw provided, No. 1 trouble is got over. No. 2 is perfectly natural, but is not every clutch so affected? Again the remedy is obvious. I used to suffer from trouble No. 3, but have now got the knack of holding the gear handle in low gear position with my knee. No. 4 is simple to remedy—fit a stronger clutch spring (cost 9d.). I only renewed my clutch spring once in three years on my old gear, and could never make it slip on top. Trouble No. 5 I have not so far experienced, but believe Mr. Philips to be correct.

I am in no way connected with the N.S.U. company, but can recommend their gear. H. J. M. HUGHES.

Passenger Carrying on a Lightweight.

[5980.]-In reply to the letters re experience with sidecar machines and hill-climbing capabilities generally, I have found the same trouble as "Perplexed." After having two triars I invested in a 3½ h.p. Brown, on which I covered over 4,000 miles of very enjoyable riding with a fixed gear of 5½ to 1. Longing for a go-anywhere machine, my next mount was a 4 h.p. —, which I imagined with its two-speed gear would do anything, but I was quickly disappointed, as it developed very little power, and of this most was absorbed by the low gear on any hill; this I verified later by an actual brake test.

This season I have been doing very little sidecar work but a great deal of solo, and often pillion carrying with a 2½ h.p. A.J.S. The accompanying photograph will show that the passenger faces the oncoming traffic, the carrier strengthened with two extra stays, a padded spring cushion, rubber-covered footboard, and a well-pumped back tyre makes this very enjoyable. I slip the saddle three inches forward, so as to distribute the weight better, before starting for a long ride. So far I have done nearly two

Basil Adams, the writer of letter No. 5980., and his 2½ h.p. A.J.S. with pillion seat.

thousand miles. My longest rides are: Through the Wye Valley, 110 miles; Ilfracombe via Barnstaple, 116 miles. Each was done between 3 and 10 p.m. on Saturdays.

With Ilfracombe as a centre, I have been to Lynton, Hunters' Inn, Braunton, Lee, and various other rides, also many places on Dartmoor. Each district abounds with hills, but the machine will tackle anything up to 1 in 8 even with a passenger. I have not yet found a hill that will stop it, whereas around Bristol one can go anywhere within a fifty-mile radius.

The chain drive fulfils my idea of the ideal transmission; I have renewed my front chain, but my original back chain is still in place, and that after nearly 10,000 miles.

I do not know yet what the inside of my clutch or gear box is like, as I have never had a squeak from either, and cannot detect any more noise on low gear than on high.

A reliable two-speed gear is the most necessary thing on a sidecar combination, also the clutch controlled from the handle-bar, as then one is able to help the machine when starting on a hill. From my experience of the 3½ h.p. P. and M., it is the machine for sidecar work if one will not try a twin, and if the passenger will walk up patches of loose 1 in 6 gradient or steeper, then one can go practically over any road with it. BASIL ADAMS.

Single-cylinder Records.

[5981.]-We are somewhat surprised at Mr. Arthur M. C. Scott's query in last week's issue of *The Motor Cycle* in regard to Indian motor cycles, what they are going to do, what they have done, etc., in view of the fact that Mr. Arthur M. C. Scott was quite recently in our employ and

should have been fairly well posted on the doings of Indians in general.

As you have not essayed to answer Mr. Scott's queries we would like to suggest to him that he can get all the information he desires at any time by calling at our depot in Great Portland Street.

THE HENDEE MANUFACTURING COMPANY.

Ladies and the Motor Cycle.

[5982.]-I am sending two photographs which I think will prove interesting to your readers, as showing the progress motor cycling is making among the ladies in the Midlands. The group shows Miss Lottie Berend (centre)—this lady is well known to you—on the left is Miss Walmsley, of Derby, and on the right is myself. All the machines are $3\frac{1}{2}$ h.p. Brough ladies' models. Miss Berend's and my own are the standard free engine type. Miss Walmsley has a two-speed gear, as she habitually uses a sidecar.

I have toured this season close on 3,000 miles, and have not once been hung up for any cause otherwise than the inevitable puncture. Hills with my $3\frac{1}{2}$ Brough are of no moment. In my last tour to Bettws-y-Coed, with my husband, who rides a $3\frac{1}{2}$ h.p. Singer, I was enabled to take all the hills at well over the legal speed limit. This is where some reserve power comes in handy. The sensation of touching a lever and rushing up steep gradients is delightful.

I am really at a loss to understand why more ladies do not take up this invigorating and health-giving pastime. Is it because they are afraid they will not look smart enough on a motor cycle, or on account of its apparent complications? If the latter, I can assure the waverers they need have no fear, and after having had a few lessons they will be astonished how easily a motor cycle is managed. I myself have ridden one three seasons, and hope to do so many more.

In conclusion, I should really like to say a word of praise for my $3\frac{1}{2}$ Brough, but must add the usual, that I am not in any way interested in the makers of this machine, only as a satisfied customer. It is a splendid machine and nicely designed for a lady's purpose. On my next one, however, I shall have a two-speed as well as the free engine.

(Mrs.) S. DAVIS.

Modifying an Old Carburetter.

[5983.]-*Apropos* of the question of slow running, straight-through carburetters, and adjustable choke tubes, so much in evidence at the present moment in your columns, I thought, perhaps, that a modification of a Longuemare carburetter, which I am using on a $4\frac{1}{2}$ h.p. water-cooled Stevens-engined tricar, might be of interest to your readers, as it combines the three desiderata mentioned above.

Illustrating the alterations to a Longuemare carburetter, as described in letter No. 5983.

In spite of an extra air port in the inlet pipe, in addition to the usual two extra air slots in the annular ring above the jet, I could not give the engine enough air unless I fitted a smaller jet than a ten-slot. If I fitted a larger choke tube it was difficult to start the engine. Neither could I keep the mixture constant, and this I attributed to the fact that I had three streams of pure air coming into the mixture on its way to the engine, thus making the charge "streaky."

To do away with this, I fitted an adjustable choke tube and closed up the three extra air ports above the jet. I

Ladies are slowly accepting the motor cycle as an ideal form of transport. This above picture was taken in the Midlands recently. (See letter No. 5982.)

removed the standard choke tube and fitted a liner A of tin to the barrel of the carburetter. In this was soldered an annular ring of tin B, having eight holes arranged equidistant round its centre. I next cut eight crescents of ferrotype plate, C, C₁, C₂, etc., on the reverse sides and ends of which were soldered small pins about $\frac{1}{16}$ in. long. These were arranged on the ring B with the pins through the holes, which formed the pivots on which the crescents swing. A thick washer D was then cut with eight slots, into which the top pins on the plates were fitted. On the ring D two arms E-E, projected up into the inlet pipe, and these were slotted to receive a wire F passing through the ring H, the previous extra air holes in which were stopped up. A cone-shaped liner K was then soldered in to guide the air past the jet.

On rotating the ring D, each crescent-shaped segment was swung across towards the jet, thus closing up the space between M and N. I thus get a straight-through multiple jet carburetter, all the air coming past the jet and getting thoroughly saturated with the petrol. I can now throttle the engine down to a small quantity of rich mixture for slow running, and also have a large choke for full throttle.

I have been using this adapter for five or six months, and I find the engine is easier to start, more powerful, and does not race when started on the handle.

From an economical point of view I cannot give any particulars, as I have not kept any record of the mileage per gallon, the cost of petrol, in my opinion, being one of the smallest items in the cost of upkeep.

The back tyre is the *bête noire* of a tricar owner, and if any reader can put me on a 28in. x 2½in. tyre which will give more than 1,000 miles on the back wheel I should be glad.

The drawings are not to scale, being done from memory.

ALEX. F. PAYNE.

[A NUMBER OF INTERESTING LETTERS ARE UN-AVOIDABLY HELD OVER.—Ed.]

The Last Quarterly Trial of 1911.

Only Twelve accomplish Non-stops in the A.C.U. Midland Centre Contest.

W. B. Gibb (2nd Imp. Douglas) and A. H. Lowe (A.C. sociable) at the second and worst bend on Farlow Bank.

THE fourth and last of the 1911 series of Quarterly Trials organised by the Auto Cycle Union was held on Saturday in the Midlands. Competitors were started from the outskirts of Birmingham soon after 8.30 a.m. over a course measuring 167 miles. The destination of the Aggregate Cup for the best performance in the four trials was decided by this contest, and more than ordinary interest was occasioned thereby. Only two of the fifty-one entrants failed to put in an appearance at the start from the King's Head Hotel, Hagley Road, Birmingham, these being C. E. Shepherd (3½ A.S.L.) and H. J. Beal (3 N.S.U.). Mr. C. A. Smith officiated as starter, and meanwhile the other officials and timekeepers scurried ahead to take up their positions at Farlow Bank, the first of the two test hills.

A thick mist prevailed at the start. All got away well, except V. Busby (Humber), who had to stop and flood his carburettor a second time. The route lay through Halesowen and Hagley to Kidderminster. Here the local police pointed the way, which consisted of a series of right angled turns in narrow streets. On to Bewdley and Bagginswood nothing of note occurred, but here Silver broke a belt fastener.

There was nothing to indicate that competitors were approaching Farlow Bank—except the excellent route cards, thanks to the organisation of Mr. H. C. Pickering—but following the direction of the arrows, competitors were sent off the main roads over gulleys and lumpy surfaces, wending their way along a narrow and tortuous lane to the foot of the Bank.

The Failures on Farlow Bank.

Riding with the competitors the first notification we had that Farlow was near at hand was the sight of a big group of cars and motor cycles which had conveyed spectators to the hill from far and near, then W. Cooper looking disconsolate as he descended the hill for a second try. There are three awkward bends on Farlow Bank, one to the right, then a very steep pitch, an easier stretch, succeeded by a left hand hairpin which would place in the background the bad bend on Snaefell, even were the surface not soft loose gravel, for all the world like a garden after it has been dug up. One is confronted with a gradient of 1 in 5 on the bend and for fifty yards after rounding the bend, when the gradient eases a trifle, and there is a final twist to the right.

Several hundred spectators had assembled at the hairpin in the anticipation of seeing some fun, and they were not disappointed, for in contra-distinction to the usual order of motor cycle hill tests there were a good many more failures than successes, and the crowd was a thoroughly merry one which did not hesitate to pass remarks. Sometimes a competitor in his hurried movements to prevent the machine running backwards on the steep gradient would execute some weird antics which seemed to amuse the crowd, but not so the crestfallen competitor, who, when he could sufficiently recover himself, would turn with very black looks in the direction whence the laughter came. Nearly all the failures occurred at the corner. The successful competitors—and there were only sixteen to make clean ascents of Farlow Bank—were readily applauded, and the crowd cheered

Farlow Bank. - J. W. Woodgate (two-speed Singer) at the point where most competitors failed. Observe the fallen machines by the roadside.

lustily as Miss Nellie Hough, on the two-speed Douglas, picking her way coolly on the outer curve of the bend, made the cleanest and neatest ascent of the whole lot. Farlow Bank is a trick hill, and many consider that the A.C.U. went too far in selecting such a test, which is on a by-lane. W. B. Gibb, a competition rider of considerable experience, told us that he knew only one bend like it, and that was on the Scottish terror, Cairn-o'-Mount. Others likened it to Porlock in Devonshire. However, those who did accomplish the climb are deserving of every credit.

The two little A.J.S. machines surprised everybody and sailed up without a murmur, although J. Stevens, we are told, had never seen the hill before. The trio of Rudge riders—Burney, Hill and Gray—ascended the hill in a

cluster, and must have hindered each other. Gray stopped at the very top of the steep section, whilst his *confrères* were successful, though Hill's back wheel slithered into the ditch and nearly brought he and Burney over. The P. and M.'s—Merrall and Brancaster up—seemed in their element, and Newman, using a new Brampton gear on his Ivy-Precision, made no mistake. Busby (Humber) and South (Scott) used their feet in rounding the bend, but otherwise made very good ascents. The passenger machines found it a tough task, Frank Smith's exhibition on the Clyno being the neatest. Ware travelled well on his Chater-Lea, and would have done better had the back wheel gripped on the loose surface. During the ascents a taxicab came up the hill and stuck after rounding the bend. A sore of willing hands helped it to move to a place of safety. A number of competitors ascribed their failures to being baulked. Woodgate on the new counter-shaft gear Singer experienced very hard luck, for he had surmounted the steepest stretch when his back wheel skidded into the ditch, bringing him over. Dr. Basil Fawcett had climbed the Bank several times on his 8 h.p. Chater-Lea and Lowen sidecar, but he chose to take Mrs. Fawcett and their little boy round the Quaterly Trials, and the extra weight just accounted for his failure on Farlow and Birdlip. The Morgan runabout was probably the fastest passenger machine. The names of those who came to a standstill are given in our tabulated list of results.

Incidents of the Trial.

Leaving Farlow, with its long black list, the route lay through Ludlow, Ludford, Burford, Tenbury, to Kyre, Colington, and Bromyard. The road surface improved considerably. The twisty route through Bromyard was well marked, and here, as in most other towns passed through, small crowds assembled at street corners to watch the riders file through. After Bromyard, we encountered R. H. Viggers (Enfield) with a burst front tyre. This rider charged the bank on Farlow owing to his back wheel spinning round, and must have dented the rim, for the cover blew off, the machine finally finishing in the hedge by the roadside. P. Brewster, who made three futile attempts to climb Farlow on a single gear, ran out of petrol and retired.

Ankerdine Hill, not being mentioned on the route card, proved a big surprise, and though only two failed—G. Lee Temple (single-gear Arno) and H. C. Glover (2½ h.p. Forward), whose machine was not running in tip-top form—several competitors had anxious faces before they reached the top.

The leaders on the road from Knightsford Bridge.

Alec Ross restarting T. Silver (Quadrant) from the Star Hotel, Worcester. B. A. Hill (Rudge) may be recognised in the background.

Worcester was reached *via* Martley. An excellent lunch was served at the Star Hotel, and in an hour competitors were on their way again.

The roads after lunch were very good, albeit dusty. There was nothing of note to chronicle on the section Tewkesbury-Norton-Gloucester, where competitors prepared for Birdlip, the second test hill.

Observations at Birdlip.

This well-known Gloucestershire hill, which lies on the direct road from Gloucester to Cirencester, provided a most excellent test for the trials competitors. We found a goodly number of keen spectators, motor cyclists, and car owners on arrival at the hill. The surface was in excellent condition owing to the rain which had fallen on the previous day. Taking up our position just below the last steep bit of 1 in 6, we obtained an excellent view of the riders as they passed "The Knap" far below. This house is situated close to the severest gradient on the hill—1 in 5½. The first motor cyclist to ascend was Mrs. Gibb, of Gloucester. She was not competing in the trial, but rode up excellently on her two-speed Douglas. Soon after she had passed several

non-competitors formed a sort of advance guard, and we noticed among others a James, a Rover, a P. and M., and six single-gear Triumphs, all of which passed us going well. It should, however, be noted that these riders were at liberty to cool their engines at the hill foot.

V. Busby (2½ Humber), whose machine was entered by H. Garner, Ltd., led the vanguard, and using the low gear of his Armstrong made an excellent climb on the last portion of the hill. When observing on a long hill like Birdlip it is extremely difficult to point to any individual performances as more noteworthy than others, because one rider may be travelling well at the foot and badly at the top, and *vice versa*; everyone, however, agreed that W. D. South (3½ Scott), H. D. Jones (3½ Zenith-Gradua), and Miss N. Hough (2½ Douglas), among others, made excellent climbs. Owing to trouble with the official car carrying the timekeepers, no times could be taken. E. B. Ware (Chater Lea) and Frank Smith (5-6 Clyno) did well as usual among the passenger machines, and the performance of the Morgan runabout was very much admired. The three A.C. Sociables all made good ascents, F. E. Walker (5-6 A.C. Sociable) gaining rapidly on Fred Hill, who drove a similar machine. J. Tassell's Matchless and sidecar proved as good on Birdlip as it did on the Yorkshire hills in the 1,000 miles trials, and it was a matter of considerable satisfaction to all concerned to see passenger combinations performing in such an excellent manner on this severe gradient.

Dropping down Leckhampton, a circuitous route was followed in order to avoid Cheltenham. Cleeve Hill was ascended without difficulty by all. In Winchcombe a dog made a dash for E. W. Merrill, who kicked out with his

Nearing Tewkesbury. W. Cooper (3½ Bradbury), accompanied by F. A. McNab (3½ Trump-Jap), who was a non-competitor.

foot, and the little terror unfortunately retreated under Miss Hough's machine, and brought that clever rider over. She was only shaken, however, and continued, her experience counting as a traffic stop. Later, we passed Southam (Zenith) fitting a new inner tube, and Duke (Zenith) refitting a valve and repairing a puncture.

After passing through Evesham, Dunnington, and Astwood Bank, a halt was called at Headless Cross for the purpose of lighting lamps. The fog came on rather thickly towards the finishing point, which was reached *via* Bromsgrove, Romsley, and Halesowen.

All those with three previous non-stops in the running for the aggregate cup duly completed Saturday's fourth and last event except Ware, who is to be heartily sympathised with. A front wheel puncture, the sole trouble in four consecutive trials, speaks as well for the regular running of the Chater-Lea as it does for the skill of the driver. The Stevens brothers (A.J.S.) again non-stopped, likewise Burney and Hill (Rudge) and F. Smith (Clyno). The New Hudson riders were notable omissions from the non-stop list. They have to thank the A.C.U. for the selection of Farlow Bank for spoiling their run of successes. H. F. S. Morgan again shone conspicuously.

H. J. Cox (an official), J. W. Woodhouse (Dene-Precision), and W. D. South (Scott), at the compulsory stop at Headless Cross, for the purpose of lighting lamps. The photograph was taken in the dusk.

The RUDGE

beats every other
Motor Cycle in the
4 A.C.U. Quarterly
Trials during 1911,
winning the SILVER
CUP for the best aggregate performance.

The machine accomplishing this remarkable performance was
a Standard Model ridden by B. Alan Hill.

RETIREMENTS.—P. Brewster (3½ Norton), A. M. Lomax (3½ B.S.A.), W. R. Jones (4½ Ixion-Precision), *H. C. Glover (2½ Forward), and *S. Kempson Jones (3½ L.M.C. and sidecar).

Only twelve out of forty-nine competitors climbed the two test hills and made non-stop runs, a percentage of 24.5.

Ruling out the failures on Farlow Bank, the non-stop list would have been increased to twenty-seven = 55.10%.

Did the A.C.U. go too far in selecting a freak hill on a by-road as a test gradient? A great many spectators thought so on Saturday.

No single-gear machine climbed Farlow last Saturday, although it has been climbed many times previously. Brewster (Norton) and Temple (Arno) were several times successful in practice.

It is a strange fact that several riders who claim to have climbed Farlow at the first attempt failed ignominiously.

We heard of several competitors who had climbed Farlow at nearly every attempt in practice and returned home satisfied, only to fail in Saturday's event.

There had been a great deal of practising during last week. R. H. Viggers climbed the hill twenty-seven times out of thirty attempts on his Enfield. T. Silver never had any trouble in reaching the summit on his three-speed Quadrant.

G. T. Gray made nine clean ascents on his Rudge, F. S. Whitworth considered it an ordinary performance for his Douglas, Manning-Lomax had hitherto encountered nothing which could stop his B.S.A. with the new pattern B.S.A. hub two-speed gear, and Dixon and Bell had given their 1912 New Hudsons an exhaustive test, yet on the all-important trial all the above stopped. Was it due to the excitable crowd or to the hot engines?

Farlow Bank was the *pièce de résistance*. Birdlip sank into oblivion compared with the first test hill, and a number of non-competitors on standard single-gear machines climbed the one time Gloucestershire terror with ease.

On Saturday evening Mr. A. Melano, of the Hutchinson Tyre Co., presented the A.C.U. with a silver cup to be awarded for the best performance in this year's trials on a lightweight. One of the Stevens, on the A.J.S., is bound to receive it, as these two brothers have made non-stop runs and gained first-class certificates in each of the four events—a most creditable performance.

Troubles were exceedingly few on Saturday; in fact, never do we recollect such an absence of roadside repairs. If we eliminate tyre troubles and hill failures, the number of stoppages could be counted on one's fingers.

THE AUTO CYCLE UNION'S OCTOBER QUARTERLY TRIALS.

JUDGES' REPORT.

B. Alan Hill (Rudge) declared Winner of the "Aggregate" Cup.

THE fourth Quarterly Trial of motor cycles was held on the 14th inst. The distance covered was 167 miles, and included two severe hill tests in Farlow Bank, Worcestershire, and Birdlip Hill, Gloucestershire.

The weather was dull and misty, with no rain; the roads were in good condition, with the exception of Farlow Bank, on which the surface was loose.

Forty-two single and nine passenger machines entered. Of the single machines, three had engines not exceeding 300 c.c. capacity, seven had engines of capacity between 300 and 343 c.c., while the single-cylinder engine of the greatest capacity was the Norton, with 636 c.c. There were only two non-starters.

Only two single-gear machines ventured to enter. Three new speed gears made their first appearance in the Trials, the Bowden, the B.S.A., and the Singer, in which the crank case and gear box are combined in one casting; while the Brampton gear appeared in a new form. Of the passenger machines five were sidecars and four sociables. The Chater-Lea sidecar entered by E. B. Ware had a neat gear case and covers fitted over the valve tappets. The Clyno sidecar had the axle of the sidecar wheel supported by an outside member of the frame, while the attachment of the sidecar to the front of

the machine was by a pair of braced members instead of by the usual single tube. The Morgan runabout had further improvements in a bonnet over the engine and a metal shield for the magneto.

It will be seen, by reference to the tabulated results, that twelve machines made non-stop runs; of these three were passenger machines. The passenger machines on the whole, therefore, made a better show (five non-stops out of nine starters) than the singles (nine non-stops out of forty starters). The two hills account for most of the failures. Birdlip has long been known (by repute if not by actual acquaintance) to motor cyclists; it may be described as long, straight and steep. Compared with Birdlip, Farlow Bank is shorter, steeper, and has two sharp bends on the steep gradient. The twelve non-stop runs are divided between eleven different types of speed gears, the A.J.S. being the only gear to secure two non-stops. Miss Hough, on a 2½ h.p. two-speed Douglas, is to be specially congratulated on having succeeded where so many older and more experienced riders have failed.

The general failure of the bicycles to climb Farlow is, probably, due to the gears not being set low enough. A three-speed mechanism, with the high gear as

the normal and giving two reductions of speed, would seem to be better for such a trial as Farlow Bank than one with the middle gear as normal, giving only one reduction.

The official car with the judges and timekeepers had much tyre trouble, so that it arrived a trifle late at Farlow Bank and did not reach Birdlip Hill at all. There was, therefore, no timing on the hills.

The Aggregate Cup.

As a result of the four trials there are left three competitors who have each obtained four first-class certificates. These are: J. Stevens (2½ h.p. A.J.S.), B. Alan Hill (3½ h.p. Rudge), and Frank Smith (5-6 h.p. Clyno and sidecar).

As will be seen from the judges' report, there was no timing on the hills in the October trial; the award has, therefore, to be made on the results of the three previous trials. The deviations from standard time on the six hills are respectively:

B. Alan Hill	...	85½s.
F. Smith	...	109½s.
J. Stevens	...	136½s.

B. Alan Hill is, therefore, awarded the special silver cup.

Judges { DOUGLAS K. HALL.
ARCHIBALD SHARP.

HERTS. COUNTY A.C. MEMBERS' HILL-CLIMB.

A very successful members' hill-climb was held on Saturday last at Aston Clinton Hill. J. T. Bashall on his big Bat-Jap made fastest time of the day. In Class VI. also he came up the first bad pitch at such a speed that he took the grass at the first corner. However, he made an excellent recovery. The results are tabulated hereunder:

Time.	Formula.
Barnes (2½ Zenith)	Barnes (2½ Zenith)
	Tessier (2½ Bat)
	Bennett (2½ Grandex)
CLASS II.	
Colver (2½ Enfield)	W. H. Bashall (2½ Humber)83
	Colver (2½ Enfield)84
CLASS III.	
E. A. Colliver (3½ Zenith)	Barnes (2½ Zenith)53
	Tessier (2½ Bat)63
	A. J. Dixon (3½ Rudge)77
CLASS IV.	
C. C. Cooke (3½ Triumph)	Barnes (2½ Zenith)54
H. Lister Cooper (3½ Triumph)	Colver (2½ Enfield)812
	Lister Cooper (Triumph)
	E. A. Colliver (Zenith)83
CLASS V.	
J. T. Bashall (7-8 Bat-Jap)	Down (2½ Enfield)91
	Barnes (6 Zenith)1.01
	J. T. Bashall (7-8 Bat-Jap)1.29
CLASS VI.	
J. T. Bashall (7-8 Bat-Jap)	Colver (2½ Enfield)7684
	Down (2½ Enfield)7692
	W. H. Bashall (2½ Humber)82
CLASS VII. Fastest time.

An Assumed Name in the Quarterly Trial.

H. Brancaster, who unfortunately lost his first class certificate in the Quarterly Trial owing to accidentally running off the route, is none other than Mr. Vincent Clive, who took the hero's part as the Earl of Brancaster in the great Drury Lane drama last year, "The Whip."

Stockport Hill-climb.

The Stockport M.C.C. held a hill-climb last week-end, fastest time being made by H. Marsden (5 h.p. Matchless-Jap), J. Whyte (3½ h.p. Triumph) being the fastest single-cylinder rider. The passenger class was won by J. Emmerson (5 h.p. M.S.L.).

The 3,000 Miles Engine Test.

Last week we referred to D. R. O'Donovan's achievement of riding 3,000 miles on a 3½ h.p. clutch model Singer with the valve caps, engine and hubs sealed. Mr. Donovan's method of checking was by obtaining signatures at the different towns through which he passed. He left with us his checking book for the purpose of examining the signatures, and we find that they number no less than 138. At the conclusion of the trial the cylinder was removed to prove to our satisfaction that the engine was of standard construction, and the interior was found to be in splendid condition. Mr. O'Donovan covered 1,000 miles in one week of the trial, and further climbed Birdlip with a 4½ to 1 gear. The clutch was one of the parts sealed, and it gave no trouble at all.

Dangerous Gates in Leamington Spa.

Readers will remember the serious accident which occurred to F. C. Wood recently. In reply to a letter to the Town Clerk of Leamington Spa suggesting that the dark iron palings with which Mr. Wood collided should be painted white so as to show up in the dark, Mr. G. Smith, hon. secretary of the Coventry and Warwickshire M.C., has received the following courteous letter: "Your letter of the 29th ult., with reference to the recent regrettable accident at the entrance to Victoria Park from Avenue Road, came before the Watch Committee at their last meeting, when, after inspection, it has been decided to paint the gates, posts, palisades, and notice boards at both the Archery Road and Avenue Road entrances in white paint, which it is hoped will prevent any similar accident occurring in future.—(Signed) LEO RAWLINSON, Town Clerk, Leamington Spa."

The Future of the T.T.

Will the Tourist Trophy Race be held in the Isle of Man next year or on Brooklands is a question which is engaging the serious attention of manufacturers at the present time. We refer readers to the leaderette in this issue.

The B.S.A. and the C.A.P.

We learned from an authoritative source on Saturday that the B.S.A. Co. had taken over the manufacture and control of the C.A.P. carburetter which has made such headway in its comparatively short existence.

A Trial of the 1912 Premier.

Last week-end we accompanied the competitors in the Quarterly Trial, covering in all nearly 250 miles, on a 1912 model three-speed Premier. The machine is fast, comfortable to ride, and did not require the tool bag opening. It climbed all hills with ease excepting Farlow Bank, but we do not doubt the machine's ability to account for that tricky ascent. After scraping round the hairpin bend as best we could we were not prepared for a gradient like the roof of a house, and consequently followed the example of a great many of the competitors.

SPECIAL FEATURES.

QUARTERLY TRIALS.

Official awards and Judges' report.

NEXT YEAR'S COMPETITIONS.

1912 MODELS.

Analysis of the Quarterly Trial Machines.

Of the twelve machines credited with non-stops in Saturday's trial seven had chain drive, one employed both belt and chain, the others had belt drive. Seven had two-speed gears, two three speeds, one four speeds, and two infinitely variable gears.

Italian Hill-climb.

The results of the Perugia hill-climb are to hand. The hill is five miles in length. The competition was divided into three classes for motor cycles not exceeding 250 c.c., 333 c.c., and 500 c.c. The winner of Class 1 rode a S.I.A.M.T., the second a Motosacoche, the third a S.I.A.M.T. Class 2 results were, 1st, 2nd, and 3rd, all on S.I.A.M.T.'s, and Class 3, 1st twin-cylinder S.I.A.M.T., 2nd Triumph, 3rd single-cylinder Borgo. Fastest time in Class 3 was 6m. 2s., which equals a speed of 49.7 m.p.h.

THE AUTUMN QUARTERLY TRIAL.

H. F. S. Morgan (new design runabout), who climbed both test hills with comparative ease, at the last bend on Farlow.

STOCKPORT AND DISTRICT M.C.C. HILL CLIMB.

Clever corner work on the part of J. Emmerson (5 h.p. M.S.L.), winner of the passenger class.

Acquitted.

James Merton who was committed for trial on the charge of obtaining a motor cycle value £25 by false pretences from G. N. Higgs has been acquitted. The jury stopped the case, returning a verdict of "Not Guilty."

[The case was first referred to in our issue of September 28th last, page 1017.]

Liverpool A.C.C. Two Days' Trial.

The official results of the above reliability trial in North Wales are as follows: Maximum number of marks obtainable, 1,000. First prize, silver cup and gold medal, W. Heaton (2½ h.p. two-speed A.J.S.), 980 marks; second prize and club gold medal, for the best performance on a fixed geared machine, T. Carroll (3½ h.p. Bradbury), 895 marks; third, club silver medal, George Wray (3½ h.p. Bradbury), fixed gear, 876 marks; fourth, bronze medal, N. Brown (3½ h.p. Rudge), 875 marks; Rex cigarette case, E. F. Baxter (7 h.p. Rex), 814 marks; club sidecar prize, A. Kirby (6 h.p. Zenith-Gradua and sidecar), 782 marks.

M.P. Frustrates Highway Robbery.

The Derbyshire police are investigating an attempt at highway robbery which, it is reported, was only frustrated by the timely arrival of Sir Herbert H. Raphael, M.P. It appears

FUTURE EVENTS

Oct. 21.—Herts County A.C. Autumn Open Speed Trials in Luton Hoo Park.

Dec. 27—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

that Mr. E. Innes, of Derby, while returning home from Burton-on-Trent on a motor cycle at night, was set upon by two men, who knocked him into the hedge and attempted to rifle his pockets.

He called out for help to a motor car, in which Sir Herbert Raphael was passing, and the men ran away as Sir Herbert went to Mr. Innes's rescue. Mr. Innes's knee had been badly cut and his clothing torn in the struggle.

Saturday's Speed Trials.

A wire from Mr. C. C. Cooke, hon. secretary of the Herts County A.C. (Motor Cycle Section) announces that there are over 100 entries for that club's speed trials in Luton Hoo Park.

A.C.U. Council Meeting.

The principal item on the agenda of the A.C.U. Council Meeting, which was held at the Imperial Hotel, Birmingham, on Friday evening last, was a motion which stood in the name of Mr. Vernon C. Brook (Birmingham M.C.C.). The following clubs were represented: North-west London, Coventry and Warwickshire, Birmingham, Stockport, Oxford, R.A.C., A.C.U. (private members), Sutton Coldfield, Gloucester City, Bradford, and Chesterfield. Mr. Victor Hart occupied the chair, and among those present were Messrs. C. A. Smith (hon. treasurer), H. E. Nisbet, D. K. Hall, Vernon Brook, R. W. Duke, H. C. Pickering, E. W. Winckle, A. Sharp, F. Straight (secretary). After the report had been duly passed Mr. Vernon Brook moved that a detailed statement of the Tourist Trophy accounts be published. The Honorary Treasurer pointed out that it was most impolitic to publish any details, and his attitude was supported by Mr. Nisbet, who explained that if the members of the council could not rely upon the committee they had appointed to deal with the finance they were casting a reflection upon those who were responsible for the balance sheet. He also pointed out that any particular item would be explained to any member of the council privately, but the committee could not see its way clear to issue details of expenses. After considerable discussion on the point, in which Messrs. A. Sharp, Norman, Vernon Brook, E. W. Winckle, and Otto Thomas took part, the meeting decided to accept an amendment from the original proposer, that the question be postponed until such time as the hon. sec. and treasurer of the Birmingham club could go through the accounts with the A.C.U. secretary. Mr. C. A. Smith pointed out during the discussion that the loss on runs and trials for the year was £48 10s. 6d. The meeting was followed by a smoking concert.

Miss Lena Schulte, who is 15 years of age, ascending Edge Hill, near Kineton, with her sister Muriel seated on the carrier. (See page 1089.)

1912 MODELS.

Advance Details of New Pattern Motor Cycles.

Humber quadcar for 1912. It was intended that this machine should be exhibited at the Motor Cycle Show at Olympia, but permission has, we understand, been refused.

Premier.

We have recently had the opportunity of examining the first of the 1912 Premier models. The frame has been considerably lowered, while the new pear-shaped cylinder casting adds greatly to the appearance of the $3\frac{1}{2}$ power unit. The cylinder head has been redesigned to give a smoother flow to the incoming and

and brake rim. In both types the carrier—which is made to take a large tool-bag at the rear below the luggage platform—supports the mudguard, which can be detached at the rear stays and swung down with the carrier so as to provide easy access to the back tyre. The handlebars have been slightly altered to give a more comfortable riding position, and incidentally the appearance has been improved by the alteration. The sidecar model is fitted with the twin 66×80 mm. engine which, with the exception of ball bearing big ends, has undergone no great alterations for the coming year. The Millennium two-speed gear is fitted to the rear hub, and the control is particularly neatly carried out.

A ladies' model with $3\frac{1}{2}$ h.p. engine and Armstrong three-speed gear will shortly issue from the Premier Cycle Co.'s Works, and a twin two-speed sidecar combination is another introduction for 1912.

The tall-bearing connecting rods of the 1912 twin-cylinder Premier. In the shops they are known as banjo big ends

outgoing gases, and the piston has been somewhat lightened. In other respects the engine will remain much the same. All the tank fittings are very large and substantial, and a pipe is led from the petrol tank to the compression cock for the purpose of priming the engine. Great attention has been paid to the mudguarding for the 1912 models. The front mudguard has been fitted with side wings, and the rear guard with an extension over the belt rim, while in the case of the two-speed model a $7\frac{1}{2}$ in. wide curved mudguard covers the belt rim, rear wheel,

The Puch Motor Bicycle.

It was in 1905 that the writer first met Herr Puch, who had then entered a machine for the International Cup Race at Dourdan. Even in those early days of the industry the sidecar was becoming popular, especially in Austria, and Herr Puch and his assistants found the sidecar machine which they brought over from Gratz, where are the Puch Works, to be exceedingly useful preparatory to the race. The machine is one which has established a high reputation for itself on the Continent, and readers will be interested to hear that it is now to be handled in this country. The following will be placed on the market: Two single-cylinder patterns, $3\frac{1}{2}$ h.p., 76 by 100 mm., one of these having two-speed gear, free engine and chain drive, and a 6-7 h.p. twin with two-speed gear, chain drive, fan cooling, and sidecar. This model is fitted with 700 by 80 mm. Voiturette tyres, and it looks an exceedingly sensible sidecar machine. Probably all these models will be on view at the coming Olympia Show.

The single-cylinder engines are provided with mechanically-operated valves, but in the case of the twin the inlet valves are automatic, a practice which is nearly obsolete in this country.

The New 6 h.p. C.C.R.=J.A.P.

The 6 h.p. sidecar illustrated is the outcome of tests which have been made by Messrs. Smith Bros., a Nottingham firm. The engine is of the ordinary 6 h.p. J.A.P. twin type, fitted with Simms magneto, and B. and B. carburetter. It has a Chater-Lea three-speed gear box, with Chater-Lea disc clutch on the engine-shaft. Chain transmission and drip-feed lubrication are other points of interest. The sidecar is attached to the motor cycle at five points, and is sold complete with hood, wind screen, etc.

The new 6 h.p. C.C.R.-J.A.P. sidecar combination.

1912 Models.—

Another Counter-shaft Gear.

The Bowden counter-shaft gear is a new introduction designed to fit existing models. The gear case is provided with a bolt and nut and two slotted plates, which enable the box to be attached to the bridge of a standard frame as illustrated by the sketch of the complete gear fitted to a $3\frac{1}{2}$ h.p. Chater Lea

Fig. 1.

The complete Bowden countershaft gear fitted to a $3\frac{1}{2}$ h.p. Chater Lea-Minerva, which was previously provided with a bottom bracket axle, cranks, and pedals. For the sake of clearness, the starting and clutch operating mechanism are not shown.

Minerva. Reference to the sectional drawing of the gear fig. 3 shows the chain wheel A and sleeve A¹. These receive the power from the engine-shaft by means of a roller chain and transmit it to the clutch centre B. On the central shaft or clutch centre are mounted two gear wheels D and G, and on a separate spindle and formed solid with it are another pair of gear wheels E and F. H is the belt pulley which conveys the power to the road wheel. It will be noted that this is exceptionally large in diameter, centre to centre of belt being 7in. Belt slip should therefore be almost impossible. The operation of the gear is extremely simple. In the centre of the clutch is a wedge bar J J, which is longitudinally operated by means of a cam clutch shown in fig. 2. When the bar J is moved to the right and the spring

Fig. 2.

The clutch pedal mechanism showing the cam for operating wedge bar.

K expanded, the clutches C C are forced upwards, locking the gear wheel G and belt pulley H to the counter-shaft. In this position the shaft carrying the gear wheels E and F revolves idly. This is the normal or high gear position. When the pedal clutch O is moved to the low gear position, the spring K contracts and the bar J is forced to the left, the other pair of clutches C move outwards, and the gear wheel D is locked to the counter-

shaft, and driving the pair of wheels E and F, the power is transmitted to H through G, and the belt pulley revolves at a slower speed than the counter-shaft. This is the low gear position. The reduction in gear ratio is brought about by the difference in the diameters of the four wheels D E F G, the gear train being arranged in a similar manner to the back gear of a lathe.

With a 7in. diameter belt pulley on the counter-shaft and a 19in. belt rim and the standard chain sprocket on the engine-shaft and counter-shaft the top gear is about 5 to 1. The engine sprockets can be supplied with 15, 16, 17, and 18 teeth, the counter-shaft sprocket having 28 teeth. The starting device consists of a segment of a gear wheel P, meshing with a small toothed wheel on the counter-shaft. The segmental wheel carries a crank and pedal, and by kicking downwards and backwards the engine is revolved two and a half times to one-half revolution of the pedal starter.

The Bowden Wire Co. inform us that on test they can start a single cylinder $3\frac{1}{2}$ h.p. Minerva or an 8 h.p. Bat-Jap with certainty by one thrust down of the crank. Although designed for a standard 500 c.c. engine, the gear has been thoroughly tested on an 8 h.p. J.A.P. to find any faults there may be in the construction. This policy of trying the gear on a machine with a higher powered engine than the standard $3\frac{1}{2}$ h.p. is to be commended; if it will stand an 8 h.p. engine it should be perfect with a lower power.

The whole of the bushes are made of phosphor bronze, the gear case is of aluminium, and the teeth, which are 8 pitch,

are of hardened steel, also the shafts. The gear box is lubricated with Price's hub grease, the filling tap being at the top, and a drain off screw at the bottom.

Fig. 4.

Exterior view of the complete gear with starting and clutch pedals.

The gear was weighed in our presence, the total weight being 15 lbs. In addition to the pedal control already described, the gear can be controlled by a Bowden wire and lever with ratchet fitted on the top tube. One of these gears was fitted to the $4\frac{1}{2}$ h.p. Ixion-Precision ridden by W. R. Jones in the Quarterly Trial last Saturday.

The counter-shaft type of gear is certainly growing in popularity, and the enterprise of the Bowden Wire Co., in marketing a gear which can be fitted to almost any standard model, will doubtless receive its just reward in the form of an extensive demand.

1912 Models.—

The new method of attaching the A.J.S. counter-shaft gear box to the frame.

A.J.S.

The method of attaching the counter-shaft gear to the frame has been improved for next year.

As will be seen, the box has a flat top, with slight extensions at the side which fit closely on a special lug, thus preventing any tendency to twist. It is held in position by two studs which pass through slotted holes (to allow for chain adjustment) in the lug. The box itself has been rendered considerably more accessible by a slight alteration in the main casting. It is no longer constructed in two halves, but is cast in one piece, with a separate

Timing gear of the new Rover. Section of cam, rocker and tappet, showing a 1912 improvement.

end plate. By unscrewing the thrust washer and removing this plate, the gears and shafts can be dismantled and re-erected by the merest novice.

Tormo.

The Tormo Manufacturing Company (67-68, Bunhill Row, London, E.C.), agents in Great Britain for the Sarolea motor cycle engines and F.S. ball bearings, will be marketing the same models as those sold during this year, and in

1912 model 2 1/2 h.p. Premier, showing the new swinging mudguard to render the rear tyre more accessible.

addition will introduce a new 2 1/2 h.p. single-cylinder engine, 66 by 86 mm. This is identical, with the exception of the stroke, with the 8 h.p. 1911 model, which was 66 by 72 mm.

New Rudge Variable Gear Model

We were recently privileged to inspect the new model Rudge machines which are nearing completion and have formed the opinion that these machines which have made such leaps and bounds in their comparatively short active life will be even more to the front in 1912, not that there are any striking departures in design to chronicle, but there are many minor improvements which cannot fail to commend themselves to the practical rider. First and foremost the machines have been carefully redesigned with a view to reducing the weight in every possible part consistent with strength. For instance, the spring forks are neater and lighter, the lugs of the frame are lighter, the stand and carrier fittings have been redesigned, likewise the variable gear. This last mentioned model possesses the most notable departure, and the gear now

possesses the undoubted advantage of a free engine, no matter what ratio of gear is employed. It will be remembered that formerly the gear had to be at its lowest point before the free engine came into operation, but by a clever adaptation of

New design stand and carrier on the Rudge.

the Rudge plate clutch in conjunction with the gear mechanism on the engine-shaft a free engine is possible with all speeds. Though carried in a compact

The new model two-speed counter-shaft gear James. The outer chain case has been removed for the purpose of the photograph. We illustrated the gear three weeks ago.

1912 Models.—

The two types of Rudge cylinders for 1912, known as the "oval" and figure 8.

casing the free engine and variable gear mechanism are entirely separate. The width from the centre of the engine pulley groove is 5in. An inherent advantage of the Rudge gear is the fact that the belt always runs in line. The inner flange of the engine pulley is the movable one, and any variation results in a corresponding movement of the outer flange of the rear belt pulley. We tried this gear on the road in the rough, and it

The new cone-shaped cup and cotter permitting a longer spring.

worked admirably. The quadrant will enable twenty different gear ratios, which should appeal to the sidecar user.

Detail Improvements.

Two other models which will be marketed are the $3\frac{1}{2}$ h.p. clutch machine and the T.T. model. We detail a number

New design rear brake on the 1912 Rudge,

of minor improvements which are common to all R.W. motor cycles.

A new rear brake has been adopted which gives a much greater gripping surface than formerly, and is as powerful a brake as we have ever tried.

Next year an Eisemann magneto will be fitted, which is a very compact instrument, with sloping pole pieces, which enables a hot spark to be generated at slow speeds. A neat arrangement is provided for the finest possible adjustment of the magneto timing, known as the

Section of the redesigned Rudge variable gear and free engine plate clutch.

Vernier micrometer adjustment, which amounts to $\frac{1}{32}$ th of a revolution. A cam with fourteen teeth is fitted on to the armature-shaft. On the periphery of this cam thirty-one teeth are cut which fit

into corresponding serrations in the exhaust cam wheel. It will thus be seen that the adjustment is less than one degree. The exhaust valve lifter

is a great improvement, and, being carried to the left-hand side of the machine, leaves the timing side very clean and easily get-at-able. The valve lifter has a very easy motion due to the long leverage. The new Rudge lifter is a reversal of the usual order of things, for the action of raising the inverted handle-bar lever pushes down the lifter, so causing the other end to act upon the bottom of the tappet. The lifter lever is fulcrumed in a boss cast on the crank case.

The engine has undergone minor alterations only, nor will this cause any consternation when its wonderful achievements on the track are considered. The exhaust valve guides are now cast solid with the cylinder, which means that they can be bored absolutely true with the seatings. A new cotter and cup arrangement is shown in the sketch. It was found with the old cotters that there was a tendency for them to break, but by the new arrangement of a cone-shaped cup, a cotter is practically unbreakable. The special design of the cup enables a spring of the longest possible dimensions to be used.

The new model Rudge with variable gear, giving twenty different ratios.

T. Pollard (3½ h.p. Triumph) climbing Cilcain in the Liverpool A.C.C. trial.

Leicester and District M.C.C.

The new headquarters have now been permanently fixed at the Hind Hotel, London Road, Leicester (nearly opposite Midland Railway Station). Members will find every accommodation here for storage of their motor cycles, whilst the approach, from a traffic point of view, is far in advance of the original headquarters. A special club room will be open at all times for the convenience of members, also use of billiard room, etc., at especially reduced rates. Members of other motor cycle clubs are cordially invited to attend when visiting or passing through Leicester.

Surrey M.C.C.

The annual hill-climb took place on Saturday, the 7th inst., on a hill near Newlands Corner. The venue originally fixed had to be changed because the surface of the hill had been rendered unsafe by rain. The hill actually used was an easy one, but owing to the unfavourable conditions there were a considerable number of failures due to slipping belts, ignition faults, etc. F. W. Barnes won every class, in addition to scoring the fastest time of the day; he also secured the special gold medal presented by Zenith Motors, Ltd., and offered for the best performance on formula in any class. Classes III. (twin-cylinder machines) and V. (passenger machines) were abandoned owing to insufficiency of entries. Results:

CLASS I.

Rider and machine.	Time.	Fig. of merit.
1. F. W. Barnes (2½ Zenith-Gradua) ...	X+17.2	237
2. H. Green (2½ Douglas) ...	X+42.8	114

CLASS II.

1. F. W. Barnes (2½ Zenith-Gradua) ...	X+15.4	257
2. J. Kennedy (3½ Bradbury) ...	X+15	144 0
3. P. Mitchell (4-cyl. F.N.) ...	X+21.8	144.7

CLASS IV.

1. F. W. Barnes (2½ Zenith-Gradua) ...	X+13	239
2. F. A. McNab (3½ Trump-Jap) ...	X+22.6	155
3. E. Cox (3½ Zenith-Gradua) ...	X+18.6	153

CLASS VI.

1. F. W. Barnes (6 Zenith-Gradua) ...	X+ 2.8	Decided on fastest time.
2. A. J. Luce (5 T.T. Bat) ...	X+ 9.8	
3. J. Kennedy (3½ Bradbury) ...	X+14.2	
4. F. A. McNab (3½ Trump-Jap) ...	X+23.6	

Walthamstow M.C.

The above club held a team competition on the 8th inst. over a twenty-five miles circular course, which had to be covered twice, non-stop. No watches or speedometers were allowed, and the team of three riders who finished the course and were nearest to a schedule of 20 m.p.h. at a secret check were to be awarded Mr. G. West's prize. The following was the winning team:

Rider and machine.	Time error.
H. T. Browett (8 h.p. Minerva and sidecar) ...	7m. 41s. fast
G. Henbury (7 h.p. V.S. and sidecar) ...	1m. 28s. fast
A. E. Uffleman (3½ h.p. Humber) ...	2m. 58s. fast
Total ...	12m. 7s. fast

A prize presented by the Rex Motor Manufacturing Co. for the best individual performance was won by A. G. Peppercorn (3½ h.p. Bradbury), 1m. 8s. fast.

Scarborough and District M.C.

On Wednesday last week the last monthly climb for this year was held on Staxton Hill. The weather was fine and the road dry, though somewhat washed out by recent rains.

With only one entry the class for twins was abandoned, and the contest was confined to the single-cylinders of 4 or less. Timing was done mechanically, stop watches being started as each machine broke a thread.

Fig. of Merit.

*1. W. F. Tranmer (3½ Norton) ...	79.121
2. W. Brown (3½ Zenith-Gradua) ...	82.079
3. T. S. Webster (3½ Norton) ...	83.565
4. — Marson (3½ Zenith) ...	105.95
5. W. Jackson (3½ Premier, three-speed) ...	110.406
6. — Lawson (3½ Zenith) ...	130.653

*Fastest time.

Scarborough and District M.C.C. hill-climb at Staxton C. Marson (3½ h.p. Zenith-Gradua) approaching the first corner rather wide. He was placed fourth.

Brecon motor cyclists who are about to form a club. (See paragraph on this page.)

Brecon Motor Cyclists to Congregate.

It is the intention to form a motor cycle club for the Brecon district. Will all those who are interested communicate with Mr. G. T. Jones, Arfon House, Brecon, so that a meeting may be called at an early date?

Bristol B. and M.C.

The next trial for members who have not won a first prize in a motor cycle competition will be held next Saturday. It will be in the nature of a speed-judging and reliability non-stop run, over a selected circuit at twenty miles per hour. Watches allowed, but no speed-recording instruments. Start and finish White Lion, Westbury.

Purley and District M.C.C.

Owing to the large number of competitors who failed to find the trail in the club's speed-judging contest, the prize for which is a pair of Kempshall tyres, this event was re-run on Saturday, the 7th inst. Probably, owing to the heavy rain which prevailed all the afternoon, the entry amounted to only seven, five of the original competitors failing to put in an appearance at the start. The course ran out to eighteen miles in length, and the first place was taken by C. W. Meredith (3½ Zenith), whose error was only 0.75 m.p.h. W. G. Fowler (7 Indian and sidecar) ran him a close second, error 1.57 m.p.h., and third place was scored by A. C. Huskinson (5 Indian), error 2.4 m.p.h.

Putney and District M.C.C.

A reliability trial will be held on October 22nd to Brighton and back. The first prize is a tyre presented by G. W. Drew. There will be other prizes according to entry.

North Middlesex M.C.C.

The annual London-Stratford-on-Avon and back reliability trial for the Premier trophy, presented by the Premier Cycle Co., took place on October 8th, when twenty odd started from headquarters, Gatehouse, Highgate. The following awards have been made: 1, Mills (3½ h.p. Premier), Premier Cup and Kempshall tyre; 2, Tustin (2½ h.p. Enfield), X.L. All saddle; 3, Bennett (3½ h.p. Norton), service belt; 4, Dangerfield (3½ h.p. Zenith), N.L.G. exhaust whistle; 5, Williams (3½ h.p. Premier), Bond belt and tube case; 6, Deacock (3½ N.L.G.), club medal; 7, Heany (3½ h.p. N.L.G.), club medal; 8, Wingham (3½ h.p. Triumph), club medal; 9, Hilger (3½ h.p. Humber), club medal; 10, Cheers (5 h.p. Indian), club medal; 11, Miss Hammett (2½ h.p. Douglas), club medal; 12, Fletcher (2½ h.p. Douglas), club medal; 13, Carrodus (3½ h.p. P. and M. and sc.), special surprise prize, given by Vice-President Petch. Only one mechanical breakdown was experienced throughout the trial, and thanks are due to Messrs. Boocock, Hill, Petch, Rowden, and Scott for officiating in this most successful event. The meet on October 22nd will be at the Gatehouse, Highgate, at 10 a.m.

THE INTEREST IN MOTOR CYCLE HILL-CLIMBS.

The crowd watching competitors climb Cûcain in the Liverpool A.C.C. reliability trial in North Wales, described in our last issue.

MORE MILITARY MOTOR CYCLING.

BY A RETIRED REGULAR OFFICER.

ON Sunday, September 17th, ten motor cyclists, enrolled through the Automobile Association and Motor Union, and about a dozen motor cyclists belonging to the Cambridge University O.T.C., were sent to Aldershot to assist the Royal Engineers in carrying out some experiments in connection with wireless telegraphy and air lines. For

Godalming, whilst the Cavalry Division Headquarters were at Netheravon. Altogether this was a fairly extensive area, and meant a good many miles for motor cyclists to cover in order to deliver their despatches.

The special idea was that the Director of Signals had arranged to take over two lines from Guildford, the advanced base, to Dover from the local Govern-

(1) Headquarters of the General Staff at Aldershot (Stanhope Lines). Motor cyclist despatch riders waiting for despatches.

(2) Royal Engineer Officer's Mess. (It was in connection with the Royal Engineers that A.A. and M.U. motor cyclists were obtained.)

(3) Headquarters of General Staff at Aldershot, showing orderly tent in the rear.

(4) Headquarters moved to Odiham. The orderly tent with orderlies and despatch riders waiting outside.

this purpose, A and C Signal Companies R.E., consisting of eight cable and three air line detachments, were employed.

The general idea was that a Blue Force organised in one army of two divisions, one army of three divisions, one detached infantry division, and one cavalry division, with line of communications, has landed in England (a friendly country which has been invaded by Wales), at Dover and Brighton, and had moved by rail, and march, to the area Godalming, Guildford, Reading, and Alton. The cavalry division was in advance, reconnoitring for an enemy in the direction of Salisbury Plain.

The position on the morning of September 18th was: The General Headquarters at Aldershot, the First Army Headquarters at Hartford Bridge Flats, 1st Division Headquarters at Eversley, 2nd Division Headquarters at Hartley Row, the Second Army Headquarters at Farnham, the 3rd Division Headquarters at Odiham, the 4th Division Headquarters at Alton, the 5th Division Headquarters at Farnham, and the 6th Division, comprising General Reserve, at

ment, and one line from Guildford to Brighton.

The Director of Signals had also arranged for the line of communication to erect an air line from Guildford to Aldershot, and one local line between the same places had been handed over.

The Director of Signals received instructions late on September 17th to establish communication with the Cavalry Division and First and Second Armies and 6th Division (i.e., the Reserve), and also between headquarters of armies and their respective divisions. It was in carrying out this establishment of communication that the motor cyclists were mostly employed.

On September 19th the General Headquarters were moved to Odiham, and on the 20th to near Basing House (Basingstoke).

The experiments carried out seem to have been entirely successful,

and the weather, fortunately, was fine, although on the 19th and 20th some very sharp showers were experienced.

All the motor cyclists seem to have escaped any trouble, other than a puncture or two, with the exception of one man, who lost a spring in the

More Military Motor Cycling.—

contact-breaker of the magneto, and who had to travel from Basingstoke to London by train in order to replace it.

The Desiderata of Military Motor Cyclists.

The result of the experiment as regards motor cyclists is that it is found that there should be ten men to each signal company of the R.E.; *they should always be the same ten men*, so that they know their officers and their officers know them and their capabilities; they should, of course, be subject to military discipline as Territorials or some such arrangement, it not being at all necessary that they should be regular soldiers. Each man should also be thorough master of his machine, with a good all-round knowledge of other makes of motor cycle besides the particular make he rides. Each despatch should be taken by two men, in case one breaks down, owing to puncture or any other cause, so that, whereas ten men per company are sufficient, yet really twenty men are required if the arrangement of two men per despatch is to be carried out.

In addition to this, all motor despatch riders should be encouraged in map reading, map making, use of the compass both by day and by night, besides such things as signalling, a knowledge of the various bugle calls, etc., all of which would greatly tend to make the men useful generally. It is quite surprising how few there are amongst motor cyclists who really know how to "set a map."

A Serious Occupation.

The ideal military motor-cyclist despatch rider is in reality far more than a mere messenger, as in actual warfare, when telegraph wires are cut, he would have to get a message through on his motor cycle, and on the prompt delivery of his despatch might depend the fate not only of the army, but of the country. This would require him to use all his knowledge, and keep all his wits about him, and his eyes open, and stopping for lunch, etc., whilst on the road with a message (as has happened on this and other occasions), would, of course, be out of the question; so that military motor cycling must be treated seriously by those who undertake it.

INTERESTING SIDECAR FITMENTS.

THE photographs reproduced depict Mr. and Mrs. Edward Cox, of Guildford, and their $3\frac{1}{2}$ h.p. Zenith-Gradua and sidecar. Mr. Cox is the chairman of the Surrey Motor Cycle Club and a regular attendant at club runs and competitions. In a letter to us he mentions that he has had a very good season's running, his mileage including a 600 miles tour without any trouble. He draws special notice to the luggage carrier and spring shackles on the sidecar, which greatly add to the passenger's comfort.

The dust screen at the rear of the chair, and also the sidecar wind screen will be observed. Another detail which might pass unnoticed is the strap from the tube under the tank to the sidecar stay. This is fitted as a precaution should the front fixing of sidecar to bicycle move. There have been serious accidents recently due to this fixing giving way, and that is why Mr. Cox considers this or some other precautionary fixing which might help in some way to minimise the risk advisable.

Mr. and Mrs. Edward Cox and their $3\frac{1}{2}$ h.p. Zenith-Gradua and sidecar. Several interesting fitments will be observed on the sidecar attachment.

Earle L. Ovington, the American motor cyclist who came over to this country a year or two ago, is now an airman. Following England's lead, Postmaster-General Hitchcock, of U.S.A., has issued an order authorising Ovington to act as an air mail carrier, and further directing the postmaster at New York to des-

patch letters *via* the aeroplane route, the official number of which is to be "Route 607,001."

Ovington was recently appointed to carry the mails over a short route between Nassau and Brooklyn, and is now completing preparations to transport official mails from New York to Los Angeles.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rex Sidette.

(1.) I contemplate purchasing (when I can sell my two-seater motor) a Rex sidette 5-6 h.p., two-cylinder, listed at about £70-£75. I want it for short trips and tours, not racing. Do you consider it suitable? (2.) The steering of sidecar wheel by connecting rod from front hub seems to me to reduce strain on back axle, and will probably avoid accidents due to breakages of sidecar axles.—E.W.H.

(1.) We think the machine in question would suit you admirably. (2.) We certainly like this arrangement.

Occasional Sidecar Use.

I would be obliged for information on the following points. I am a pedal cyclist of long standing, and am thinking of taking up motor cycling. I do not know anything practical of the subject, but have made a careful study of "Motor Cycles and How to Manage Them."

(1.) What is the best make of machine to get which is likely to give least trouble to novice? I thought of a Triumph. (2.) I would require a machine which could be used occasionally for sidecar work; in this case would a Triumph be the most suitable (3½ h.p.)? (3.) What is the simplest and most easily detachable sidecar to get for Triumph machine? It would only be used two or three times a month, and would want to be readily taken off and put on. It would carry lady passenger about ten stones weight. I am myself about 11½ stones. (4.) Is steering of machine with sidecar more difficult than with singly? (5.) Are there likely to be any special improvements in machines for 1912 making it easier for novices? I live in fairly level district in which there are a few gradual hills (200 to 300 yards long). Am seven miles from a town in which there is an agent for Triumph and Humber machines.—KILDARE.

(1.) You could not do better than invest in the make of machine referred to in your letter. (2.) If you only use a sidecar occasionally this machine will do admirably. (3.) Any one of the best known makes, all up-to-date sidecars are readily detachable. (4.) Yes, at first the steering of a sidecar is a little difficult, but you will soon get used to it. (5.) Yes there will be several improvements for 1912 which will simplify design.

Large or Small Tyres.

(1.) I have a 2 h.p. lightweight motor cycle of a good make fitted with 1½ in. tyres. Would it be of any advantage to exchange these for 2 in. tyres during the winter?

(2.) Can you tell me of any firm which is prepared to fit up a push-cycle with a motor, etc?—M.R.E.

(1.) Your tyres would wear longer and the machine be more comfortable if they were of a larger size, though the larger the tyre the greater the tendency to side-slip, but in these small sizes we do not think you will find the tendency much increased. (2.) No, we do not know of any firm that would fit up a pedal cycle as a motor bicycle, though, of course, you might find some local cycle agent who would undertake this. It is a conversion which we do not recommend.

Collision with Stray Horse.

While riding to work early in the morning when it was dark and foggy I was knocked off my motor cycle by a horse which had strayed from common land.

I was hurt and the machine badly damaged. The owner of the horse said at first that he would pay cost, which amounted to £8 10s., but afterwards he refused to do so. What do you advise?—W.E.W.

Our legal adviser writes as follows: The fact that the horse strayed from common land certainly makes "W.E.W.'s" claim distinctly weaker, as by the Highways Act the penalty for leaving a horse to stray on to the highway does not arise when horses stray from a common. This really affects the question from the point of view as to whether the owner of the horse could be summoned in a police

Mrs. Cheverton, of Newport, mounted on her Singer Moto Velo. The child carrier at the rear is interesting, for Master Ronald looks quite at home, although the machine was travelling well up to the legal limit at the time the photograph was taken.

court or not. As regards a civil action, the owner is not ordinarily liable for damage, which is caused by a horse straying on the highway. The morning being foggy and dark "W.E.W." should have gone along very slowly, and if he did not he was guilty of negligence, especially as the road adjoined the common land. He has no claim against the owner of the horse unless he can show that such owner knew the animal was dangerous or likely to do mischief. Under the circumstances, I do not think the fact that the owner promised to pay and then altered his mind affects the position.

Abnormal Petrol Consumption.

I have just taken to motor cycling, and am riding a 3 h.p. Quadrant. It is not a fast machine, and I have no trouble on the level, but on ascending a steep bridge or hill it loses power. I open the throttle and advance the spark with no success—the engine races on but the machine stops. I took a piece out of the belt, but it is no better. Should I take a piece more out, or can you tell me of any reason? I might mention one gallon of petrol will only run me thirty-six miles.—A.F.S.

Possibly your pulley is worn and requires truing up. The flanges should be quite flat and the angles between them 28°. The belt should be moderately tight, it is apparently slipping at present. Your petrol consumption is abnormal, there must be a leak somewhere. You ought to get at least 90 m.p.g..

Dual Ignition.

I have a Sunnys magneto S.M.I. working a 7-9 h.p. two-cylinder V engine. Will you please inform me (1) if it is feasible to attach just an accumulator only to supply a current when the magneto fails; or (2) is it essential to have a full instalment of dual ignition?—A.V.W.

(1.) No; we regret to say that it is impossible to work an accumulator in conjunction with this magneto. (2.) A separate system of ignition must be fitted.

Dry Batteries and Accumulators.

(1.) I have bought a Hellsen dry battery, and think of using it in turn with my accumulators as a test. Shall I be right in coupling up the dry battery and an accumulator with a two-way switch in the same way as I should if using two dry batteries? (2.) The lift on the exhaust valve of my 3½ h.p. Peugeot is only ⅜ in. I think the tappet is worn. Could I improve this by getting a longer tappet, or by lengthening the valve stem and shortening the tappet guide? I have fitted new inlet and exhaust valves, but the exhaust valve is slightly in pocket. Would this cause overheating? (3.) I am thinking of having a new mount next season. I am informed that Alldays and Onions, of Birmingham, are making a 3½ h.p. with two speed and free engine much cheaper than other local firms. Can you give me any information about this machine?—G.J.T.

(1.) Yes; certainly you can connect up the dry battery and the accumulator with a two way switch. (2.) The lift should be

about ¼ in.; only a new cam will remedy matters if the cam is worn. Probably the trouble is due to a worn tappet or too much clearance between tappet and valve stem. (3.) We have had no personal riding experience with the machine about which you enquire up to the present.

Advertised Weights.

I bought a 1911 machine, the weight of which was stated in the catalogue and in advertisements to be 160 lbs., whereas the correct weight is some 205 lbs. Have I any redress?—G.D.E.

Not unless you purchased the machine on the express understanding that the weight was 160 lbs. Advertised weights are only approximate.

READER'S REPLY.

With reference to an item under the heading of "Queries and Replies" in your issue of October 5th, we must take exception to the reply to the detail headed "Two Sparks or One." The answer given to the first part of the query is quite correct, but with regard to the last sentence, which reads "no damage will accrue to the magneto" in this, we beg to differ. As you are aware, we have recently made a very extensive series of experiments in connection with multi-spark ignition, and further, have had considerable experience in cases where magnetos designed for single-spark have been used for two-spark work, and these experiences have proved that it is most inadvisable to use magnetos in this way. The experience which we have gained has led to the design and construction of special magnetos for giving two sparks without risk of injury to the winding or insulation of the magneto. These machines, however, have not yet been designed for all types of engines, but we shall be pleased to forward particulars to any of your readers who may be

interested, as to how far we are able to supply the apparatus for two-spark ignition.—THE BOSCH MAGNETO CO., LTD. [It is not quite clear from the foregoing whether it is bad for a magneto to use a double-pole plug or whether a second plug of the ordinary kind which gives no spark will damage it. The latter is what we had in mind.—Ed.]

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"G.H.S." (Brigg). Corah motor bicycle, particularly in regard to reliability.
 "A.C." (Aston Manor). 4½ h.p. Precision engine; also Mabon gear.
 "R.P.B." (London). 2½ h.p. New Hudson; also 2 h.p. Humber lightweight.
 "G.S." (Ilford). Kempshall heavy non-skid tyres, especially on the back wheel of a 3½ h.p. machine with sidecar.
 "G.B." (Doncaster). 2½ h.p. A.J.S., two-speed, chain-driven model.
 "V.D.N." Wilkinson T.A.C.
 "J.F." (Glam.). Four-cylinder F.N., especially with sidecar.
 "No. 54" (Wakefield). The Mabon clutch (Export Model) or Kerry Abingdon free-engine clutch fitted to K.A. machine.
 "I.M.D." (London). 2½ h.p. two-speed Enfield.
 "A.B." (Southport). A.C. or other form of sociable.
 "W.A.M." (Mitcham). Four-cylinder F.N. with two-speed gear and clutch in conjunction with sidecar.
 "F.W.E." (Ottery-St.-Mary). Hub gear and clutch or any gear with free engine which can be adapted to the rear wheel of a Douglas.
 "E.A.C.L." (Sedbergh). Wear on tyres of Scott machine, also reliability of T.A.C. and sidecar.

RELIABILITY TRIAL IN NORTH WALES.
 Start from Birkenhead of the second stage of the Liverpool A.C.C. 200 miles trial.

BOOTH'S FOR VALUE

N.S.U., 4 h.p., brand new, single-cylinder, ideal sidecar machine; listed £48	£36 0
REX DE LUXE, 5 h.p., twin, two speeds, handle starting, M.O.V., 1911 model	£42 10
REX DE LUXE, 5 h.p., twin, two speeds, 1910	£42 10
BRADBURY, new 1911 model	£42 10
REX, 3 1/2 h.p., spring forks, magneto, h.b. control, 1909 model	£22 10

HUMBER, 3 1/2 h.p., 1909, two speeds, handle starting, h.b. control	£26 10
REX, 3 1/2 h.p., 1908, spring forks, magneto, h.b. control, beautiful condition	£16 10
N.S.U., 3 1/2 h.p., two speeds, magneto	£19 10
N.S.U., 3 1/2 h.p., magneto, good order	£16 10
QUADRANT, 3 1/2 h.p., magneto, spring forks	£16 10
REX, 5 h.p., twin, with forecar	£11 10
N.S.U., 3 1/2 h.p., M.O.V., magneto	£15 10
N.S.U., 3 h.p., M.O.V., nice order	£10 0
REX DE LUXE, two speeds, magneto, handle starting, h.b. control	£26 10
ENFIELD, 2 1/2 h.p., M.O.V., acc. ignition	£9 10
AXEL, 2 h.p., Minerva engine, M.O.V.	£5 10
HOBACK, 3 h.p., vertical engine, low	£8 10
ROYAL STAR, 2 1/2 h.p., vertical engine	£5 10
KERRY, 2 1/2 h.p., 26in. wheels, vertical engine	£8 10
WERNER, 2 1/2 h.p., vertical engine, 26in. wheels, low built, finished French grey	£6 10
PUSH CYCLES TAKEN IN EXCHANGE.	

TRICARS.

TWIN REX, air-cooled, belt drive, fit-all two-speed gear	£14 10
STEVENS, 1 h.p., single-cylinder, air-cooled, Roc two-speed gear, handle starting	£14 10
TWIN REX, 5 h.p., air-cooled	£11 10

CARS.

DE DION, 6 h.p., genuine throughout, two-seater, two speeds and reverse, nice order	£27 10
EAGLE, 14 h.p., four-cylinder, five-seater, two speeds and reverse	£27 10
BEDELIA, 1911, 5-7 h.p., air-cooled twin engine, magneto; cost £93	£55 0
HUMBER, 5 1/2 h.p., two-seater, bucket seats, two speeds and reverse	£18 10

We have a few Accumulator Models which we have taken in exchange for new machines. They are in running order, and complete with belt, coil, and accumulator. We wish to clear, and offer them at ridiculous prices.

2 1/2 h.p. MINERVA	£4 15
2 1/2 h.p. DE DION, vertical engine	£4 10
2 1/2 h.p. WERNER, very low	£4 10
2 h.p. ARIEL, M.O.V.	£5 10
2 1/2 h.p. STANDARD, vertical engine	£4 15

We will allow full price paid for these in part payment for better machines within six months from date of purchase.

MISCELLANEOUS.

Carburettors—Longbarrow and F.N.	4/6
New Amac Carburettor, H.B. control	15/-
Long Handle-bars, drop ends	5/6 and 6/6
Coronet Silencers, up to 5 h.p.	3/3 and 4/6
XL'ALL Spring Forks	9/6
Gripskin Belting: 3in. 10d., 3in. 11d., 1in. Wide Mudguard, 3in., 2/3; 4in. 2/11 pair.	1/-
Handle-bar Watches, with holders	4/3
Magneto Handle-bar Switches	2/1

CORONET SIDE CARS

ONE MINUTE REQUIRED.
CORONET SIDECARS are all fitted with our improved QUICK DETACHABLE JOINTS, and can be detached in one minute.

LESS POWER REQUIRED.
In consequence of the unique design of frame in the "CORONET," less power is required to drive, compared with other sidecars.

MODEL C.—£7 2s. 6d.

MODEL A.—£5 5s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Excellent upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing lopsided about this attachment.

Delivery from stock to suit TRIUMPHS, N.S.U.'s, REXES, P. & M.'s, BRADBURY'S, etc. Discounts to Agents.

REMEMBER

The value of your present machine is depreciating week by week.

Why not exchange now or at the end of the season for a 1912 model?

We can allow far better prices than those which rule in April, and, if you wish, advance you a big part of the allowance in cash.

Why not write, or, better, call and discuss with us. ANY MAKE.

ORIGINALITY IS THE SOUL OF BUSINESS

We are nothing if not original—in our advertising; in our system of business; in our purchases. We imitate no man. No other firm will treat you so well. No other firm will send you the goods and if they don't suit you send your MONEY BACK IN FULL. NO other firm will let you have a machine to try on your own hills; to be examined by your own pet mechanic; for you to take off the cylinder and look inside. The privilege of doing all these things puts £5 on the value of any of our machines.

By-the-by, when reading our lists, don't expect us to indulge in the luxury of allowing £25 for a machine that you will be pleased to take £10 for. We cannot do this unless you allow us to put £15 on the value of the machine that you purchase from us. Therefore, if our quotations, on the face of them, do not seem as big as those of other firms, remember that the machines we are selling are worth more, and that you have the privilege of seeing and examining the goods before deal is closed. There are no fancy prices allowed for yours, and no fancy figures put on ours. On the top of all this, we consider that the people who deal with us are not fools, and we give them credit for having more sense than to believe that Hitchen's, of Morecambe—or anyone else—can allow £25 for an accumulator machine without putting a fictitious price on the machine that you are buying.

Note that when you buy an accessory of any kind from other people, if it is not exactly what you want, you can MAKE THE BEST OF IT; with US you CAN RETURN IT, and have the money back in full. It comes per return of post, without any rebate or reduction. We do not enquire why you are asking for the money back, but you get it, knowing that you at once become a walking testimonial of our straightforward system of business.

We are always prepared to receive offers for anything that we have to sell. By this we mean offers that are sensible. We do not advertise our goods at such a price that we can accept £10 for any £20 advertised machine, and please note the season is not over with us; our system of business makes a busy all the year round.

Regarding our tyres, we cannot indulge in allowing 5/- for an old cover that is worth 2/- off Morecambe Studded covers at 11/11 and 12/11. We are warning your trade, and duty the world to do better for you—if you are satisfied with good, substantial stuff. Cheap, low-priced rubbish we don't stock. If you have not given us an order, you have only to try us once, and you will find that WE DO return the money; WE DO send you a cheque; and WE DO all things that we say we do. But we DON'T give anything away free, and we don't sell rubbish.

By-the-by, we answer every letter if people will only put their names and addresses on same. If you don't get an answer, it is because your address has been omitted. Now, boys, so long until next week. The Canary is fine.

Complete Suit, 25/-, less 10% = 22/6. Only about Six Dozen Suits left. Secure one while prices are reduced.

Notice to Purchasers.—We have made a speciality of our Winter Garments, and can guarantee complete satisfaction. If, however, you do not approve of goods, and same are returned in 3 days undamaged we will refund amount paid.

Terms.—Nett cash with order. Goods sent carriage paid. Send chest measurement and length desired for Jacket, and inside leg measurement only for Overalls. Catalogues and patterns sent on application.

G. PAWS & SONS,
MOTOR CLOTHING SPECIALISTS,
The Albany, Oldhall Street, LIVERPOOL.

TRICARS FOR SALE.

6hp. Two-cyl. Advance Tricar, adjustable pulley, coach-built body, coil and accumulator ignition, long footboards, 3 brakes, first class condition throughout; offers.—Box No. 1,4,552, The Motor Cycle Offices, 20, Tudor St., E.C.

4hp. M.M.C. Tricar, 1911 B. and B. carburettor, Whittle belt, latest Davidson's tank, recently overhauled and enamelled slate grey and brought up to date, fine order and condition, all accessories; £18.—Howie, 17, Lilly Av., Withington, Manchester.

1910 A.C. Mighty Atom, Speed M del Sociable, Cape hood, Lucas headlights, Dependance back, front wheel brakes, several real practical improvements, spare tyre and tubes, not a fault, perfect as new, all spares; £75, on 1910—113, High St., Lewisham.

TRICAR, Rex engine, 3 1/2hp., 2-speed, free engine, Cycle-optic gear, just been overhauled, with new cylinder head and piston rings, new tyre to back wheel, 3 new tubes, new saddle, handle-bar, and lamps, perfect running order; trial given; a real bargain, £20.—Miles, Hulse Rd., Salisbury.

SIDECARS AND FORECARS.

SIDECAR, nearly new, upholstered, new tyre; £5.—Write, Fischer, 9, Gt. Pulteney St., W.

1911 Milford Castor Wheel Sidecar, new tyre, nice order; £26/15.—1, Ebner St., Wandsworth.

SIDECARS, brand new, beautifully upholstered, fit any make; £31/1.—Rex, 5, Heath St., Hampstead.

RIGID Sidecar, 26in. wheel, tyre and tube complete, fit any machine; 70/-—Western, Uffculme, Devon.

GLORIA Sidecar, for Triumph motor, only run 500 miles, good condition; £8.—Young, Hamletta House, Looe-down, Bath.

5hp. Dot, Gradua gear, Druids, etc., almost as new, also sidecar, £35, complete; separate or exchange.—2, Victoria Buildings, Fishergate, Preston.

MIDDLETON'S—Wholesale, retail, sidecar manufacturers, repairs, exchanges, second-hands.—Watson St., Newington Green, London, N. Phone Dalston 2126.

MILLS-FULFORD 1911 Rigid Sidecar, Canoe-M del, only done 800 miles, new Dunlop and special spring, done in green leather; cost £11, £8.—Gonville, Walsner, Kent.

SIDECARS.—The famous quick detachable Montgomery, all models stocked.—To be seen at the sole London agents, Pielon and Moore, Ltd., 4, Percy St., Tottenham Court Rd., W.

SIDECARS, largest stock; best value in England; all built of Chater-Lea fittings; prices, £6/10, £5/10, £4/15, second-hand from £3/15. fitted free while you wait.—C. A. Edgar, 123, Holloway Rd., N.

THE Pythian Spring Wheel Sidecar (Morrison's patent) is undoubtedly the most comfortable on the market, send for particulars, prices from £3/15; Pythian motor cycles, £46/15.—Clarke Bros. (Leicester), Ltd., Lower Free Lane, Leicester.

TOTTENHAM—Sidecars, 1911, nicely upholstered, fit any machine, £3/10/6; quick detachable, £3/17/6. Milford Herald, £6/6.—Stamford Hill Motor Co., 128, High Rd., Tottenham. Phone 1982 Tottenham.

SIDECARS.—A postcard will bring you illustrated list of the best, cheapest, and most up-to-date sidecars on the market, delivery from stock, trade supplied.—Jack Cairns, sidecar and fittings manufacturer, Gillingham St Works, Preston.

MONTGOMERY Rigid Coach-built Sidecar, built to special design, tripped body, child's removable seat, specially sprung, very smart and comfortable; cost £16/10, accept £10/10 or nearest offer.—No. 8,591, The Motor Cycle Offices, 20 Tudor St., E.C.

PHENIX Sidecars.—The makers of the famous Phoenix motor bicycles are making Phoenix sidecars of high grade from 25/5 nett, complete with tyres; fitted free; sidecars on hire, exchanges made.—Phoenix Motors, Ltd., Motor Cycle Depot, 736, Holloway Rd., London, N. Phone: 449 Hornsey.

SIDECAR COMBINATIONS.

TWIN 5 1/2hp. 2-speed and Sidecar; what duocar.—21 Lime St., Southport.

1910 7 1/2hp. V.S., 2 speeds, Fulford sidecar; cheap.—Particulars, A. Batty, Little Hulton, Bolton.

7hp. V.S., 1910, and Chater-Lea sidecar; any trial; £38.—Maynard, 47, Maidstone Rd., Bounds Green, London.

5 1/2hp. Rex and new Sidecar, free, Stuaely, Amac, Bosch; £22, or separate.—Chandler, Kensington, Berenooks.

1911 4hp. 4-speed Osborne-Jap, with sidecar, excellent condition; £36.—A. 221 Streatham High Rd., S.W.

4 1/2hp. Twin Minerva, free engine, perfect, also new sidecar; see other advertisement.—59, Binfield Rd., Clapham.

3 1/2hp. Minerva, Chater-Lea, sidecar, perfect; bargain, £21; open to expert inspection.—40, Egremont Place, Brighton.

2 1/2hp. N.S.U., reliable, light, detachable sidecar, 4 spares; £14.—May, 14, Donald Rd., Upton Manor, West Ham.

SIDECAR COMBINATIONS.

32 h.p. N.S.U., Bosch magneto, B. and B., with sidecar, perfect condition, spares; £24.—Taylor, 104, Beech Rd., Stockport.

1911 (March) 2-speed Humber and rigid sidecar, under 1,000 miles, new condition; £40, lowest.—Spencer, Linden Cottage, Sevenoaks.

P. and M., 1911 Colonial model, and sidecar, 2-speed gear, hand and foot controlled; £60.—11, Arundel Gardens, Winchester Hill, N.

BRADBURY and Sidecar, 1911 Tourist model, guaranteed perfect condition, all accessories; sacrifice, £39.—Lunnon, 40, Chalk Farm Rd., N.W.

TRIUMPH, 1911, free engine, splendid condition, and new Mills-Fulford radial spring torpedo sidecar; accept £57.—621, Poleshill Rd., Coventry.

ROC, 6h.p., 2-speed, handle starting, 650x65 Dunlops, magneto, spring forks, Amac and Oakleigh sidecar; £25.—Jordan, 49a, Cambray Rd., Balham.

6h.p. Twin Sarcles, Druids, B. and B., h.b.c., adjustable pulley, low saddle position, and almost new sidecar; £18/15.—85, Church Rd., Willesden.

7h.p. 1910 V.S. and Sidecar, new tyres, Whittle belt, splendid condition, fast and reliable; £37/10, a bargain.—Fond, 349, West End Lane, Hampstead.

3h.p. Quadrant and Sidecar, dry battery ignition, h.b.c., good tyres and quantity spares; £16.—Bennett, King Alfred Rd., Harold Wood, Essex.

4h.p. Twin N.S.U. and Sidecar, accumulator ignition, in perfect running order; £19; trial any time; cash wanted.—31, Allen Rd., Stoke Newington, N.

6h.p. N.S.U., appearance and condition as new, a.c.i.v., N.S.U. 2-speed gear, Bosch, 14in. belt, 2 1/2 in. tyres; £33, without sidecar.—189, Bowes Rd., New Southgate.

3h.p. Kerry and Sidecar, with box under, splendid order, exhaust whistle, lamp, 2 accumulators, etc.; £14; seen appointment any time.—S., 72a, Mare St., Hackney, N.E.

BRADBURY Motor Cycle and Sidecar, 2-speed gear, complete, speedometer, lamp, and accessories, new August, 1911; £60.—Waugh, 15, Aspley Rd., Wands worth.

31h.p. White and Poppo, Chater frame, good tyres, 2 new belt, lamps, etc., with Chater sidecar, first rate order; £15.—Symons, 62, Bridport Rd., Thornton Heath.

31h.p. Rex and sidecar, adjustable pulley, B. and B., 2 brand new tyres and Whittle; genuine bargain, £13/10; also Triumph, £15.—Rosedale, Grove Rd., Hounslow.

9h.p. Bat and Sidecar, fast and powerful machine, car tyre on rear wheel, Albion free engine clutch, Whittle belt, Amac carburettor; £45.—Fond, 349, West End Lane, Hampstead.

6h.p. Sarcles and Sidecar, new tyres and tubes, adjustable pulley, spring forks, B. and B. carburettor, excellent condition; £22.—Stubbs, 20, Sutherland Ave., W. Tel.: 2530 Paddington.

1911 Clutch Triumph, N.S.U., 2-speed gear, many accessories and spares, Millford sidecar, with carrier; cost over £75, accept £60, or nearest, or exchange twin.—8, Egypt St., Warrington.

7h.p. Indian, 1911, free engine model, blue finish, complete with Mills-Fulford rigid sidecar, fitted with hood and luggage board, G. and J. tyres; what offers?—Fond, 349, West End Lane, Hampstead.

TO Clear: taken for debt.—5h.p. V.S. and sidecar, French grey, Bosch magneto, Mabon free engine, perfect running order; worth £37, accept quick sale £25.—Brown, Gloucester Rd., Chesterfield.

BRADBURY, 3h.p., Roc 2-speed, with Premier coach-built sidecar, excellent accessories, new, not ridden 250 miles; would entertain 2-seater car, immediate.—Earl, Waldeck, Edward Rd., Birmingham.

ROC Cycle, with Sidecar, 5h.p. Peugeot engine, twin c.v.s., magneto ignition, 26x2 1/2 Palmer cord tyres, in very good order, general condition excellent; owner got a car; would sacrifice for £30.—12, The Broadway, Maswell Hill.

1911 Genuine 2-speed Bradbury and Sidecar, purchased new middle of season, run about 1,800 miles, is fitted regardless of cost, perfect condition; bargain, £45, no offers; seen by appointment.—102, Ballingdon, Sudbury, Suffolk.

SINGER, 3h.p., clutch model, and sidecar, perfect turn out in every respect, new in May, all possible spares, Palmer cord, Cowey King of the Road, valve, etc.; cost £70, take 50 guineas and no less.—10, Beech Av., Sherwood Rise, Nottingham.

1911 3h.p. 2-speed Premier and Chater sidecar, Dunlops, Whittle, 2 Lucas lamps, Lucas horn, speedometer, and all spares, everything as new; any trial given; £65, or without extras £56.—Boyce, 23, Grand Parade, Archway Rd., Highgate.

1910 Rex, 5h.p., 2-speed gear, free engine, new tyres, Whittle belt, automatic lubrication, Lucas headlight, new Chater-Lea sidecar, all accessories, guaranteed perfect and ready for road; £35.—Masters, 7, Shakespeare Rd., Herne Hill.

HUMBER, 2-speed, 3h.p., new last year, just overhauled by Humber, Coventry, worn parts replaced, making machine equivalent to new, with Millford sidecar, 2 almost new tyres, accessories; £38/10 for immediate purchase.—A. Clegg, Arncliffe, Southwood Av., Bourne-mouth.

Silence and Silencers.

THE Brooklands Automobile Racing Club has issued a notice to all motor cycle manufacturers and *habitués* of the track, that in future no motor cycle will be allowed on the track without an efficient silencer, and that cut-outs will not be permitted. This regulation has been brought about by residents of Weybridge, who, we understand, have gone so far as to apply for an injunction against the B.A.R.C. unless steps are taken to reduce the noise of motor cycles. In the long run, the regulation, if upheld, will prove beneficial to the pastime, because it will cause makers to turn their attention to silencing the exhaust. The only criticisms we have to offer regarding the rule are that we believe an exactly similar one exists in connection with cars at Brooklands, which, in our opinion, is more honoured in the breach than in the observance. The racing cars one both sees and hears at Brooklands may have no cut-outs, and the box into which the exhaust gas is blown may be of the orthodox shape and dimensions, but it is seldom, if ever, a *silencer*. Also the authorities encourage the use of aeroplanes as an attraction, but, as everyone knows, the aeroplane engines are totally devoid of any form of silencer, the exhaust issuing in one continuous Gatling-gun-like rattle. This being so, why should the motor cycle be singled out for special attention? We think it is because the rapid explosions of a highly-tuned single-cylinder racing engine are more irritating to the nervous ear than the continued louder rattle of a four or more cylindered car or aeroplane engine.

This brings us to another most absorbing query. How many cars or motor cycles would accomplish the

speeds they attain at Brooklands were they efficiently silenced? A manufacturer may rightly claim perfect silence for a touring car fitted with the same sized engine he employs at Brooklands, but put that touring vehicle on Brooklands track, change the body and some parts of the engine, set the timing of valves for racing only, and note the difference in the noise. The same thing applies to a motor cycle, with this exception, that nearly every motor cyclist would reject a motor cycle as under-powered if it were handed to him with the same adjustments that the touring car owner is satisfied with.

Apart from the question of inadequate space in which to fit a silencer, it is the craving for utmost speed and power which makes the majority of motor cycles noisy when compared with cars. Our opinion is that makers will have to discard the question of appearance in connection with this one item—the silencer—and fit a large and unsightly instrument to deaden the noise of the explosions, or legislation will step in before long and do it for them. Far better to adopt some improvement in this direction at once than wait till it is done for us. If legislation should define at some future date the dimensions and design of the silencer, it would probably err on the side of absurd size, and be of such a shape that the manufacture of a presentable-looking machine would be impossible. There is no valid reason, beyond that of appearance, why a single or double silencer should not be fitted on the chain stays with a single or branch pipe lead under or at the side of the crank case. Who will be the first to adopt it? Silent machines are said to be dangerous, but we cannot trace any accidents to this cause, whilst there have been more than one due to noise.

Large Twins v. T.T. Singles.

A COMPARISON.

ONE frequently hears the remark, "Why do motor cyclists use 8-10 h.p. machines when $3\frac{1}{2}$ h.p. T.T. mounts have proved themselves only a few seconds slower in hill-climbs and short distance speed tests?" Having owned and ridden both types, and toured extensively, I propose to compare their merits and disadvantages. The average motor cyclist will possibly ridicule the idea of employing an engine of 8 h.p. for solo work, apart from the racing track. He, no doubt, finds that his single-cylinder mount of moderate power will take him almost anywhere at what he considers a reasonable speed.

Now my remarks are addressed not so much to the twenty-miles-an-hour tourist, but rather to the more sporting type of rider—or shall we term him the speed merchant?—who revels in a burst uphill with the wind whistling past his ears.

Having always been an admirer of power, both physical and mechanical, and at the same time having been bestride motor cycles developing from one donkey-power to twenty horse-power, I must confess to a leaning to the big twin-cylinder, but I will deal quite openly with the advantages and disadvantages of what to some minds appear as "abnormal projectiles."

The Comfort of Big Twins.

In the first place, let us consider comfort combined with speed, as this will without doubt appeal to any contemplating a long journey with limited time at their disposal. With large tyres (by this I mean tyres not less than $2\frac{1}{2}$ in. in diameter), and with a wheel-base a little longer than standard practice, no rider can realise the extraordinary increase in comfort to be obtained until he has experimented for himself. At the same time, the small increase in weight entailed by using larger tyres and a heavier frame does not appreciably slow a machine with a large reserve of power.

Experienced readers may perhaps agree with me that it is an unpleasant undertaking to drive a T.T.

single for any length of time at speed, after riding a large twin at an equivalent speed under exactly similar road conditions. In the case of the single the throttle is open almost to the full and the engine turning at quite 3,000 revolutions per minute. Compare with this the twin running comparatively light at a little over 2,000, with a gear approaching 3 to 1. Ignoring the question of comfort, the high engine speed leads to overheating. For instance, the single, when picking up after slowing for traffic or a corner, invariably utters an ominous "knocking" which grates on one's ears, whereas the "eight," with its two cylinders by no means "pink hot," picks up without a murmur and is soon settling down to its stride again.

Another Advantage of Reserve Power.

A point greatly in favour of the larger engine is that when once tuned up it requires little attention, owing to the improbability of one being able to "let it out" for any distance. The T.T. single has undoubtedly been developed almost to the last notch, and has proved itself wonderfully speedy when in perfect tune, but the question is, "How long does this tune last?" Again, as regards reliability at speed, one rarely hears of the big twin being stopped on the road owing to valve troubles, for the reason already stated, viz., that the engine is not being forced along and is rarely turning at its maximum revolutions. How many riders of T.T. single-cylinder machines of even six months' experience can assert they have had no valve troubles?

As winter is rapidly approaching, probably still fewer would care to tackle a powerful mount on the score of side-slip. But against this there are many who "lay up" their smaller mounts for a few months, owing to their dread of skidding, so we will cry quits here. But to my mind the liability of side-slip depends on two things—firstly nerve, and secondly gear ratio. Provided a low gear be used on really treacherous surfaces, I can see no reason

A. Mackenzie-Cott, the writer of the accompanying article.

The machines with which he is depicted are (left) a 1911 8 h.p. J.A.P., and (right) a 1911 T.T. Triumph.

Large Twins v. T.T. Singles. —

to believe that a large twin should skid more readily than a single; in fact, I will go further, and state that the tendency is less likely, owing to the more even torque of the twin-cylinder engine. My practice is to arrange the throttle to close fully, and to control the speed of the machine by the throttle, and not by the switch or exhaust lifter.

The Question of $\$$ s. d.

To come to running costs, I must admit that an undoubted disadvantage of the large power unit is the comparatively high expenses, especially in relation to petrol, tyres, and belts. In the case of the twin, the cost of upkeep I find to exceed that of the single by thirty per cent. But, in my opinion, this extra expense is money well spent in obtaining a more luxurious method of travel.

Lastly, with regard to hill-climbing power, I contend that the close results of competitions are misleading, and tend to give one the impression that the single is quite as fast and every bit as good a hill-climber as its larger brother, which most emphatically is not the case. Why? Because most really stiff hills possess either dangerous corners or a loose and rough surface, and cannot be ascended with safety at more than a certain speed, however great the power may be, and this limit speed the single in expert hands is often capable of attaining. On tour the conditions are totally different, and the high geared twin-cylinder machine will negotiate severe gradients at a speed quite beyond the powers of the single-cylinder with its 4 to 1 gear.

A. MACKENZIE COTT.

THE AUTUMN QUARTERLY TRIAL.

BALL OR ROLLER BEARINGS.

FOR some time past many motor car front wheel bearings have been fitted with the type of roller bearing which is known as the Timken taper roller bearing. They are also being fitted to back wheel bearings of motor cars. Unless we are very much mistaken, more than one high-grade make of motor bicycle will be provided with these bearings next year. They are not cheap, however, and any firm fitting them must have found an appreciable difference in running, or they would not add a matter of a couple of pounds to the cost of a machine merely to have an additional "talking point."

Section and sketch of the Timken roller bearing.

The appended sketch of the Timken bearing in section and perspective illustrates the amount of

bearing surface occupied by the rollers. Most roller bearings are not adjustable, but the Timken is adjustable in exactly the same way as an ordinary ball bearing, namely, by means of a cone. In the case of motor cycle wheel bearings, this cone is adjustable by means of a screwed thread and locked with a nut, so that there is no possible reason why there should be the slightest side play in the wheel bearing; in fact, when perfectly adjusted, there would probably be less than in the usual type of ball bearing. It is a well-known fact among engineers that a ball bearing is not suitable for carrying heavy weights, and has been discarded in many instances owing to the fact that the ball provides a point contact only instead of a line contact.

Whether the weight of a motor cycle and rider is sufficient to bring the undoubted advantages of the roller bearing into prominence in connection with motor cycles remains to be seen, but there is no doubt that on motor cars it has proved itself superior to a ball bearing, particularly in the case of the front wheels. The front wheels of cycles used with sidecars are, of course, subjected to a similar strain in the way of end thrust as a motor car wheel bearing, although the weight carried is less. If the roller bearing for the motor cycle is made of a suitable size and strength for the weight, we are of the opinion that there is a future for it where the expense in producing the higher grade of machine is not studied.

FROM THE CHANNEL TO THE ADRIATIC & MEDITERRANEAN & BACK

By Motor Cycle

By R.M.B.J.

(Continued from page 1086.)

The run was very enjoyable. Passing an old *château* on the right surrounded by a moat and used as a farm, we entered Vitteaux—a quaint old town—and had lunch. Afterwards we struck a very pretty road with splendid panoramic views through Sombernon. A fast run took us through Auxonne, Dijon, and Dole, just stopping in each to buy cards and get a general idea. All the countryside was alive with haymakers, and the slow-moving bullock waggons, heavily laden, are not ideal vehicles to meet and pass. The country now becomes gloriously pretty as we approach the Jura Mountains, but the road deteriorates, and gets very bumpy to Salers-les-Bains, where we stopped for the night, as it began to pour with rain. After an excellent dinner at l'Hôtel des Messageries, we were entertained by a conjurer. 140 miles.

Saturday, July 1st, fortunately broke fine, though

Salins, nestling in the valley below. The roads soon dried up under the hot sun, and ran through a very pretty forest to Levier, but were rather uninteresting to Pontarlier. Passing beneath the gateway inscribed "Liberté, Fraternité, Egalité," into the town, I took a snap of the usual crowd which everywhere surrounded the machines. From Pontarlier right on to the Italian Lakes the scenery beggars description, and the roads are for the most part excellent. Care has to be exercised in negotiating the "cassis" or drains across the village streets. Dropping down a long hillside, with a grand view of valley beneath, we came on the French Customs at Jougne on the right side, and the Swiss, ten yards further on, on the left, at Vallorbe. The French authorities were very bored, and hardly bothered to look at us, except to examine the *permis de circulation*. The Swiss *douane* filled up the International Travelling Pass after much delay. None of the Customs seemed to understand this book, and always asked for the little card with the photograph of the rider and description of the machine. One can get on perfectly with this alone, the other papers proving quite superfluous. Lunching at Ballaigue, we began to drop down for miles, over a splendid road with the most glorious panoramic view it is possible to get in the world. Eighty miles away the snow-capped Alps appear; in the valley, far as the eye can reach, are villages and towns studding the green

An Italian "sign-post" and wayside cross near Venice on the plain of Lombardy.

the *paré* and roads were very greasy at first. Salins is a very pretty town, down in the valley, dominated by forts perched hundreds of feet up on crags on each side. Leaving at 9.40, we were at once faced by a stiff climb of four miles over the Juras. The road surface was tricky and abounded in deep ruts, which made a two-speed gear a *sine qua non*. Halfway up, one gets a glorious view of

The P. and M. in the Swiss Alps. The above photograph was taken in the Simplon Pass.

From the Channel to the Adriatic and Mediterranean and Back.—carpet: every turn in the road brings fresh snow-clad peaks into view, while far away could just be seen the blue waters of the Lake of Geneva. From Orbe to Lausanne the road becomes *very* narrow, bumpy, and dusty, till it drops right down into Lausanne, wherein we just paused, and then ran on through the towns and villages on the lake side, vines all the way above us on the left, the lake below on the right, to Chillon at the head of the lake. We put up at the Chateau de Chillon Hotel, and after dinner explored Montreux and the lake side. The heat had been terrific all day, and towards evening heavy banks of cloud appeared over the lake and mountains, and then a thunderstorm burst in all its grandeur and fury. This was a "no trouble" day, through magnificent scenery. Eighty-six miles.

Improved Roads and Fine Scenery.

Sunday, July 2nd.—Having laid in a stock of petrol overnight, we got going at 11.30. From Chillon, the road runs for seventy miles

CONTINENTAL TOURING ON A MOTOR CYCLE.

The usual crowd looking at the motor cycle at Pontarlier, France.

Buying "essence" (petrol) from the usual grocers' shop in France. The five litre tins can be seen outside, together with the petrol funnel, which is hardly motor cycle size. It will be noticed that the front number of the writer's machine has come adrift.

bother to light up till I reached the town) in the dark, over the greasy roads, with the lightning playing hide and seek in the mountains and the thunder reverberating up and down the valley, to the Hôtel du Terminus, Sierre. Here a concert was in full swing, and the lights and gaiety were welcome after that finish in the dark. By the way, before leaving England I met a motor cyclist who had just returned from the Simplon, and he strongly advised us to take the train from Martigny to Brieg, as there was simply no road. However, the road turned out to be quite fair, though greasy and rutty; 25 to 30 m.p.h. was possible over it with the Kempshalls. Fifty-four miles.

Over the Simplon into Italy.

Monday, July 3rd.—Starting at 9, we found the road in good condition to Brieg. The valley begins to narrow, and one passes through the first typically Italian paved village, and across the quaint covered wooden bridge over the mountain torrent. Arriving at Brieg at 11, we stopped at the police station for our permits to cross the Simplon. A paper is filled in, giving full particulars of machine and rider and specimen signature and exact time of departure from the station. The fee is 2 francs. A copy of the rules for crossing the pass, in French or German, is also handed one. Not less than four hours have to be taken in crossing between Brieg and Gondo (28 miles), where the permit is handed in at the police station and the time noted. Speed nowhere must exceed 7 m.p.h. The fines for breaking these rules range from 25 to

A waterfall near Vernayaz in the Rhone Valley, Switzerland.

500 francs. However, we found it was not so terrible as we had expected, and if one drives

as a gentleman should do, no trouble will result. The pass begins immediately from Brieg, rising steeply, bending to the left, and zigzagging round to the right. The heat was intense; low gear used all the time. Most glorious views are obtained on the way up, broad panoramas, and, far down below, Brieg is visible. Occasional stretches of unrolled stones, the entire width of the road, were rather disconcerting. Passing through the tiny villages of Berisal and Eggen, making a wide sweep round the Kaltwasser glacier and the Simplon.

From the Channel to the Adriatic and Mediterranean and Back.—

Kulm comes into sight (the summit = 2,009 metres). Now come muddy tunnels, and water galleries, with mountain torrents rushing overhead and wetting one with spray, and at last, 13½ miles from Brieg by my Cowey, is the summit and hotel, with snow alongside the road. The rarefied atmosphere makes one breathe rather rapidly, but the carburation seemed quite unaffected. The glorious view is indescribable. Entering our names in the visitors' book, sending off postcards, and then the long, long drop down begins of twenty-six miles to Domodossola. Bending to the left, round the Hübachorn, the Hospice comes into view, with some little St. Bernard puppies playing about. Here we visited the chapel, took photographs of each, and continued. Down below on the right is seen the old Simplon and Hospice, and then the road slides into the gorge, from which it does not emerge until Crévola Dossola. On the Swiss side one gets glorious panoramic views; on the Italian side the route lies in a deep gorge all the way, with the mountains rising sheer thousands of feet up. The leather of my brake band began to burn, and engine compression was used as a brake; the front brake blocks were also very hot. The road now is very loose, big

boulders and stones lying about in all directions, being carried down by avalanches, and in places the road is washed away. Fortunately, it was down hill. Then the police station at Gondo—we had taken seven hours, as we had lunched, photographed and enjoyed the scenery—followed by Swiss and Italian Customs. The Italians affixed a seal to each machine, and supplied us with a *permis de circulation* in four languages (the English is quaint), the fee being 25 centesimi. Everywhere my machine caused wonderment because it had no pedals. The favourite remark was: "It is like a little motor car." Then down to Domodossola; in the plain here we had our first taste of the terrible Italian dust. It was now 8.30, and we decided to go on to Pallanza, as we thought it was only twenty miles on. However, it turned out to be over thirty, and a wild ride too. It was creepy under the trees; once I landed in the middle of a light railway in coming round a bend on to a new road, but luckily recovered myself. At last—Lake Maggiore, with its twinkling lights and islands and the moon over the mountains and lake, the whole blending into a wonderful picture. This was a day of glorious views, which I should like to do over again. Eighty-eight miles to-day.

(To be continued.)

PARIS-RHEIMS MOTOR CYCLE RACE. A FRENCH AWAKENING.

There is no promise of a revival of interest in motor cycles in France. Recently a road race from Paris to Rheims was held—a distance of approximately 100 miles. Our photographs show—(1) The winner Naas (7 h.p. twin Griffon). (2) Second, Bloch (6 h.p. twin Rene Gillet). (3) Gabriel (3½ h.p. T.T. Triumph). (4) Dubois, winner of the passenger class on a 5 h.p. Mototri-Contal. Practically none of the French machines had silencers.

OCCASIONAL COMMENTS

G. IXION

Serviceable Tyre Inflators.

Some months ago I complained of the shoddy character of some tyre pumps. These often have a very small barrel, and when a 26in. tyre has to be inflated from the flat the job requires a multitude of strokes; further, the connection is very light and fragile, and the tube is apt to tear away from its end sockets in hard use.

Since that date I have received two excellent pumps—one a Bluemel, which is larger and stronger than the average; the other is a direct bid for the allegiance of the "heavy tourist" type of rider, and is known as the Vevo. The trade undoubtedly want a light, cheap pump. If they are to sell their machines at moderate figures, they cannot afford to pay high prices for accessories. Too many makers fit toy celluloid pumps, and these suit the T.T. stripped machine, the owner of which probably carries a sternly economised kit in a military hairbrush case, strapped to the front forks. One or two makers fit the Bluemel foot pump, which is a large, light, and excellent inflator. But thousands of riders do not mind a little extra weight and cost, and they will be glad to hear of the Vevo, which is a really powerful instrument, with a large margin of strength and magnificent inflating qualities.

Rear Springing.

How much longer are we to wait for the ideal rear springing device? Completely sprung frames seem to hang fire, weight being the chief drawback, with the fear of rattles and lost rigidity in the background. Various accessory dealers continue to market spring saddle mountings, applicable to all makes of machine, but they do not provide for the springing of the mechanism. Existing spring devices other than one or two well-known types which have been tried and found efficient rather remind me of the primitive spring forks introduced six years ago—they are generally obvious makeshifts, containing a hint of future evolution, but themselves plainly doomed to obscurity. In the meantime we continue to stand on our footrests whenever we near a level crossing, and continue to let air out of our back tyres whenever we strike a long patch of corrugated road. I know the trade have plenty to do, but this is a point that needs attention, and one that will well repay the introducer of a good device.

I rather like a rear springing idea embodied in the 1912 model of the Harley-Davidson machine—a leading American make. The saddle is carried on a horizontal lever; the forward end of this lever is hinged to a clip on the top tube of the frame, while its rear end is fixed to a post in the usual saddle pillar tube, and insulated on compression and tension springs concealed in the tube.

A Stern Test of a Generator.

Last week I took a trip on a car, and as the owner was a little dubious about the reliability of his big acetylene generator, I slipped my 1911 motor cycle generator into the car boot. Sure enough the car generator gave out, and we strapped the little cycle gasometer into position, and used it to supply a brace of giant head lamps for an hour and a half.

The driver of the car was enthusiastic in his praises—said he would have imagined he had a pair of new lamps, for they had never given so excellent a light before. When we got home I emptied the cycle generator, and found it was not quite exhausted. I have never had very satisfactory experiences with the complete cycle set, which goes to show that the lamp is not so good as the generator.

On the car the gas travelled to the lamps through about eight feet of tubing with a steady upward slope, and also through a filter. I believe on some cycle sets the tubing undulates too much, and the levels are not observed so strictly as they should be, while a small filter clipped to the top tube would probably aid in the maintenance of an even light for long periods. One of the essentials is to obtain good carbide, there is a lot of rubbish on offer.

I do not believe in carrying the generator as high as most sets do, nor in dipping the tube between lamp and generator.

NON-STOPS ON FOUR SUCCESSIVE OCCASIONS.

J. and A. J. Stevens, who have made non-stop runs in each of the four Quarterly Trials of 1911, riding 2½ h p. 2-speed chain driven A.J.S. machines.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Stands as Nail Catchers.

[5984.]—The letter of "Never Again" [5923] strikes me as relating to a very peculiar incident. "Never Again" adjusted his stand to clear the tyre by half an inch, and shortly afterwards . . . the bar happened to touch the tyre.

Now what happened? Did the tyre suddenly swell that extra half-inch, or did the "somewhere near 20 m.p.h." cause the bar to be drawn to the tyre by suction?

I should suggest that when "Never Again" adjusted his stand he forgot to tighten up the bolts, or that whilst doing his "somewhere near 20 m.p.h." his tyre picked up a nice large brick which became wedged between the tyre and stand.

As the road "Never Again" did his 40ft. slide upon was tarred, I am in favour of the loose bolt theory.

It may interest "Never Again" to know that I run with my stand as close to the tyre as is possible without actually touching. The distance between the two is probably $\frac{1}{2}$ in. Only during the last fortnight my stand has twice given me the hint that all was not well with my back tyre. One occasion was outside Hanwell Asylum (bad omen), and I heard a miniature child's rattle behind me. I thereupon proceeded to extract a small portion of tramline from my back tyre. A nice little splinter about 1½ in. long. The second occasion was when quite an ordinary nail tried to get through my "Autobi." The above mentioned child's rattle soon made itself heard.

HUBERT J. M. HUGHES.

Single-cylinder Machines and Sidecars.

[5985.]—May I have a word on the single-cylinder sidecar machine question?

Many men I know run single-cylinder machines with sidecars. Nine out of every ten agree that their turn-outs are no good for serious touring in a hilly district. They are useful for short runs, knocking (in more senses than one) about town—"pottering," as I call it. For touring over give-and-take roads they all agree that a twin is necessary.

Of course, if a single-cylinder man has a two-speed gear on his machine, so much the better; it will save him much trouble in traffic, and many weary "dismounts and runs" on steep hills. With a single-cylinder and sidecar the engine always seems to be labouring; picking up on corners, climbing hills, etc., all tell their tale. To maintain a good average speed, say 25 m.p.h., the engine runs fairly warm, the result of a low gear and a generous throttle. Then, when the hill comes, these things take their toll. I speak now of ordinary common or garden amateurs with ordinary common or garden machines, not those experts who get their engines tuned up every other month at the works.

Personally, I have driven a single-cylinder single-gear machine and sidecar in a hilly district several hundreds of miles, and thoroughly enjoyed it. It is sport in the real sense of the word. But there is a certain amount of work in the undertaking, and it would not suit many men, especially those getting middle-aged. The passenger (especially if a lady) might object if the hills she has to walk up become too frequent. This is when the work starts.

EPH WHY.

[5986.]—Regarding the above discussion, I venture to quote Mr. Hugh Gibson against himself, as in the postscript to one of his letters he says, "Wray and myself weighed just over twenty stones on the record ride." There he gives

the whole case away, because the sidecar combination is obviously rather the machine of the heavy than of the light brigade, and if I weighed only ten stones instead of eighteen I do not think I should even trouble a sidecar.

Let all interesting purchasers of sidecars take warning that if, like Mr. Gibson, you are as expert at keeping in tune, as you are at driving and only wish to carry twenty stones a hefty single and two (or three) speed gear will do you all right, but if you are not quite as expert as Mr. Gibson and want to carry twenty-four stones you must have something higher-powered or be constantly in trouble in any (at all) hilly country.

My 7 h.p. twin with two-speed gear takes thirty-two stones up the Kent hills including Westerham, Titsey, Riverhill, Charing, etc., without either of us having to dismount, and we have recently returned from a tour in Devon and Cornwall, and were only stopped on one or two hills by belt slip, but it was just about all the machine could do, and I am quite sure the hefty single with two or even three-speeds would not have done it.

In a nutshell—the power must be suited to the work to be done if you do not want to be in constant trouble. But all the same I do not recommend every rider who wishes to carry twenty stones to assume that what Mr. Gibson can do he can do. Those who are sufficiently expert may do it—the others will not.

J.E.Y.

Overheating.

[5987.]—In one of your July issues, under the heading of Questions and Replies headed "Overheating," you state as follows:

"Too weak a mixture is also quite as likely to cause overheating as too strong a mixture."

Now I do not want to contradict this statement, but only desire clearer information on the subject.

It appears to me that when there is exactly sufficient oxygen present in the mixture entirely to burn all the petrol gas present, or in other words when there is just sufficient petrol gas present in the mixture entirely to consume all the oxygen present, not only is the maximum explosive force generated, but also the maximum amount of heat is produced.

Beyond this point on either side, the explosive force and also the amount of heat generated will be naturally reduced.

Should an excess of air be present this will not be consumed during the explosion, but will be expelled through the exhaust along with the products of combustion in a heated state, having absorbed part of the heat generated during the explosion, thus the temperature of the exhaust gases will be less than if they had been the result of complete combustion.

It thus appears to me that the greater the quantity of excess air present in the mixture the less will be the force of the explosion, and the lower will be the temperature of the resultant gases, consequently less heat will be conveyed to the cylinder and its parts, until eventually a point is reached when the mixture will cease to explode at all.

A similar thing would occur when an excess of petrol gas is present, i.e., more than the oxygen in the mixture could consume; this excess would be unconsumed after the explosion, and be expelled in a heated state along with the products of combustion, having absorbed a portion of the heat generated during the explosion, hence the temperature of the resultant gases would be less than if they had been produced by complete combustion.

Both the force of the explosion and the heat generated would diminish as the excess of petrol gas increased until the mixture ceased to explode as before.

If the above reasoning be correct how it is possible that either too much or too little air can generate more heat than a maximum explosive mixture giving complete combustion?

B. STARKS FIELD.

[It is certainly a fact that too weak a mixture causes overheating, or—perhaps better expressed—coking and bad running due to poor explosions. Bad running always makes the engine hotter than it should be under the circumstances, hence it causes overheating.—Ed.]

Lamps and Winter Riding.

[5988.]—To be overtaken by darkness when within a few miles of one's destination, and to find that one lacks either calcium carbide, water, or matches is a most annoying experience. For some months the writer has carried an accumulator for lighting purposes, but the trouble of finding a charging station running twenty-four hours each day, renewal of plates, and acid affected by vibration, has led to the adoption of a Hellenes dry cell, with more satisfactory results.

This spring a Voltalite magneto electric generator was purchased, but I found that the vibration of the front forks was rather too much, and the tyre rim quite impractical as a bearing surface for the generator pulley, as the rim was frequently clogged with mud and dirt.

On the first of last month I purchased another one, and lengthened the flexible conducting wires to 4ft., discarded the lamp springing device, and attached the lamp direct to the clamping base of the lamp holder.

The generator was then attached to the frame back fork stay, so that the rubber covered generator pulley might bear upon the under side of the belt pulley where the peripheral speed is less and more suitable than the rim of the wheel, also it is kept clean by the brake shoe.

One could easily have several electric lamps with a generator which would occupy no more space than the one acetylene generator and lamp, while the extra weight entailed and power absorbed are not worthy of consideration.

The above motor cycle travelled 1,300 miles last month, and the only fault was the breaking of three reflectors (replaced free of charge by the makers) close to the lamp base. The original metallic filament lamp and rubber faced generator pulley are still in service.

I still carry a dry cell which is switched on when the machine is standing, the cell being carried on the forward end of the footboards, protected by the aluminium air scoop and mud shield on the opposite side from the acetylene generator.

It took years for the magneto to supplant the accumulator for ignition purposes—now let us have it for lighting purposes.

H. W. TURNER.

The A.C.U. and the Liverpool A.C.C.

[5989.]—I should like to endorse the remarks made by your correspondent E. W. Karkopp in reference to the action of the A.C.U. in refusing to grant a permit to the Liverpool A.C.C. for the holding of an open reliability trial, and also, for its subsequent and apparently futile efforts to prevent the trial being held.

He refers to a meeting constituted of various club delegates that should be held in order to discuss the whole question, and concludes his remarks with an appeal to the Northerners to wake up.

This is a matter that affects us Midlanders also, and I think I should be safe in saying that if any organised action be taken almost all the provincial clubs would support the movement in a body.

The treasurer of my club informs me that this year he will pay over £20 for affiliation fees to the A.C.U., and this is being paid apparently to support the A.C.U., when it steps in and says that certain competitions shall not be held, and so attempts to frustrate and destroy the sporting element upon which many of the clubs have built up good reputations, and for which fully ninety-five per cent. of the members join their local clubs.

It is time that this sort of thing was put a stop to. We are towards the end of the competition season now, and club committees will have more time to talk the matter over and form their plans for next year, but before any

gathering is held or a meeting of provincial clubs' representatives takes place I would urge that full and due consideration be given and that a free interchange of opinions between club officials be made.

The next few weeks will, no doubt, show the feeling of the provincial clubs on the matter, and I trust will go a long way towards settling matters right after so many arguments and expressions of opinion have taken place.

Till then, I urge that no plans for a meeting take place, as the time seems hardly ripe.

HOWARD SMITH.

Hon. Secretary, Sutton Coldfield A.C.

[5990.]—I have carefully read the correspondence regarding the attitude of the A.C.U. in banning the Liverpool A.C.C. two-days' trial, and the Harrogate Club's recent trouble, and, as one who is keenly interested, I shall be obliged if you will allow me to point out the futility of any further efforts to influence, persuade, or coerce the A.C.U.

In 1907 a determined effort was made to reform the then Auto Cycle Club by a committee of eight Northern motor cyclists, but without any material effect except to alter the name to the Auto Cycle Union. It was not until Easter, 1909, when the Scarborough M.C.C. originated the Staxton hill-climb and asked for entries from other clubs, that any real good was done. At that hill-climb twelve Northern clubs competed together, although the A.C.U. proclaimed the event. All competitors being suspended *sine die*—84 in number—brought into the minds of a few the idea of a Northern League of Defence and not Defiance, so that friendly competitions might be held amongst neighbouring clubs without paying exorbitant fees for permits and licences to an outside body claiming jurisdiction all over the country.

The Northern League was formed, and held hill-climbs at Staxton at Easter, 1910 and 1911, also a Garroby hill-climb and a Harrogate team trial during 1910. The A.C.U. at the end of 1910 sent four representatives to meet the Northern League Council at York, no doubt feeling that something must be done to meet the Northerners, or the A.C.U. would suffer. Mr. H. W. Fortune, of Harrogate, outlined a scheme at that meeting, offering to recognise the A.C.U. as the governing body by paying a lump sum to it, and the four representatives returned to Piccadilly to consider the question. I am afraid the subject was difficult to digest, as, to the best of my knowledge, nothing has since been heard of the matter, but evidently the militant attitude of the N.L. Council showed the A.C.U. delegates that something would need to be done, and this year we have had some A.C.U. events brought North.

The Northern League has marked time, hoping that now the A.C.U. was showing itself in the North, the pro-

JUVENILE ENTHUSIASM FOR THE MOTOR CYCLE.
Master Eric and Master Billy, sons of Dr. F. C. Wright, of Moy, Co. Tyrone, who are quite enthusiastic over their father's 8 h.p. Matchless-Jap and Montgomery sidecar, on which they have done some extensive touring.

posals made in 1910 might be considered and a better understanding arrived at. Instead of that, what do we find? An autocratic interference from a no doubt estimable body of sportsmen, but not motor cyclists as we know them, and an interference with the liberties of influential clubs like Harrogate and Liverpool, which I feel sure will not be permitted.

A couple of weeks ago I called a meeting of the N.L. at York, and ten clubs sent delegates, some twenty-two motor cyclists being amongst the number, some of whom had ridden fifty miles to attend the meeting. The Harrogate Club's position was gone into, and eventually Mr. H. W. Fortune, the Harrogate M.C.C. secretary, consented to take over the office of secretary of the N.L., vacated by Mr. Straker.

Mr. Hugh Gibson sent a letter to the League, and urged immediate action, and promised his support in extending the scope of the Northern League. I therefore suggest a meeting at some neutral town, say Sheffield or Manchester, at an early date, when the entire subject can be gone into. If all club secretaries interested will write to Mr. H. W. Fortune, St. James's Chambers, Harrogate, saying where and when they could attend an informal meeting I should be very glad.

JAMES R. KELLY

(Chairman Northern League of M.C., Secretary
Leeds M.C.C.)

Cold Vulcanising.

[5991.]-In reply to "Retread's" enquiry of the 12th inst., "What is cold vulcanising?" the process is as follows: The inside of the new tread and the outside of the cover are well cleaned and roughened; both prepared surfaces are given four coats of a solution made by dissolving pure rubber in benzene, and each coat is allowed to dry before the next is applied. Then a solution is made of twenty-five parts bisulphide of carbon and one part sulphuric chloride. This is applied with a camel hair brush to both solutioned surfaces, and the tread is quickly placed over the cover and pressed down. A chemical action takes place, and the tread and cover form one homogeneous mass which cannot be separated by heat.

VULCAN.

Formulae for Hill-climbs.

[5992.]-With reference to my letter which appeared in *The Motor Cycle* of October 5th regarding hill-climbing formulae, I regret that I should have made the misstatement which you pointed out, but at the same time I beg leave to point out Mr. W. Woodward's letter, which draws attention to a similar slip in your article on page 977 of *The Motor Cycle* of September 21st.

[Mr. Colin Macmillan's statement referred to as incorrect is as follows: "Wind Resistance.—The power required to perform this function is proportional to the square of the speed, or, in other words, the force necessary to overcome wind resistance is proportional to the speed." The statement in our article is: "The air resistance varies as the square of the velocity." This is not a "similar slip"—in fact, it is not a slip at all, but perfectly correct, as Mr. Macmillan will see if he reads Mr. Woodward's letter and our comments on it a little more carefully.—Ed.]

Turning now to the example I gave, you state that a 4 h.p. engine could propel the said machine up a mile of 1 in 12 at a speed of nearly 50 m.p.h., and at this speed the wind resistance absorbs 5 h.p. If this is so, then the engine would require to develop something like 9 or 10 h.p., for the weight lifting would then take 3.9 h.p. and windage 5 h.p., and if we allow $\frac{1}{2}$ h.p. for belt and tyre friction we would get a total of 9.4 h.p. This is a power which I hardly think the average 4 h.p. engine is capable of giving out, even under hill-climbing conditions. Suppose the engine even gave out 7 h.p., then this leaves only 2.6 h.p. for wind resistance, which is little more than one-third of the total power given out by the engine. The steeper the gradient and the slower the machine runs, the smaller does the proportion of power absorbed by wind resistance become and the greater the power absorbed by weight lifting. With a gradient of 1 in 8 and speed 40 m.p.h. the proportions would be as follows: Weight lifting $4\frac{1}{2}$ h.p., tyre and belt friction $\frac{1}{2}$ h.p. = $5\frac{1}{2}$ h.p., and if the total power be 7 h.p., then we have $1\frac{1}{2}$ h.p. for wind resistance, i.e., about one-quarter of the total power.

I think your estimate of the area presented to the wind is too liberal. Probably 3 sq. ft. would be nearer to the

effective area presented to the wind by a motor cyclist in a hill-climbing competition with his body flat along the tank, when one considers that such things as frame tubes, tyres, rider's shoulders, head, and legs all present rounded surfaces to the wind which have much less resisting effect than flat surfaces.

As regards the h.p. formula, I think most people admit that rating engines by capacity (or ND^2S) unduly favours the short stroke engine, and that the ND^2 method favours the long stroke engine. In this connection I would refer you to the article which appears in *The Autocar* of October 7th, page 629, "How Stroke affects Horse-power," which confirms my contentions.

COLIN H. MACMILLAN.

[Respecting horse-power, it should be noted that, taking Mr. Macmillan's estimate of 3 sq. ft. effective area (the shape of front surfaces makes but little difference), the horse-power required to overcome air resistance in Mr. Stanhope Spencer's ride at Brooklands when he covered a lap at upwards of 66 m.p.h. would be 7 h.p. The air resistance formula is $.005 Av^2$ ($v = \text{m.p.h.}$); to get the h.p. this must be multiplied by the velocity in feet per second and divided by 550. The resistance of the tyres on the track would consume 1.2 h.p., and probably 20% of the b.h.p. would be lost in transmission. This gives the b.h.p. as 10.25. We do not agree with Mr. Macmillan's last paragraph. We gave an instance to prove that our formula

did not favour the short stroke ($\frac{D^2N}{2.5}$, the R.A.C. formula, certainly favours the long). In his article on "How Stroke affects Horse-power," Mr. Napier deprecates the use of a stroke-bore ratio being introduced into a h.p. formula.

He is alluding to Mr. Poppe's formula $\frac{DSN}{16}$, but we fail to see how this confirms Mr. Macmillan's contentions. Also, the formula is not, as we have already pointed out, a h.p. formula.—Ed.]

Up Edge Hill on a Single Speed Sidecar.

[5993.]-Regarding the article in your last issue on a single geared machine and sidecar climbing Edge Hill, it is very entertaining to read that whilst the engine was cooling down the gear was reduced to $6\frac{1}{2}$ to 1.

It first gives one the impression that, owing to the machine being single geared, it was necessary to cool the engine down, and secondly, it shows that a variable gear is really necessary, as the low gear had to be put in before trying to climb the hill.

And what a very laborious method of putting in the low gear. Fancy, in these days of variable gears, adjustable from the saddle, a rider having to alter his pulley by hand and shorten his belt in order to climb a hill, and then to have to reverse the operation before starting for home. I think that few sidecar passengers would stand being held up for such archaic methods. But that by the way. My point is (and the variable gear man will have grasped it in a flash) that, though the article is supposed to be on a single geared machine, it was to all intents and purposes a "two-speeder."

ZENITH MOTORS, LTD.

W. G. BOWER, Managing Director.

Wear of Big End Bearings.

[5994.]-I have long been an admirer of your contributor "Ixon" by reason of his perfect grasp of the obvious, but I think when he dismisses the subject of the rapid wearing out of the big end bearings of modern engines with the platitude that "it's the pace that kills," he entirely fails to grasp the seriousness of the situation.

I have a $3\frac{1}{2}$ h.p. single of well-known make which has now done 4,400 odd miles, and the third big end bush is now audibly worn. Surely if makers turn out machines capable of 60 m.p.h. they should stand up when driven at about 45 m.p.h., which is about my maximum speed under touring conditions?

The makers of my machine (to whom I have addressed several pained remonstrances) take the matter quite coolly, and evidently do not see that I have any grievance. I believe this particular make is rather exceptional in this respect, but it is a fact that the average T.T. single only does 4,000 to 5,000 miles on one big end bearing. I respectfully submit that this is not as it should be.

JOHN KENNEDY, JUN.

Hill-climbing.

[5955.]-If any of your readers be in search of a new hill to climb, I wish to suggest a trial of the road which runs from Pont Elyan, which is at the upper end of the top reservoir at Rhayader, to the old Aberystwyth coach road. From Rhayader a preliminary test, to weed out those who have no chance, can be made along the old Aberystwyth coach road, which leads to the top of the test hill. A. C. V. GIBSON.

Single-cylinder Records.

[5996.]-By my innocent query in your issue of the 12th inst. I seem to have unwittingly trodden on the Indian toes, for which I am, of course, abjectly contrite; but, referring to the Hendee Co.'s reply to, or rather comments on, my query, I fail to see why, because for three weeks in the early part of the summer I was connected with the clerical staff of the firm, I should *ipso facto* find myself conversant with all subsequent achievements and aspirations of the single-cylinder under discussion. ARTHUR M. C. SCOTT.

Carbon Deposits Analysed.

[5997.]-There is apparently a difference of opinion among experts as to whether the so-called "carbon" deposit produced in cylinder and on piston heads is partly or entirely due to road dust drawn into the compression chamber *via* the extra air orifices.

Having occasion some days ago to remove some of this deposit from the cylinder and piston of my machine (3½ h.p. Triumph), I took the opportunity of making an analysis of the sample I obtained, and append results herewith: 100 parts deposit contained carbon, 58.9 parts; partly carbonised oil, 16.5 parts; silica, 6.07 parts; iron, 9.4 parts; calcium (lime), trace.

Since the previous deposit had been removed, I had ridden 1,200 miles on very dusty roads, giving half a pumpful of Vacuum B every four miles.

From the relatively small proportion of silica and lime compounds, I conclude that road dust is not so largely responsible for the carbon deposit as is generally stated to be the case. D. R. EDWARDES-KER.

[This letter opens up a rather interesting question. Our correspondent writes from Kent, and it is possible the excellent tarred roads of this county are responsible for the absence of dust in the above analysis.—Ed.]

The Trade and the T.T.

[5998.]-Although I am not a member of that august body, the A.C.U., I still am in a position to be aware that the Union has done an immense amount of good towards the improvement of the motor cycle, and, therefore, I view with alarm the stand which you state is being taken by some members of the Manufacturers' Union.

I write in this strain, because I, with numerous other persons who actually do ride motor cycles on the road, have yet to find one particular maker who can get up on his feet and truthfully say, "I have here a machine that will average its thirty miles per hour without failing on some insignificant hill through being over-driven; its valves will keep in excellent condition, neither break nor stretch even if driven for a considerable number of miles at over thirty miles per hour; the cylinder will not require cleaning for at least 3,000 miles; piston rings, gudgeon pin, crank pin, and bushes are guaranteed for 12,000 miles wear; the frame is guaranteed to last for years without breaking; all nuts, bolts, etc., are a perfect fit; and the hubs of the wheels are both waterproof and strong enough for Scottish moorland roads."

Now sir, up to the present the T.T. races (and to a lesser extent the Six Days) are the only events which can really test in a satisfactory manner all the points I mention, and to consider the advisability of running the event on Brooklands is in my mind pure folly, and the reason (irrespective of what I have already written) is, that the results of all races that have been held on Brooklands are only read by the public in an ordinary manner, and very few could tell you a week after the result, what happened to this or that make of machine, but what a difference in the T.T. races. Particulars of machines are carefully noted, arguments are raised as to whether certain parts will stand the strain, the results of practising are studied, and for the race itself, numerous parties of cyclists visit the Isle of Man, and for weeks, months, and even years you will find men who will

bring forward incidents that have happened in races of the past, to prove that this or that machine is better than another, that such a machine was troubled with valves, that so-and-so's back wheel gave way, Jones's pulley broke, Thompson's engine seized, Brown's frame was out of alignment, and such like statements. Take the last races, the first in which variable gears were really tested, and ask yourself if you are satisfied that these gears have reached their zenith, and I think you will agree with me that even if the race was held only to give the gears a chance it would be worth it; but there are heaps of machines, practically unknown, which are only waiting to get a show, and should the perfect makes withdraw they will find that in a year or so the present unknown and despised ones are a power to be taken into serious consideration.

Therefore let not the manufacturers be too hasty, for the public is very fickle and prepared to purchase the goods that are best advertised, and there are more ways than one of advertising in these days of stress. H. W. FORTUNE.

Touring in the West.

[5999.]-I have been much interested in the article, "In Wales and the West." Having myself done most of the ground twice recently, a few comments thereon may be of interest.

It is a fine road from Plinlimmon to Aberystwyth, but if your contributors did it at 45 m.p.h. they risked their lives on the corners, and they are many. I agree with their remarks about Dinas Hill, Fishguard; it is called the worst hill in Wales. I felt quite pleased with myself when I got up on my Triumph without a stop at the first attempt, without lowering the gear. It was not safe to go down at over eight miles per hour, especially with only one brake, as doubtless the spilled man will agree. Part of it is said to be one in four. I should be interested to know how this hill compares with Porlock and Countisbury, which I have not ridden. [Dinas is short in comparison.—Ed.] They do not do St. David's justice, having apparently missed its fine old Cathedral, all down in a hollow sheltered from the Atlantic gales. They had bad luck with their tyres, which bears out the contention that motor cycle tyres are not strong enough. I had a stone go right through a new cover and puncture the tube both sides the other day, which should not be. I always carry a spare butt-ended tube, and if you get a puncture on a dark night you bless yourself that you have it. I certainly agree that a good two-speed is a desideratum, as, while I can generally rush almost any hill on my Triumph, it would be much nicer to be able to go up slowly and safely. There is really nothing more enjoyable than touring the country in this way. TOURIST.

Belts and Bad Weather.

[6000.]-With reference to a letter appearing in your last issue from a correspondent signed "C.F.," we presume that he has not yet heard of the Service belt or he would not make the statement that "an unprotected belt has yet to be invented which will stand a day of rain and filthy roads on a 6 h.p. passenger machine without slipping." We make your correspondent a sporting offer, that if he has a 6 h.p. Zenith we will supply him with one of these belts, and if it slips under the conditions he mentions we should not make any charge for it; the belt, of course, to be kept properly adjusted. THE SERVICE CO. (LONDON), LTD.

**REVERSING THE ORDER OF THINGS.**

A front-driving and front-steering tricar. This somewhat strange looking three-wheeler is electrically driven, of German origin, and called the "Geha." The weight is 13 cwt. and it travels at twelve miles an hour.

Herts. County A.C. Open Speed Trials.

W. F. Newsome (3½ h.p. Triumph), who was the winner in Classes III. and V., Division C, making fastest time of the day.

BY kind permission of Sir Julius Wernher, the energetic motor cycle section of the Hertfordshire Club held a most successful series of speed trials in Luton Hoo Park on Saturday last. A heavy rainstorm detracted from the complete success of the meeting, and caused much belt slipping. Luton Hoo is close to Harpenden, and the way to the park gates was admirably shown by means of arrows. The course started at the park gates, on the Wheathampstead-Luton road, on a down grade, and as soon as the men had passed the banner there ensued a long easy rise, culminating in a fairly stiff curve and a pitch of about 1 in 16. The surface was well-nigh perfect, and was hardly marked by the machines, though during the early part of the event it was very wet.

The park is a particularly pretty one, and the course viewed from the curve, whence nearly its whole extent (1,123 yards) could be seen, formed one of the most beautiful rural scenes which could be imagined, owing chiefly to the lovely autumn tints. Mr. E. B. Dickson (the judge) and Mr. W. Cooper superintended the start, Mr. D. K. Hall took the times near the gate and Mr. F. T. Bidlake at the finish. Mr. C. C. Cooke, the hon. secretary, had his time fully occupied, as when he was not organising he was riding his Triumph in the various classes.

The event began punctually at 2 p.m., and the first three classes were quickly disposed of. During Classes V. and VI. in Division A the rain came down in torrents, and a strong south-westerly wind was blowing. The rain played havoc with the belts, and several suffered heavily in this respect. Some riders were even brought to a standstill. In this and the previous class and throughout the competition Hal Hill's magnificent riding excited favourable comments on all sides. He rode his machine, a 5 h.p. Bat, as if he were part of it, and never, as many others did, switched off at the corner.

In Class VI., for passenger machines, F. W. Barnes (8 h.p. Zenith and sidecar) was brought to a standstill owing to a slipping belt, but G. F. Hunter's performance on a similar machine was quite remarkable. Though at this stage the course was very wet, it was fortunately not slippery even at the corner. By the time Class III. (Division B) was run off the sun came out and the rest of the afternoon was fine.

In Class IV., for any machine, H. Goodwin (7.8 h.p. Blumfield) left the course at the corner and finished his run on the grass, thereby causing no little amusement. Newsome appeared on his Triumph in Class III. (Division C) and gave a splendid exhibition of riding, and later on, in Class V., made the fastest time of the day (40½s.). In this class W. H. Bashall rode Collier's 8 h.p. chain-driven Matchless-Jap, but as it had no rear brake fitted he was disqualified.

The whole event was over by a quarter-past four, and everybody retired to the refreshment tent for tea. The event had been a great success, and was promptly run off

and well managed, but, not content with letting things remain as they were, one of the officials ran off an extra event, which lasted till dusk. Anyone who liked paid a shilling entrance fee and was allowed to ride. Many of the men had no numbers, so that the few onlookers who remained had little idea of what was going on. The timekeepers had to work out the results by the light of a pair of motor car head lights, and were unable to finish announcing them before 6.45 in pitch darkness. Two lady riders took part in the competition, Mrs. O'Donovan (3½ h.p. Singer) in Class III. (Division A) and Miss Hammett (2½ h.p. Douglas) in the extra event.

Division A.

CLASS I.—Any type of standard touring machine. Single-cylinders up to 300 c.c. Award: 1st, silver medal.

	m.	s.
1. J. Dudley (2½ Hobart)	0	51½
2. P. Weatherill (2½ Zenith)	0	52½
3. F. W. Barnes (2½ Zenith)	0	53

Five ran.

CLASS II.—Twin-cylinders up to 343 c.c. Award: 1st, bronze medal.

	m.	s.
C. M. Down (2½ Enfield)	1	4½

Walk over.

CLASS III.—Single-cylinders up to 560 c.c. Awards: 1st, silver cup; 2nd, silver medal.

	m.	s.
1. R. Holloway (3½ Premier)	0	43½
2. E. W. Cheshire (3½ Triumph)	0	44½
3. H. C. Newman (3½ Ivy-Precision)	0	45½

CLASS IV.—Twin-cylinders up to 750 c.c. Award: 1st, bronze medal.

	m.	s.
1. S. T. Tessier (5 Bat)	0	43
2. Hal Hill (5 Bat)	0	43½
3. G. S. Carter (5 Matchless)	0	48

Three ran.

CLASS V.—Any machine. Awards: 1st, silver cup; 2nd, silver medal.

	m.	s.
1. Hal Hill (5 Bat)	0	46½
2. E. M. Cheshire (3½ Triumph)	0	47½
3. C. C. Cooke (3½ Triumph)	0	49½

Eleven ran.

CLASS VI.—Any passenger machine. Award: 1st, silver medal.

	m.	s.
1. G. F. Hunter (8 Zenith and sidecar)	0	50½
2. B. T. Rice Pyle (7.8 Bat and sidecar)	1	5
3. B. Allen Hill (3½ Rudge and sidecar)	1	11

Lister Cooper (3½ h.p. Triumph) who gained first place in Class I. in the Amateur Division.

J. Dudley going well on his 2½ h.p. Hotart.

Division B.

CLASS I.—For amateurs. Open to any type of standard touring machine. Twin-cylinder up to 345 c.c. Award: 1st, bronze medal.

C. M. Down (2½ Enfield) ...	m. s.
...	1 8½

CLASS II.—Single-cylinder up to 560 c.c. Awards: 1st, silver cup; 2nd, silver medal; 3rd, bronze medal.

1. H. Lister Cooper (3½ Triumph) ...	m. s.
2. C. A. Colliver (3½ Zenith) ...	0 47½
3. S. Russell Cooke (3½ Rudge) ...	0 51
...	0 54

CLASS III.—Twin-cylinders up to 750 c.c. Award: 1st, silver medal.

1. G. S. Carter (5 Matchless) ...	m. s.
2. R. L. Printz (4 Bat) ...	0 44
3. J. P. Le Grand (4½ Rex) ...	0 45
...	0 53

CLASS IV.—Any machine. Award: 1st, silver cup.

1. Hal Hill (5 Bat) ...	m. s.
2. G. S. Carter (5 Matchless) ...	0 43
3. C. C. Cooke (3½ Triumph) ...	0 46

Division C.

CLASS I.—Any type of racing machine. Single-cylinder light weights up to 300 c.c. Award: 1st, silver medal.

1. J. Dudley (2½ Hobart) ...	m. s.
2. F. W. Barnes (2½ Zenith) ...	0 51
3. P. Weatherill (2½ Zenith) ...	0 51
...	0 53

CLASS III.—Single-cylinders up to 560 c.c. Awards: 1st, silver cup; 2nd, silver medal.

1. W. F. Newsome (3½ Triumph) ...	m. s.
2. H. C. Newman (3½ Ivy-Precision) ...	0 41
3. H. Lister Cooper (3½ Triumph) ...	0 46

CLASS IV.—Twin-cylinders up to 750 c.c. Award: 1st, silver medal.

1. Hal Hill (5 Bat) ...	m. s.
2. G. S. Carter (5 Matchless) ...	0 41
...	0 44

CLASS V.—Any machine. Awards: 1st, silver cup; 2nd, silver medal.

1. W. F. Newsome (3½ Triumph) ...	m. s.
2. Hal Hill (5 Bat) ...	0 40
3. C. M. Simpson (7 Indian) ...	0 44

Extra Division.**Twin-cylinders.**

1. S. T. Tessier (5 Bat) ...	m. s.
2. C. M. Simpson (7 Indian) ...	0 41
3. F. W. Barnes (8 Zenith) ...	0 43
...	0 44

1. W. H. Elce (3½ Rudge) ...	m. s.
2. H. Lister Cooper (3½ Triumph) ...	0 43
3. J. Cocker (3½ Singer) ...	0 45

Lightweights.

1. J. Dudley (2½ Hobart) ...	m. s.
2. P. Weatherill (2½ Zenith) ...	0 51
3. N. D. Slatter (2½ Alcyon) ...	0 52
...	0 58

W. H. Bashall at full speed on an 8 h.p. chain-driven Matchless just after passing the bend. As will be seen, a number of spectators assembled at this point to witness the corner work.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Oct. 26th	5.45 p.m.
" 28th	5.39 "
" 30th	5.35 "
Nov. 1st	5.31 "

Glen Helen Partially Destroyed by Fire.

Glen Helen, the most famous of the Manx glens so well known to motor cycle visitors to the Isle of Man as the headquarters of various well known firms during the T.T. races, has recently been partially destroyed by fire. Fortunately, the Douglas fire brigade saved the glen from being totally consumed.

The Motor Cycle in Italy.

A 100 kilometres road race was held in the neighbourhood of Turin on October 15th. The course was Orbassano, Brnino, to Piossasco. The contest was divided into classes—engines over 500 c.c., under 500 c.c., 334 c.c., 300 c.c., and 250 c.c. The fastest time was accomplished by Bellorini, 1h. 20m. 15½s.

A.C.U. Autumn Quarterly Trial.

Mr. Harold Pickering, the chief marshal of the above event, asks us to offer his personal thanks to all who assisted on the 14th inst., and especially to Mr. V. Brian Hall, of the Vacuum Oil Co., who lent his Belsize car for the use of officials.

No Speed Limit.

In passing sentence on a motor cyclist who was charged with driving to the public danger at Gainsborough, the chairman (Mr. W. Embleton Fox) said that in Lincolnshire motorists were not prosecuted for exceeding the legal limit, for limits were simply artificial restrictions. But that when cases of furious driving were brought before them they must be taken seriously. A fine of £3 was imposed. This is a commonsense view which we wish was held in other counties, and one which will do much more to put a stop to dangerous driving than traps in open and safe places.

Accident to a Well-known Rider.

A few days ago O. C. Godfrey was driving a 7 h.p. Indian and sidecar to business when a taxicab came out of a side turning and collided with him. Godfrey pulled up immediately, but the cab struck him full, breaking his arm and causing severe internal injuries. The gallant rider was conveyed to the Hampstead Hospital, where he is now lying. Godfrey was shortly to have attempted to lower the hour record, but, of course, all idea of this has had to be given up. Mr. W. H. Wells informed us he will allow no one else to make the attempt. We wish the unfortunate victim a speedy recovery.

Police Trap.

A trap is being worked in the ten-mile speed limit of Stony Stratford. A plain clothes policeman stands in a private garden or leans over the gate, whilst the other constable stands some way up the street with a walking stick in his hand.

Strange Motor Cycle Fatality.

Mr. S. Withers, of Catford, aged 62, was pushing a disabled tricar through Lewisham one day last week, when he suddenly collapsed. A doctor found life extinct. It appears that he had bought the machine second-hand for £17 the same day, and was seen pushing it up a hill between New Cross and Lewisham. A newly taken out licence was found on the body. From enquiries, the machine is a heavy and old type with two bucket seats, and for an elderly man to push such a machine for any distance must prove a severe strain.

A Singular Sight.

Mr. C. H. Hitchen tells us that he saw a very singular sight in the Dales, just above Kirkby Stephen, the other day. The peculiar object approached him at a rapid speed, and proved to be a youthful motor cyclist on a lightweight with a large collie dog standing on the carrier of the machine. Its hind feet were on the carrier and its fore feet resting on the motor cyclist's shoulders. In this manner the pair were proceeding at a speed of 18 to 20 miles an hour.

Many dog owners who are also auto-carists know that their pets are extremely fond of a ride in a car, but we have usually heard of motor cyclists carrying their pets in some form of basket carrier.

SPECIAL FEATURES.

HERTS COUNTY A.C. SPEED TRIALS.

An excellent single-cylinder performance.

1912 MODELS. SOME NEW DESIGNS.

Exhausts on Motor Cycles.

No motor cycle will be admitted to Brooklands unless it is fitted with an efficient silencer, which must not be provided with a cut-out. No form of open exhaust whatever will be admitted. Such is the reading of an order issued this week by Major F. Lindsay Lloyd.

Readers' Experiences.

A sure sign of the advent of the season for ordering new mounts is the sudden jump in readers' requests for others' experiences of certain makes of motor cycles. There were over a dozen such requests under "Experiences Wanted" in our last issue, and eleven this week. Any replies received are forwarded direct to the querist.

The Motor Cycle in Ceylon.

Judging by a cutting from the *Ceylon Times* which has been sent us, there exists at the present time something like a motor cycle famine in that island. Many more motor cycles could have been sold if they were obtainable. One Colombo firm alone, Messrs. Brown and Co., have sold seventy-three motor cycles this year, and the Ceylon M.C.C. has just been formed, the membership already reaching over sixty. All the motor cycles which have been imported have been bought up like "hot cakes," and there is keen bidding to obtain motor cycles from England.

The start of the competition held by the Harrogate and District M.C.C. on the 15th inst. The event included a hill-climb, speed judging (on formula), and a slow downhill run.

A Breakdown Competition.

To-morrow, Friday, 27th inst., the Oxford M.C.C. will conduct a Breakdown Competition at the Creamery Café, Cornmarket Street, Oxford, commencing at 7.30 p.m. This will be followed by an impromptu musical social from about 9 to 11 p.m. Friends of members or others interested in motoring are welcome to the social.

Next Saturday's Inter-club Reliability Trial.

The secretary of the Birmingham M.C.C. informs us that the inter-club reliability trial referred to in "Club News" between the Birmingham and Sutton Coldfield Clubs, has secured a large number of entries from well-known riders. The start will be from College Road, just off the Stratford-on-Avon main road at 2.30 p.m. Twenty-four members of the Sutton Club have entered.

A Record Hill-climbing Expedition.

Last week-end Porlock Hill, Somersetshire, and Lynton Hill, Lynmouth, Devonshire, were climbed for the first time by a motor cycle and sidecar. Frank Smith, who has competed so successfully in all the leading competitions this year, performed this most difficult feat on his 5.6 h.p. Clyno, although the roads were inches deep in mud. He was accompanied in the sidecar by Geoffrey Smith (*The Motor Cycle*), and an illustrated account of the tour, which also included Farlow Bank, Cheddar Gorge, and Countisbury Hills, will appear in our next issue.

Triumph Co.'s Dividend and Bonus.

The Triumph Cycle Co., Ltd., Coventry, have had another excellent year's trading, and show a profit upon the financial year of £73,466 5s. 7d. After adding the balance brought forward from last year's account and providing for repairs, depreciation, directors' fees, etc., there remains a balance of £55,652 10s. The directors recommend a dividend of 15% and a bonus of 1s. per share on the ordinary shares, and to carry forward £8,365 14s. 2d. to next year's account. The shareholders in this company must congratulate themselves on the foresight of the management in adhering to the motor cycle business through thick and thin. It has brought its reward in the shape of substantial profits. Last year's dividend on the ordinary shares was 12½%.

The Trade and the Trials.

At the last meeting of the Manufacturers' Union the committee decided to suggest at the next conference between their committee and the Competitions Committee of the Auto Cycle Union, that manufacturers would be willing next year to support four open events—Spring Quarterly Trial, Autumn Quarterly Trial, Six Days' Trials, and a long-distance race at Brooklands to be held under touring conditions. When the two committees meet the regulations for the above events will be discussed, and it is probable that there will be some alterations to the existing rules for both the Quarterly Trials and the Six Days, as the manufacturers have their own views regarding the way in which these events should be run. Doubtless the opinions of both sides will be of value in formulating rules for the above and similar competitions which should be for the ultimate benefit of the pastime in general.

The Last of the Clubhouse Scheme.

At a meeting which was held at the Service Co.'s offices (Mr. G. W. Mann in the chair), the deposits paid by the provisional committee formed to run the Motor Cyclists' Clubhouse were refunded. Outside subscribers were repaid in full, each member of the committee receiving £1 12s. 9d. for his £2 deposit. Cheques have been posted to all concerned and duly acknowledged.

FUTURE EVENTS

Nov. 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

Dec. 9.—M.C.C. Annual Dinner at the Café Monico.

Dec. 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions

Show Tickets.

Mr. Alfred Bednell, secretary of the Manufacturers' Union, informs us that hon. secretaries of motor cycle clubs may obtain admission tickets to Olympia at half-price for members on application to him at Masonic Chambers, Little Park Street, Coventry.

C. and M.T. Benevolent Fund Dinner.

The sixth annual dinner of the above praiseworthy institution was held at the Connaught Rooms, Great Queen Street, W.C., on Thursday evening last. The chairman was Mr. A. Brampton, J.P. It is interesting to note that Mr. A. J. Wilson, the hon. sec. and treasurer of the fund is one of the pioneer motor cyclists in this country. Though many opportunities for so doing occurred during the evening, only one speaker, Mr. Ernest Brown (Brown Bros.), made any reference to the motor cycle industry. At the conclusion of the function Mr. Brampton announced that the Manufacturers' Union had contributed £200 towards the fund. Several well-known motor cycle traders were present.

The M.C.C. Winter Run.

This event will be held on December 26th and 27th as last year. The speed schedule will be 15 m.p.h., and speeds in excess of 20 m.p.h. will lead to disqualification.

Three Speeds on Farlow Bank.

We are informed by the Sturmer Archer Three-speed Gear Co. that one day last week one of their testers, who is giving the three-speed motor cycle hub gear a thorough testing, was successful in ascending Farlow Bank on a 2 h.p. lightweight Humber with this gear fitted. The low gear took him up comfortably with slight pedal assistance in spite of the fact that the roads were wet.

Notes on the Heris. Speed Trials.

In "W. Cooper's Shilling Sweep" W. H. Elce won the single class, riding his new T.T. Rudge for the first time, having spoilt his late T.T. at the Portmarnock speed trials owing to sand getting in the engine.

The A.C.U. was severely criticised owing to W. H. Bashall being disqualified for only having one brake fitted. This was in Division C. for any type of racing machine.

R. Holloway, again demonstrated to the crowd at Luton Hoo what his Premier is capable of by winning the single class, Division A, up to 500 c.c.

The brothers Bashall accounted for seventeen entries between them, but H. B. only rode in two events. The others had not got their machines ready.

J. Dudley's little Hobart came in for a great deal of comment; it certainly showed an excellent turn of speed.

Will the Triumph Co. standardise the extra air pipe fitted to W. F. Newsome's T.T., on which he made fastest time of the day at Luton Hoo Park?

Indian Wells was congratulating himself over chain drive whilst some of the classes were being run off in the wet.

A great deal of amusement was caused by one competitor being unable to start his engine, although he made several attempts, and at last gave up in disgust, when some "wag" in the crowd shouted, "Why don't you go back to marbles?"

W. Pratt (3½ P. and M.) made his first ride at this meeting in a speed event, but he informed our representative that his machine was too highly geared.

The new 2½ h.p. single-gear light-weight Premier

The New Enfield Sidecar Model.

The Enfield Cycle Co. are manufacturing a new model for sidecar work for 1912. It is fitted with the 6 h.p. side valve J.A.P. engine, with a bore and stroke of 85 by 76 mm. An Amac five-jet carburetter is used, and the ignition is by Bosch h.t. magneto placed in front of the engine.

Method of adjustment of the rear brake.

The well-known Enfield two-speed gear, which has been strengthened to suit the extra power, is employed, and controlled by two pedals situated on the left hand side of the two long aluminium footboards. It is possible that a lever control will be substituted for the pedals, and will be attached to the tank.

The frame is specially manufactured for sidecar work, and has neat lugs brazed solid with it which permit of the sidecar being attached on either side of the motor cycle. A 650 mm. by 65 mm. voiturette tyre is fitted to the driving wheel, the front and sidecar wheels being shod with 26in. by 2½in. tyres. The engine is lubricated by a sight drip feed, actuated by

The new 6 h.p. Enfield sidecar described on this page.

the crank case vacuum, but a hand pump is fitted for emergencies.

Our suggestion for an enlarged silencer for sidecars has been studied, as provision is made for a second silencer below the sidecar. The brakes are more powerful than on most solo mounts, and the tank has a capacity of two gallons of petrol and three

pints of lubricating oil. We had a short run on this new model, and found it flexible, easy of control, and possessed of plenty of power, while we were particularly struck by the ease of steering.

The Enfield Cycle Co. are prepared to manufacture their gears, suitable for belt or chain drive, for the trade.

New Calcott Model.

We illustrate herewith the new 2½ h.p. Calcott lightweight. This is an entirely new model, and has a single-cylinder engine of 63 mm. bore by 76 mm. stroke.

It is fully equipped with stand and carrier, and weighs approximately 100 lbs. The engine unit comprises a gear-driven Bosch magneto with fixed contact breaker

The new 2½ h.p. Calcott lightweight.

carried high up behind the cylinder. B. and B. lightweight carburetter, adjustable pulley, and a neat aluminium silencer. The mechanically operated valves are placed side by side and actuated through adjustable tappets. Druid forks, 26in. by 2in. tyres, and a Lycett saddle are employed, and the tank is fitted with a petrol gauge and injector to the cylinder head. The foot brake is placed below the chain stay, and is operated through a rod adjustable by a right and left handed nut, the pedal being carried on a separate bracket below the footrests.

A Run on a 1912 G.N. Runabout

Owing to the kindness of Mr. George, of the Godfrey and Nash runabout firm, a member of the staff had a most welcome lift from Aston Clinton Hill to his home some four or five miles distant, after the Herts County A.C. hill-climb on October 14th. The little car is fitted with an 8 h.p. J.A.P. engine, and, in spite of its load of three fairly large men, it travelled at a smart pace, and only once required the use of the low gear and that on a sharpish hill. The machine in question has done some 8,000 or 9,000 miles on all sorts of roads so may be considered to have had a fair test.

1912 MODELS.

Advance Details of New Patterns.

Alcyon.

Through the courtesy of Mr. G. N. Higgs we are enabled to give a few preliminary details of the 1912 Alcyon models. The carburettor for next year will be the well-known Claudel-Hobson, or, more correctly, an Alcyon carburettor made under Claudel licence.

The machine will be even more in conformity with English tastes than the few preliminary models which have

been seen over here this year, and, of course, handle-bar control, with wires running through the handle-bar, will be fitted. The handle-bars themselves will have inverted levers, one controlling the front brake and the other the exhaust lifter. The luggage carrier will be more substantial, and a strong and efficient lamp bracket will be fitted.

The 2 h.p. model, which will be practically the same as this year's machine except for the improvements mentioned, will have a variable pulley controlled from the top tube, while a jockey pulley,

The Alcyon front fork springing device.

worked by the foot, will be fitted to keep the belt at the correct tension.

The chief Alcyon novelty will be a twin-cylinder 47 x 72 mm. 2½ h.p. model, the cylinders of which will be situated side by side after the manner of the Werner. Mechanically operated inlet valves will be fitted.

Rushmore Lamp Set.

The Rushmore Lamp Co. claim to have introduced the first of the searchlight lamp patterns with lens mirror—an event which happened some four or five years ago. It was not, however, until the present time that the company decided to place on the market a British made motor cycle head light, following as nearly as possible the successful lines of the Rushmore car lamp.

The lamp differs from the well-known car model in the following respects. Firstly, it is provided with a hood which is attached to the front of the lamp by means of screws, so that it may be easily detached, and a special fixing is supplied. A genuine Mangin lens is fitted, while special notice must be taken of the bracket clips. The face of the clip is circular, with small semi-circular projections cast on it, while depressions to correspond are cast in the boss of the

lamp itself. Both projections and hollows are very small, so that a great number of various positions may be utilised. By undoing the wing nuts the lamp may be placed at any angle, and when the wing nuts are screwed up it will stay in the required position, the projections and hollows preventing any further movement.

The front door of the lamp, carrying the glass in sections in the well-known Rushmore style, is provided with a ventilator which gives out no back light, while the position of the burner is adjustable so that the light may be focussed to suit the wish of the rider.

One of the chief features of the Rushmore lamp is that it is entirely put together by means of screws, thus allowing it to be taken to pieces with the utmost facility.

The generator is simply and strongly constructed, and is much on the lines of their well-known car generator.

The water compartment A has a well formation in the bottom of which lies the

New motor cycle searchlight made by the Rushmore Co.

valve D, which can be easily removed for cleaning purposes, by detaching the nut B which holds it to its seating C.

The pace of the water-feed is controlled by turning the valve rod. The face of the valve has a small taper slot across it, at the broad end of which a hole is drilled into the centre, which is bored out to the bottom. A corresponding hole is drilled in the seat C, so that by turning the valve first the small end of the groove comes opposite the hole in C, allowing a small amount of water to leak through, while a further turn causes the holes to be brought gradually in line, thus allowing a steady stream of water to pass. This, of course, is seldom necessary, unless for lighting up in a hurry.

Round the well lies an annular chamber forming a gas reservoir, the gas entering through holes in the screw plug F. From this reservoir the gas is led through a pipe G in the usual manner.

The carbide is carried in the receptacle H, which is perforated round the lower edge and fitted with a heavy gauge wire gauze bottom. The whole is carried and allowed to swing on the two pins K, fixed to the outer shell L.

The object of this is that the used carbide is sifted through the holes and

gauze and drops into the outer shell. Thus when only part of a charge is used the waste may be emptied away and the lamp is at once ready for use again. The

Rushmore gas generator with shaking grid.

top and bottom halves are held together by the internally screwed ring M, a rubber washer N making a gastight joint.

Three different styles of carrying the lamp are provided for. Firstly, with the lamp in front and the generator close behind; secondly, with a slot behind so that the lamp may be fixed on to the usual type of lamp bracket; thirdly, there is a special carrier on the generator so that the generator may be fitted to a bracket attached to any convenient part of the machine.

A New Quickly Detachable Terminal.

The Rex terminal is one of the quickly detachable type and the invention of their draughtsman, Mr. Sargisson; it is both simple and neat. The cable is placed in the large hollow portion of the jaw, the wire is turned back and the jaw clinched. The terminal is now ready to spring on to the thread of any sparking plug central wire. After the terminal is sprung on the wire of the plug a nut may be added as additional security, but is not necessary. The inventor has had one of these in use for some time and has found it perfectly satisfactory. We believe the Rex firm are adopting it for 1912.

The Rex plug terminal

1912 Models.—

Trump-Jap.

The 3½ h.p. Trump-Jap, which is now being made in Birmingham under the direct supervision of Mr. MacNab, will, so we are informed by the makers, be one of the lightest machines on the market next year for its power. The total weight of the machine unladen will be 170 lbs., and with petrol and oil it will not exceed 185 lbs. It will be exhibited at Olympia for the first time next month and will be enamelled French grey.

A New Motosacoche.

The famous Geneva firm of H. and A. Dufaux have plumped for the long-stroke engine, the dimensions of the 1912 model being 64 by 90 mm. The most drastic change, however, is the wholesale rejection of the chassis or tubular frame, to which were fastened the engine and all the accessories. The engine will in future models be fastened direct to the cycle frame by means of the improved clips, of which we append a sketch. It will be noted that one-half of these clips is cast on the crank case, and threaded through them is a staple which engages the loose

The new quick attachment lug on the 1912 Motosacoche engine. The "chassis" has been discarded.

half, nuts screwed on the ends of the staples holding the lot together. The shields, always a Motosacoche feature, are attached to the tank. The carburettor position is now behind the engine, and a variable extra air control will be employed operated from the handle-bar.

The paraffin injection pipe is led to the side of the piston, so no trouble is occasioned by the paraffin running out through the exhaust valve should the latter be open at the time the paraffin is injected. Square radiator fins of very large size are fitted to the 1912 engine, and it is worthy of note that the 1911 and 1912 engines were tried all out at Brooklands one against the other. The radiator fins of the new model were filed on the edges to enable the engineers of the firm to see what amount of discolouration took place; only one fin showed any sign of "bluing," thereby proving that all the heat was efficiently radiated except at that one point. New and larger filler caps are fitted on the bayonet joint principle, and the carburettor can be flooded for starting by means of a push rod working through the tank from the top and in close reach of the rider's hands.

The cleanliness of the new engine is quite remarkable; with copious oiling it is impossible for the crank case to get dirty, and no oil exudes from any joint.

If an excess of oil is forced into the crank case it issues from the centre of the main shaft, but not a spot comes out at the tappet rods or other vulnerable points. The reason for this is that the makers have a very perfect release valve, which is efficient at any speed at which the engine will work.

An improved lady's model will be ready for the Show, embodying all the above-mentioned special features. An illustration of the new model is published on page 1133.

Chater-Lea.

The Chater-Lea Mfg. Co., Ltd., Golden Lane, E.C., are practically confining themselves next year to their well-known No. 7 three-speed chain-driven sidecar model. This machine has been so successful in competition during this year that very little alteration is being undertaken. A few minor improvements will, however, be exhibited next month, notably a front wheel stand and sidecar stand will be added, also a chain guard protecting the rider's clothes from oil which is sometimes thrown from the chains. The sidecar axle will be cranked to bring the wheels opposite to one another, and the chair will be set three or four inches farther back.

The Chater-Lea runabout will not be sold as a complete vehicle, but the firm intend to place on the market a complete set of fittings which will enable motor cycle engineers to build the vehicle themselves. The following parts will constitute a set: The Chater-Lea twin-cylinder V engine, 85 by 85 mm., with outside cone clutch, the Chater-Lea three-speed gear box with sliding counter-shaft, the back axle with hubs differential and bevel gear transmission, steering gear and front axle but not the frame. The back axle brakes are internal expanding and external contracting, all four brakes on the two wheels. The machine will, we understand, attain a speed of forty miles per hour on the level, and the price of a complete set of parts will probably enable the complete runabout to be sold at £100 to £110 retail. Bosch dual ignition will be provided as an extra if desired.

Grandex.

This firm is marketing for next year three distinct models—the 2½ h.p. light-

weight. 3½ h.p. Tourist or T.T., and a 4½ h.p. sidecar machine. The light-weight will have Jap or Precision engine 70×76 mm. and N.S.U. free engine and two speeds on engine-shaft, and will retail at an extremely moderate figure. The frame will be made with a longer ball head, and the top of the saddle will be only 27in. from the ground. The same machine will also be supplied with 24in. wheels to order when the saddle is only 26in. from the ground. Armstrong hub gears will be fitted if desired, but the N.S.U. will be the standard. The same improvements and alterations apply

The rear wheel of the 1912 Premier sidecar model fitted with Millennium two-speed gear and very broad back mudguard.

to the 3½ h.p. models. The 4½ h.p. sidecar machine has a 90×96 mm. Precision engine and will be sold with fixed gear as standard. The makers claim that with a moderate gear ratio and this large sized engine a change speed gear is hardly necessary, but they propose to fit a clutch hub and will, of course, provide gears at an extra cost.

The new spring frame P.V. motor cycle which is being marketed for 1912 by Messrs. Elliiston and Fell.

1912 Models.—

1911 model 7-8 h.p. 80 x 95 mm. twin Blumfield engine. Observe the large side-by-side mechanically operated valves. One of these engines was recently tested under load for seven hours without artificial cooling.

Buck.

The Buckman Engineering Co., of Sherwood, Nottingham, are experimenting with a light four-wheeled runabout.

A two-cylinder V engine of 90 mm. bore and 95 mm. stroke is employed, cooled by two fans which blow direct on to the cylinder heads and valve ports.

The engine is set across the frame, and behind it is placed a two-speed epicyclic gear. From this the power is transmitted through a universally-jointed propeller-shaft, enclosed in a torque tube, to a neat live rear axle, a spur differential gear being used. Contracting brakes are fitted to each rear wheel, while the makers tell us that by putting both gears into action at once a powerful transmission-shaft brake is obtained. The wheels are shod with 650 x 65 voiturette tyres, and Bosch magneto and Amac carburetter are employed. The machine we were shown had a tubular frame, but in future pressed steel will be used throughout. A bonnet and scuttledash, with two aluminium seats, are fitted. Steering is effected by worm and nut.

While in the works we were shown a three-cylinder rotary engine, with rotary valves. This engine was originally made for aeroplane work, but we hear that a smaller and modified type will shortly be produced for motor cycle work.

P.M.C.

Three new models will be marketed by the Premier Motor Co., of Birmingham. In each case the frames are made by the Rex Manufacturing Co., while the engines fitted are the 4 h.p. single-cylinder and 6 and 8 h.p. twin-cylinder J.A.P.'s.

One of the twins was shown to us, and we were at once struck by the neat and workmanlike appearance of the machine. The Rex two-speed is fitted in the rear hub, and both wheels, belt rim and gear brakes are effectively mudguarded, while the magneto is placed behind the engine,

thus being easy of access and protected from mud.

Special lugs are brazed to the frames for sidecar attachment. The mention of sidecars brings us to the fact that we saw in the process of construction a new model P.M.C. sidecar, the frame of which has a cranked rear cross-member to allow the wheel to be brought in line with the rear wheel of the motor cycle, while the front member is dropped to allow the body to come more to the rear without bumping the frame. We were also shown a neat coach-built torpedo sidecar body, with a side door.

Brough.

W. E. Brough and Co. have produced a very neat and interesting 6 h.p. twin. The two cylinders are set at 50° and have a bore and stroke of 77 by 85 mm. The cooling ribs are tapered off towards the bottom, giving a neat pear-shaped appearance, and an air space is formed between the valve ports and cylinder wall. The valves are mechanically operated and

Arrangement of lamp and generator brackets on the Rex-Jap, which is sold by the Premier Motor Co.

are placed side by side. The operating mechanism is decidedly novel. It will be noticed that only two cams are used to operate the four valves, and the makers claim that, by placing them one above and one below the crankshaft, considerable strain is taken from the bearings. A plat-

form is cast on the front of the crank case to carry the magneto. Concave, flat-topped, or convex pistons can be fitted, thus making the engine suitable for passenger,

Neat aluminium air inlet cover fitted to H. Lister Cooper's T.T. Triumph.

touring, or racing work. We are informed by George Brough that the new 6 h.p. is wonderfully speedy for its size, and that he has his eye on some of C. R. Collier's latest records.

The 3½ h.p. will be increased to 85 by 88 mm., and will have other slight modifications, whilst a 2½ h.p. 75 by 76 mm. lightweight is being introduced. A two-speed gear of the counter-shaft type is also being manufactured for 1912.

S.I.A.M.T.

We should like to add to the description of this interesting Italian motor cycle that, although both valves are situated in the combustion head above the piston, the valve heads cannot fall into the cylinder in the event of a breakage, as two small knobs are fitted to the valve chamber in such a manner that if a valve broke the head would catch the knob and therefore fall no further. The magneto is the "U.H.," not "N.U.," as originally printed, and the combustion head itself is not screwed into the cylinder. It has a ground seating, and it is the castellated ring which screws into the cylinder, so locking the combined valve chamber and top of combustion head firmly in position. Reference to the illustration published on October 5th, page 1042, will render this quite clear.

The 1912 3½ h.p. single-gear Humber.

1912 Models.

Figs. 1 and 2.—Sectional end and side views of the Brown and Hingston gear, showing the position occupied by the screwdriver when the clutch is being adjusted.

Wulfruna.

A call at the Wearwell Cycle Co.'s Wulfruna Works elicited the information that they will market four models for 1912; $1\frac{1}{2}$, $2\frac{3}{4}$, $3\frac{1}{2}$, and 4-5 h.p. types are being manufactured. We were shown the $1\frac{1}{2}$ h.p. which is being made to meet the demand for a real lightweight. It has a single-cylinder vertical engine, with magneto placed behind. The carburetter is an Amac, two-lever type, and both valves are placed side by side. The complete machine with stand and carrier weighs 96 lbs. The larger models (of which the 4-5 h.p. is a twin) have unusual strengthening tubes to the frame. We hear that the firm will have several interesting novelties at the Show which are not yet ready for the public.

Brown and Hingston Improved Two-speed Gear.

This gear was shown at the 1910 Olympia Motor Cycle Show, and has this year been undergoing tests and alterations, with the result that Messrs. R. T. Shelley, Ltd., have laid down a plant for its manufacture in the improved form.

The gear is a somewhat unusual type of epicyclic. The belt rim drum B is driven by the engine, and the power is conveyed to the hub-shell through the expanding clutch I (shown best in fig. 3), normally held in engagement by springs V acting through toggles W. When this clutch is expanded it locks the drum B direct to the hub shell, thus giving a direct drive without passing through gears. On moving the lever P the cone I is caused by a cam action to slide along the spindle L, thus, through rollers U, forcing apart the toggle levers W and causing the clutch I to contract. This gives the neutral position. To bring the low gear into action a fibre-faced brake band is contracted on the drum K, thus preventing the pinion J from revolving. The low gear works as follows: The eccentric portion D, which is driven by the belt rim, carries round with it the internally-toothed ring G. This ring,

which is in engagement with the locked pinion J, consequently rolls round the pinion in the same direction as D, and since the internally-toothed ring has twice the number of teeth possessed by the pinion, it revolves at half the speed of the belt rim B, and as the forward movement of G is transmitted to the hub shell A by small cranks H, the shell A is driven at half the speed of the belt rim B.

The hub spindle is prevented from turning by the end being squared to fit a slotted fork end.

The clutch can be adjusted by turning the screw M, which actuates a micrometer adjustment, so allowing for any wear on the fibre clutch segments. The screw-driver is inserted through a hole in the hub-shell, which is capped. The hub must, of course, be turned until the head of

the screw comes opposite the hole in the hub-shell.

An important feature is that the engine may be started by pedalling with the gear in neutral. It will be noted that there are only two gear wheels in the construction of this hub gear.

Crouch Sociables.

The Crouch three-wheeled sociable has been redesigned for 1912. The power is supplied by a 7 h.p. water-cooled V twin, and is transmitted through a single chain to the rear wheel, after passing through a three-speed gear box, and a leather cone clutch. The engine clutch and gear box, together with a platform carrying the magneto and water pump form a unit which is placed transversely across the frame, close behind the seat. Each part of this unit is bolted rigidly to the next, and the whole forms a neat workmanlike looking job. The gear box has

stationary shafts, on which run hardened steel sleeves carrying the gears, which provide three speeds forward with direct drive on top and a reverse.

The new 7 h.p. water-cooled twin engine on the Crouch Motor Co.'s sociable.

Pivoted to the main shaft is a tubular frame, which is rigidly connected to the rear wheel so that the wheel can only move vertically on its springs.

The frame is of armoured ash, and carries the front axle on full elliptical springs, while the rear springs are of the grasshopper type. A stand is fitted to the rear of the frame, and by simply removing the driving chains and undoing two tie rods the rear wheel can be removed for the purpose of repairing punctures, etc. Two large internal expanding brakes are fitted to the rear wheel.

Steering is effected through a 14in. wheel and a simple set of levers. Fixed Eisemann high-tension magneto and Amac carburetter are employed.

The machine, which was illustrated in these columns when it made its first appearance, and was originally known as the Titan Carrette (see page 700, July 6th, 1911), has a very pleasing appearance, and we are looking forward to a run which has been promised us at an early date.

Goodrich Tyres.

Goodrich tyres for next year will include a 650×65 mm. tyre for motor cycle use in addition to the usual $26 \times 2\frac{1}{2}$ in. pattern. These tyres are made both 28in. and $26 \times 2\frac{1}{2}$ in. and $2\frac{1}{2}$ in.

Fig. 3.—The gear removed from the hub shell showing clutch operating mechanism and drum for belt rim.

Fig. 4.—The two gear wheels and the transmission cranks H, also the low speed brake drum.

NEW DOUGLAS MODELS.

2½ h.p. Engine, Side-by-side m.o.i.v. standardised for 1912.

LAST week we examined the new model Douglas machines, which possess a number of novel features which should gain for these popular little mounts a still bigger vogue. Briefly the improvements consist of a gracefully dropped frame, enabling an exceedingly low saddle position, and an entirely new engine with side by side mechanically operated valves. Again, Messrs. Douglas Bros. have adopted the wise plan of specialising on one model engine, that is the 2½ h.p. horizontal twin-cylinder, which they have found to answer all requirements, for, in conjunction with the excellent two-speed gear, which long ago proved its worth, the 2½ h.p. stops at nothing, and it will be remembered repeated its consistent successes in, probably, the most severe trial on record, viz., the Yorkshire six days' trial.

We mentioned some weeks ago that Mr. W. W. Douglas had had a 5 h.p. twin built for his own use from one of the engine sets which are made specially for the Marconi Co., but, despite state-

The complete 1912 engine showing the timing gear mechanism.

an outstanding improvement, for by merely taking out five screws the cover plate may be removed, exposing all the parts ever likely to need adjustment. The valves themselves are larger in diameter and tapered at the most vital point under the head. The crankshaft is mounted in Hoffmann ball bearings.

A single silencer will be used in future, and its position, immediately under the crank case, exactly balances to the eye the position of the magneto on the top, giving the *tout ensemble* a most symmetrical appearance. The new method of fixing the induction pipe on the top of the cylinders and the inclined sparking plugs at the upper portion of the head, where they have been rendered more accessible, will be noted from our illustrations. The cylinders are now detachable without the necessity for dismantling the crank case from the frame.

Other 1912 Innovations.

There will be no direct drive Douglas in future. It has been found with the two-speed model that the large pulleys render belt adjustments so infrequent that the single-gear mount will have a chain reducing gear from engine-shaft to counter-shaft, to permit of a large diameter belt pulley. A notable departure in connection with the two-speed

mount is the provision of a kick starting apparatus. A rearward dig of a crank with a toothed quadrant meshing with a small pinion gives several revolutions of the engine which should be an ideal arrangement; ease of starting was always an attractive feature of the Douglas. The operation of the clutch is much more convenient on the two-speeder. Instead of a pedal in the region of the crank bracket a toe and heel pedal is mounted on the front footrests, or at the front footboards as the case may be, the foot brake having been transferred to the right hand side. To enable this method of operation, the leather to metal clutch has been redesigned and fitted on the right hand side of the machine, the final belt drive also being on that side.

Further modifications are an oil pump, the working of which may be seen at a glance, for after leaving the pump barrel the oil is delivered through a glass gauge mounted on the top of the tank. Further, it is not necessary to press the plunger

The gear and new kick-starting device on the Douglas machines.

The tank on the 1912 model Douglas motor cycles.

ments to the contrary, we have the assurance of the makers that it was never their intention to market this machine. Nor would such a policy be justified in view of the sustained and constantly increasing demand for the 2½ h.p. model.

Four different types in all will be listed, each with identically the same power unit. These are: 1, a single-speed mount; 2, two-speed; 3, two-speed and free engine; and 4, an open frame mount with two-speed gear.

The New Design Engine.

The engine has been redesigned throughout, but remains of the same capacity as heretofore, i.e., 60x60 mm. = 340 c.c. The advantages of mechanically operated inlet valves in the matter of slow running and reliability have not been lost sight of, and in the 1912 engine we have a clean design with a noticeable absence of push rods and bell cranks. Instead there is a central cover devoid of excrescences which encloses the valve gear, magneto transmission, and exhaust lifter mechanism, and emerging from each side of the casing are sloping tappets, adjustable by means of locknuts. The valves, as will be seen, are also inclined. In previous Douglas engines, the timing gear was carried inside the crank case, so that this exterior box may be regarded as

The 1912 model single-gear Douglas, showing new design dropped frame and redesigned m.o.i.v. engine.

CLUB NEWS.

Durham and District M.C.C.

The results of the novices' competition held on October 15th are: 1, J. H. Wood ($3\frac{1}{2}$ h.p. Dene-Precision); 2, H. Anderson ($3\frac{1}{2}$ h.p. Ariel). A smoking concert has been arranged for November 4th, to be held at headquarters (Neville's Cross Hotel) at 7 p.m.

Stockport and District M.C.C.

Results on formula of the hill-climb on October 15th have now been confirmed as follows:

Lightweight Class.—1, W. Heaton ($2\frac{1}{2}$ A.J.S.), 211.7.

Single Class.—1, H. J. Scale ($3\frac{1}{2}$ J.A.P.), 289.1.

Twin Class.—1, H. Marsden (5 Matchless), 318.6.

Sidecar Class.—1, J. Emerson (5 M.S.L.), 338.9.

In the single class H. J. Scale made fastest time, not J. Whyte as previously reported. The club annual dinner has been fixed for December 2nd.

Doncaster and District M.C.C.

Below are the results of the slow mile competition which was held on October 19th, the prize being a Rom combination cover presented by the makers:

Rider and machine.	Time.
1. T. H. Dunstan ($3\frac{1}{2}$ Rudge) ...	10m. 17s.
2. T. H. W. Dew ($3\frac{1}{2}$ Triumph) ...	9m. 28s.
3. H. Cundall ($3\frac{1}{2}$ Rex) ...	8m. 15 $\frac{1}{2}$ s.

Marlborough Athletic Club.

On October 15th the last reliability and speed-judging competition of the year was decided over a course from Kilburn to Bicester and back to Edgware, the distance being approximately 100 miles. An entry of fifteen was secured, and four prizes were presented by the club, whilst in addition Mr. A. P. Rey, of Hampstead, kindly presented a Hutchinson non-skid for the sidecar competitors. The successful competitors were: Messrs. F. J. Watson ($3\frac{1}{2}$ h.p. Bradbury), A. W. Hunt (5 h.p. Sarclea), J. C. Ball ($2\frac{3}{4}$ h.p. N.S.U.), and A. Rucker (7 h.p. Peugeot), losing 15, 30, 31, and 58 marks respectively.

Lancashire M.C.C.

A non-stop trial over a course of 170 miles from Preston to Kendal, Ambleside, Keswick, Shap Fell, and back was run off in splendid weather on the 15th inst. Competitors had to make a non-stop run to Dunmail Raise and then take the hill at not exceeding 15 m.p.h. From Keswick to Shap was also a non-stop run, and Shap Fell had to be climbed at over 25 m.p.h. Four riders made non-stops—Hugh Gibson and G. Wray on single-gear Bradburys, F. Sixsmith (Scott), and F. Jackson (B.S.A.). Owing to the failure of the stop-watches, there is some doubt about the timing up Dunmail Raise, and there is to be a committee meeting to decide upon the allotment of the prizes, the first being a Kempshall tyre.

Newcastle and District M.C.

The winter session was inaugurated on Thursday, the 19th inst., when a largely attended supper and smoking concert took place in the club house, 3, Saville Place, Newcastle-on-Tyne, about eighty members being present, with Mr. Robson Crosier in the chair. A most interesting musical programme had been arranged.

Mersey M.C.

A reliability trial from Liverpool to Kendal and back was held on October 15th, the prizes being awarded to the riders adhering nearest to a set speed of twenty miles per hour, the checks being all secret. The winners were: 1, S. W. Philippott (Humber); 2, J. Bethel (Douglas); 3, F. C. Jones (Bradbury).

On October 29th will be held the last competition of a very successful and strenuous session in the form of a flexibility hill-climb on a well-known acclivity in North Wales. Prizes (value £2 and 10s. 6d.) are presented by two clubmen.

One of the most enjoyable contests organised by this club was the week-end speed-judging expedition to Kendal and back (137 $\frac{1}{2}$ miles), the speed set being twenty miles an hour. The judge's awards were: 1, W. S. Philippott (2 h.p. Humber), 6m. 52s. error; 2, J. Bethel (Douglas), 7m. 36s.; 3, F. Jones ($3\frac{1}{2}$ h.p. Bradbury and sc.), 8m. 24s.

Harrogate and District M.C.C.

An extra competition was held on the 15th inst., when the whole of the arrangements were entrusted to the secretary, and none of the entrants were aware of his plans. At the outset the competitors were informed that they must run on the same gear during the afternoon under penalty of disqualification, while the penalty for riding in front of the secretary, or for any stop was a loss of five marks.

The afternoon included many diverting forms of control, riding round a blind corner and coming to a dead stop to avoid over-riding the inexorable secretary, a speed trial decided on formula, also a hill-climb, and a slow down hill run, then licences had to be produced under penalty for default. The highest number of marks obtainable was 110.

CLASS I.—For ordinary fixed gear models.

Rider and machine.	Points.
J. E. Brooke ($3\frac{1}{2}$ h.p. T.R. Triumph) ...	109
W. E. Grange ($3\frac{1}{2}$ h.p. Bradbury) ...	93
T. Maynard ($3\frac{1}{2}$ h.p. Triumph) ...	84
H. Ballance ($3\frac{1}{2}$ h.p. Triumph) ...	63
F. Stafford ($3\frac{1}{2}$ h.p. Triumph) ...	50
W. Atkinson ($3\frac{1}{2}$ h.p. Calthorpe) ...	37
G. Sayner ($3\frac{1}{2}$ h.p. T.T. Triumph) ...	32

CLASS II.—For variably geared models.

	Top gear.
1. T. C. Atkinson ($2\frac{3}{4}$ h.p. New Hudson) ...	4 to 1
2. W. Aldon ($3\frac{1}{2}$ h.p. Premier), three speeds ...	4 to 1
3. C. Nettleton ($2\frac{3}{4}$ h.p. Hudson) ...	5 $\frac{1}{2}$ to 1

The Herts County A.C. Speed Trials at Luton - Hoo. A general view of the course. The surface was in excellent condition at the start, but owing to the rain which fell heavily during Classes V. and VI. in Division A, the surface became rather wet.

Club News.—

Edinburgh and District M.C.

It is hoped that the entry for the concluding hill-climb of the year, which is fixed for October 28th, will be a good one. Competitor will assemble at Whitebault's Farm Hill, near Linlithgow, and will be divided into six classes. Entries, except at double fees, close to-day (Thursday). Hon. secretary, T. E. B. Chalmers, 6, Summerside Street, Leith, N.B.

North Middlesex M.C.C.

On Saturday, October 28th, the meet will be at the Gatehouse, Highgate, at 3.30 p.m., for a run to the Red Lion, Hatfield. In the evening a smoker will be held at the Gatehouse, for which a strong musical programme has been arranged.

Western District M.C.

At the recent committee meeting it was again decided to hold the annual club supper. Full particulars will be issued later. The hon. secretary, Mr. V. Armstrong, Eden Hall, Montpelier Road, Ealing, W., will be pleased to hear from any member who is able to assist in the organisation of the musical programme. Further donations to the club prize fund have been received from Messrs. N. Hall and T. Babbage.

Sutton Coldfield A.C.

The above club is holding a reliability trial in conjunction with the Birmingham M.C.C. on Saturday next, the 28th inst. The first prize is the P. J. Evans Trophy kindly presented by the winner of the Junior T.T. Race, whilst other valuable prizes will be given by Messrs. Humber, Ltd., Triumph Cycle Co., Ltd., Joseph Lucas, Ltd., Powell and Haumer, Cox and Phillips, and the Lycett Belt Co. Endeavours have been made to ensure the competition being of an enjoyable character throughout. Full particulars may be obtained from the hon. secretary Birmingham M.C.C., Oakdene, Cambridge Road, King's Heath, or the trials hon. secretary, Sutton Coldfield A.C., 33, Fountain Road, Edgbaston.

Newcastle and District M.C.

With the view of filling up the long winter evenings, this club has decided on the following fixtures:

November 9th.—Motor cycle fault competition, light supper and impromptu smoking concert.

November 30th.—Whist drive.

December 21st.—Supper, to be followed by a paper on "The Show," by the Chairman.

January 11th.—Supper and smoking concert.

January 20th.—Semi-final and final of the Billiard Handicap.

February 1st.—Whist drive and dance.

February 22nd.—Motor cycle fault competition, light supper and impromptu smoking concert.

March 14th.—Supper and smoking concert.

Doncaster and District M.C.C.

The following are the results of the hill-climb held at Stainborough Lowe on the 12th inst.:

	Position on time.	Position on formula.
F. H. Dunstan (3½ Rudge) ...	X	.736
E. Gault (3½ Triumph) ...	N4½s.	.875
J. Gill (3½ Calthorpe) did not finish.		

Results of the flexibility hill-climb: 1 (the club's gold medal), J. Haslam (6 h.p. Zenith-Gradua); b (gold medal for the fastest time of the day), T. Dunk (3½ h.p. T.T. Bradbury); c (medal for the fastest single-cylinder), T. Dunk (3½ h.p. Bradbury); d (silver medal for the slowest time of the day), J. Haslam (6 h.p. Zenith).

Tie in Class II. (Touring Singles), on the 28th ult.

Stockport and District M.C.C.

The last hill-climb of the year was held at Woodhead on the 15th inst. The course was 1½ miles with a rise of 900 feet. In spite of a small entry some very fine riding was witnessed. W. Heaton (2½ h.p. A.J.S.), winner of the Liverpool A.C. trial last week-end, made a very fine ascent for a small engine, and stands well for first prize on formula. H. Marsden (5 h.p. Matchless) did fastest time of the day. 2m. 40s., and J. White's Triumph was the fastest single. J. Emmerson (5 h.p. N.S.L. and sidecar) won the sidecar class. The final results on formula will be published later.

Tunbridge Wells and District M.C.C.

The final run of the season was to Cranbrook. This club has now a membership of over sixty, which, as the club was only started four months ago, is highly satisfactory. This is largely due to the energy of the hon. sec., Mr. A. R. Courtenay.

Brookdale Cycling and Social Club (Motor Cycle Section).

The club's first hill-climb was held on Westerham on the 14th inst., J. Hault (3½ h.p. Bradbury) making fastest time in 1m. 24½s. He also secured third position on formula. R. Croucher, on a 3½ h.p. Kerry-Abingdon, was placed first on formula, besides winning the flexibility trial. A. J. Ball, on his 3½ h.p. twin J.A.P., was the second rider on formula.

**MORE MARRIED COUPLES WHO
MOTOR CYCLE.**

Frau Rossner, who is said to be
the only lady motor cyclist in
Germany.

Herr and Frau C. N. Rossner of Berlin, subscribers to this journal, who were moved to send the above photograph on seeing our series of married couples who motor cycle. The machines are the Austrian Puch, which have been ridden 3,000 miles this year.

THE TRADE AND THE T.T.

THE leaderette we published last week stated that a large percentage of the members of the Manufacturers' Union had agreed to abstain from the Tourist Trophy Race if the A.C.U. decide to hold it in the Isle of Man next year, but we did not explain the manufacturers' reasons for withholding their support of further T.T. road races held under conditions similar to those which have prevailed up to now. Motor cyclists might reasonably argue from the decision of the makers that the industry is averse to all kinds of racing, but this is not the case, and as riders who are not acquainted with the inner workings may regard the makers' attitude as somewhat arrogant we have penned this short article, not in defence of the manufacturers, but to explain to our readers some of the reasons underlying the unfavourable disposition of the bulk of the industry towards road races in the Isle of Man.

Reasons for Abstention.

First. The makers are of the opinion that the T.T. races are not held under tourist conditions, that the machines employed do not foster the improvement of the ordinary touring motor cycle, and that the title of the races is a farcial misnomer.

Second. Twin-cylinder and single-cylinder engines have to compete against one another, the former being allowed an increased cubical capacity which, although theoretically correct, is, the makers claim, unfair to the single-cylinder machines. The fact that both last year's races were won by riders on twin-cylinder mounts is sufficient proof that, other things being equal, the single-cylinder engine of a less cubical capacity has no chance.

Third. The expense of competing such a long distance from home as the Isle of Man is considerable in comparison with a similar contest held, say, at Brooklands. Most of the important firms in the trade have London agencies or depots, and the convenient accessibility to Brooklands for their managers and racing staff makes practice and tuning-up a very simple matter compared with the despatch of a staff of riders and someone to look after them to the Isle of Man, and their temporary residence there for a week or a fortnight previous to the contest. Spare parts, tools, and other impedimenta have also to be sent over the water, whereas if the race were held at Brooklands the assistance of London workshops is immediately available, and even if these had to be transported temporarily to Brooklands for a week, the expense would be trivial in comparison with sending to the Isle of Man.

Fourth. It is annoying to manufacturers of motor cycles, when they have decided upon the equipment of their machines which are to run in the Tourist Trophy Race, to find on arrival in the Isle of Man that there are representatives of various firms strongly

in evidence who leave no stone unturned to induce the riders, and the representatives of the firms whose machines they ride, to change various fittings and accessories with the bribe that if victory in the races should accompany the use of their particular brand of tyres or accessories, a money prize will be offered in addition to the prizes awarded by the promoters of the contest. Whatever advantages this system may offer to some riders and manufacturers, it is a bad one and often abused. The more important and better class of manufacturers are very much opposed to this touting practice, and although they are not antagonistic towards a proper business arrangement with regard to the accessories which are fitted for a race, they do not approve of their riders being more or less tampered with when they are out of their control.

Training and Self-restraint.

Fifth. The general holiday surroundings at a seaside resort like Douglas are not conducive to that thorough training and self-restraint which a severe contest like the T.T. Race imposes on those who take part in it. No one objects to a little harmless amusement at times like the Tourist Trophy week, but the unfortunate variety of taste shown in the forms of that amusement does not by any means promote the health or sobriety of some of the competitors, with the result that a few—fortunately they are very much in the minority—who are not sufficiently strong-minded to resist temptation, instead of coming to the post with clear heads and strong nerves, are physically unfit to take part in any strenuous form of competition. Doubtless the same kind of thing exists in almost every form of sport, and is not confined to motor cycle racing, but the manufacturers think, and we agree with them, that as it is a very difficult thing indeed to control such vagaries of conduct, the only other course to pursue is to endeavour to alter the venue of the contest and hold the race where many, if not all, of the undesirable conditions to which we have alluded would be at least improbable.

Will there be T.T. Races in 1912?

Doubtless the meetings which will take place between, now and next year between the committees of the A.C.U. and the Manufacturers' Union will enable matters to be arranged so that the above conditions do not interfere with a sporting competition, and although we should not like our remarks to be read as a sermon, we know that we are voicing the opinions of some of the most prominent men in the industry who are the backbone of the Manufacturers' Union.

It is possible that the Auto Cycle Union will hold the race in the Isle of Man despite the decision of many of the makers, and if it does, we hope that the rules will be so formulated that the vexatious methods under review will be entirely eliminated.

The Binks Carburetters.

Two new carburetters have been sent to us by Messrs. C. Binks, Ltd., Eccles, Manchester, which embody principles not usually found in such instruments. It has been found that if a body is passing

choke tube gradually expands beyond the jet at the proper angle, the gas will pass through with less resistance than if there are corners, etc., which set up eddies. It will be noted that these carburetters fulfil this condition when working at full throttle. The second point is the fitting

In the racing pattern the jet is situated a long way in rear of the float chamber; this has the effect of raising the petrol level in the jet when going up hill. The jets, six of which are supplied with each carburetter, can be changed without dis-

The complete Binks carburetter.

Section of the standard two-jet Binks carburetter.

The new Binks racing carburetter designed to give a stream-line effect.

swiftly through the air the shape of the back part has a greater effect on its progress than the shape of the front, and the same naturally applies to the case of air or gas passing through apertures, and if a carburetter can be designed in which the

of a pilot jet for slow strong pulling and starting purposes. A slight movement of the lever opens the pilot jet, and a larger opening brings the main jet into play. The choke tube in the roadster pattern can be slightly turned round to cut off part of the air supply, but except for this the carburetter is automatic, there being no separate air control.

mantling the parts. The accessibility of the parts is a big point in favour of the Binks; for instance, the top of the float chamber is held in place by a spring clip, and is therefore very quickly and easily detached.

THE NEW AUTOCLIPSE LAMP.

We illustrate below the new Autoclipse motor cycle lamp, with fork bracket, which will be shown for the first time at the Show next month. This lamp is supplied with a rolled gold reflector, which is quite untarnishable and has been found to give very good results, especially

Next year's 2 1/2 h.p. Motosacoche, a description of a run on which appears on another page.

in foggy weather. A yellow light has been found to penetrate fog better than the usual white light. The lamp can be had either with or without the anti-dazzling mechanism from Brown Bros., Ltd., 15, Newman Street, W.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Weymouth to Kidderminster.

? What is the best way to get from Weymouth (Dorset) to Kidderminster (Worcestershire) by motor cycle?—H.B.M.

Your best route would be: Weymouth, Yeovil, Bruton, Frome, Beckington, Bath, Stroud, Gloucester, Tewkesbury, Worcester, and Kidderminster.

Southwold to Liverpool.

? I shall be pleased if you will tell me the best route from Southwold to Liverpool on an 8 h.p. Minerva cycle.—R.H.M.

Your best route would be as follows: Southwold, Halesworth, Bungay, Norwich, Dereham, Swaffham, Lynn, Long Sutton, Swineshead, Sleaford, Newark, Mansfield, Alfreton, Wirksworth, Ashbourne, Leek, Congleton, Northwich, Chester, Birkenhead, and Liverpool.

A Driving Licence Query.

? I have a 5s. driving licence, which I obtained by application to Stafford. When I received same I found it was made out for a car only, while I expressly asked for a cycle licence. The fee is, I believe, the same in both cases. Can you please tell me whether I should do right in driving a cycle with it, and whether a car licence is applicable to a cycle as well, and *vice versa*? If not, shall I send it back and ask for it to be altered?—A. P. BOWER.

Your licence is quite in order, as it enables you to drive a motor cycle. A cycle licence, however, does not allow you to drive a car. In applying for the licence one should state that both types are to be driven.

Care of Magneto.

? I have recently purchased an A.J.S. motor bicycle. The magneto with which it is fitted is, I believe, a U.H. I cannot discover how to lubricate this, as there seems to be no oil holes. I presume it requires lubricating. Can you please advise me how to do this, how much oil to give it, and how often? Being a novice I do not care to tamper with the magneto.—A.L.

We have been in communication with the agents for the U.H. magneto, and they inform us that there is no need to lubricate this magneto. The bearings are packed in vaseline, and this lasts practically indefinitely. If the magneto is taken down to be overhauled the bearings should be washed out with paraffin and the vaseline replaced.

Free Engine on a Lightweight.

? (1.) Will you please give your opinion of the Royal Enfield free engine model twin? Do you recommend it as a thoroughly satisfactory machine for hard wear and no worry? (2.) Is the free engine an advantage in any way for a machine so light that it can be started by pedals? (3.) Is the engine more difficult to handle than, say, a Triumph $3\frac{1}{2}$ h.p.? Does it need more attention, and lastly what about the chain drive? (4.) Do you recommend it in preference to a belt, as I am a bit suspicious of the chain drive? (5.) How can pedal chain be adjusted?—T.W.T.

(1.) We have a high opinion of the machine mentioned in your letter. (2.) A free engine is distinctly an advantage, either with a light or heavy machine. (3.) It is not more difficult to handle than the $3\frac{1}{2}$ h.p. single-cylinder referred to. (4.) You need not worry about the chain drive. (5.) There is no pedal chain on the free engine model. It has a two-speed gear, and pedals are not required.

A Motor Cycle for Sidecar Work.

? Can you give me information as to the T.A.C. machine for general and sidecar work? Is it reliable, comfortable, and easily driven, and are the makers easy to deal with when repairs, spares, etc., are required? What is about its average mileage per gallon of petrol when driven by a driver of average ability? Also can you advise me as to the suitability of the single-cylinder Zenith-Gradua for sidecar use? I mention the single-cylinder because I shall require it for solo work as well.—N.F.

We regret we cannot give you definite information about the machine in question, as not enough has been seen of it on the road this season. We refer you to a description of a trial run in our issue of February last. The petrol consumption would be 60 to 70 m.p.g. Yes, the machine in question is good for sidecar work, but a single-cylinder, of course, has not very much reserve of power. We recommend a 5 to 6 h.p. twin and variable gear.

Start of the Lancashire M.C.C. 180 miles non-stop reliability trial last week. The course was to the Lake District.

What Size Jet?

? What is the best size jet (B. and B.) for my 3 h.p. (75 x 90) Zedel engine? I want to try about five jets to see with which I get the best results. I have now got in a No. 32 jet, but think it is far too large, as the engine overheats very quickly, and the exhaust valve wants grinding about every 200 miles.—O.C.

No. 32 is certainly too large. Try a No. 28 or No. 27, but the correct size jet can only be found out by experiment. Before commencing your experiments, test the petrol level. A set of four jets in a case may be bought from Messrs. Brown and Barlow, Witton, Birmingham.

Knocked Down by a Cart.

? I was proceeding up Kentish Town Road, N.W., about one yard from the kerb on my proper side at about 8 m.p.h. when I noticed a cart come sharply across from the opposite side and in the opposite direction. The traffic being very thick I did not notice this until it had got almost on to my side (the driver was taking a narrow turning on my near side), not giving me any chance to pull up in time, as it was within three or four yards of me. I put on my brakes, which reduced my speed to 3 or 4 m.p.h., when the shaft of the cart caught me in the face, knocked the machine on to its near side, doing considerable damage, as the horse went right over it, with my machine acting as a brake under the wheels of the cart. I had all but got by the turning, my machine lying right on the corner. I have since had notice that I am to be responsible for a broken cart shaft and injured horse's fore legs. You will notice that had the driver pulled the horse's head round square with my road, or even slightly so, I could have got through. I shall be very glad of your advice in this matter, as I am thinking of suing the man for my damages; it, therefore, amounts to a crossed case.—PERPLEXED.

Our legal correspondent writes: "With regard to the query of 'Perplexed,' if he can prove the statements made in his letter

he should be able successfully to withstand any action which may be brought by the driver of the cart. I think your correspondent would be well advised to claim damages for the injuries sustained by him, but before commencing proceedings he should see a solicitor, who would advise him as to the sufficiency of the evidence. He does not mention in his letter whether he knows of anyone who saw the accident. It would be absolutely useless for him to start an action unless he has good witnesses to support him. He must also be prepared to satisfy the court that there was no carelessness on his part in not noticing earlier the direction the horse and cart were taking. Your correspondent does not say whether the owner of the cart was driving at the time. If someone else was driving, the owner is not responsible, unless the driver was his servant and was so driving in the ordinary course of his employment."

Nottingham to Lancashire.

? Which is the best route from Nottingham to Burnley, Burnley to Wigan, Wigan to Bolton, and Bolton back again to Nottingham?—F.J.F.

There is no good route from Nottingham to Burnley except the following, which necessitates a fairly big detour: Nottingham, Mansfield, Doncaster, Ferrybridge, Aberford, Bramham, Harewood, Otley, Ilkley, Skipton, Colne, and Burn-

ley. Burnley to Wigan: Burnley, Accrington, Blackburn, Chorley, and Wigan. Wigan to Bolton: Direct road. Return to Nottingham. It would be best to go through Atherton and Warrington, and then via Knutsford, Macclesfield, Buxton, Bakewell, Chesterfield, and Mansfield to Nottingham.

Long Exhaust Pipe.

? I have a 1908 2½ h.p. Ariel (magneto) and wish to make it more silent. (1.) Would it run more quietly if I fitted an exhaust pipe running to the back hub without a silencer in connection? I might add that the exhaust valve is on the near side of the engine with overhead mechanical inlet. (2.) If above would not do, could you tell me a better method without losing more power than necessary?—S.H.C.

The long pipe is quite a good idea, but you ought to have an expansion chamber fitted into it midway between its extremity and the exhaust port. It might be necessary to fit one or two baffle plates in the expansion chamber.

EXPERIENCES WANTED.

"Capt. J.A.B." (Preston). N.S.U. gear on a Triumph.

"C.J. 523" (Hereford). Morgan runabout; also 2½ h.p. two-speed A.J.S.

"A.E." (Godalming). (1.) 3½ h.p. P. and M. and sidecar. (2.) 5-6 h.p. four-cylinder F.N. and sidecar.

"H.A.H.T." (Stroud Green). 3½ l.p. Humber, two speeds and sidecar.

"W.S." (Brixton Hill). 3½ h.p. Calthorpe, also 3½ h.p. Ivy-Precision.

"R.S.C." (Huddersfield). Carburettors suitable for use on the A.C.

"C.J." (Barnet). 8 h.p. Matchless-Jap and sidecar, with V.S. two-speed and twin belt.

"A.H." (London). 3½ h.p. two-speed 1911 Humber and sidecar, especially with regard to engine reliability and running costs.

"B.R." (Lincoln). 5½ h.p. and 5 h.p. two-stroke Scott, also C.A.P. carburetter.

"W. 1590" (Bucks). Bedelia Runabout, particularly as regards reliability and cost of upkeep.

If "R.N., H.M.S. Blenheim," will forward a stamped and addressed envelope, his letter of the 16th inst. will have attention.

LADIES AND THE MOTOR CYCLE.

(1) Miss Maud Rowland, of Bangor, and her 2 h.p. M.R., which she has ridden 2,000 miles since last May.

(2) A Worcestershire rider of a new model open frame Enfield.

(3) Mrs. A. B. Wade (3½ h.p. Scott) competing in the South Wales A.C. hill-climb. She covered the course of 1,196 yards in 1 min. 44 secs.

B.M.C.R.C. Secretary's New Post.

Mr. T. W. Loughborough, the able hon. secretary of the B.M.C.R.C., has recently taken up an important position with the London General Omnibus Co.

Changes of Address.

The Express Rubber Co., Ltd., have removed to more commodious premises at Nobility House, 1-3, Worship Street, E.C. Samuel Hall and Sons, Ltd., are moving from Edinburgh to a new factory in Wrotesley Street, Birmingham.

Catalogues Received.

The first 1912 catalogue of motor cycles which we have received for review comes from Humber, Ltd., Coventry, and contains specifications of all their new models. Illustrations are in course of preparation, some of them having already appeared in recent numbers of *The Motor Cycle*.

Sparking Plugs.

Messrs. Leo Ripault and Co., Poland Street, Regent Street, W., of whom we made mention a few weeks ago, are the selling agents of the "Oleo" sparking plug. In the manufacture of these plugs the insulator is pressed into the plug hydraulically so as to render it absolutely compression tight. The best French porcelain is used in its manufacture, and the plug is made in four different qualities, which therefore enables it to suit all pockets.

The above plugs were tested by a member of our staff and found to be quite satisfactory.

A Counter-shaft Two-speed Gear.

Upon the counter-shaft A is keyed the belt pulley B, and, mounted loosely, the chain sprocket C, which is driven from the engine. Between the pulley B and sprocket C is a carrier D, carrying compound pinions E, which gear with pinions F and G, of which F is fixed to the sprocket C and G secured to the shaft A. The carrier C is provided with a brake band H. On the opposite side of

the sprocket C is a plate clutch J provided with actuating mechanism K. In operation, when the band H is released and the plate clutch J inoperative, a "free-engine" is obtained, the effect of the rotation of the sprocket C being merely to rotate the carrier D backwards. Tightening the brake band H holds the carrier D stationary, and a reduced drive takes place *via* the sprocket C, pinion F,

**Auction Sale.**

Nye and Co. are holding an auction sale at their city premises, 59, Leather Lane; E.C., commencing Thursday, November 2nd. Second-hand machines of several well-known makes will be offered at low reserve prices.

Self-sealers' Annual Report.

The Self-sealing Rubber Co.'s sixteenth annual report and statement of accounts, which was presented at the ordinary shareholders' meeting in Birmingham, shows a total credit on the profit and loss account of £4,736 15s. 1d.

Dry Battery Ignition.

We are in receipt of the latest catalogue, No. 527, of dry cells and batteries from Messrs. Siemens Brothers and Co., Ltd., York Street, Westminster. This is a useful publication, as it gives not only prices and particulars of the cells, but also instructions as to how to use and wire them. It is interesting to note that Harry Martin and F. Chase used No. 387 Siemens-Obach dry batteries in the motor cycle race at the Crystal Palace held by the Marlborough Athletic Club last month.

compound pinions E, to the pinion G, and thus to the belt pulley B. By releasing the band H and engaging the clutch J, a direct drive is provided, the whole mechanism rotating solid.—T. S. Grieve and A. V. Clarke, No. 27,213, 1910.

An Ingenious Scavenging System.

By this invention the strokes of a four-cycle engine are made variable in length, the object being to provide efficient scavenging. The diagrammatic figures 1, 2, 3, and 4 respectively illustrate the engine in the following positions: Commencement of induction stroke, end of induction stroke, end of compression

Fig.1

Fig.2

Fig.3

Fig.4

Fig.5

stroke, end of explosion stroke. Transfer passages are provided between the crank case and the combustion chamber, and, as shown in fig. 2, these passages are not opened by the piston at the end of the induction stroke, but at the end of the firing stroke the piston descends far enough to open these passages, as shown in fig. 4, allowing a scavenging charge of air to pass into the cylinder. This operation is effected by mounting the connecting rod A (fig. 5) upon the crank pin B through the intermediary of an eccentric C. Upon the eccentric is a pinion D passing through an aperture in the flywheel and engaging a pinion E fixed on the interior of the crank chamber. By this means the eccentric is operated in such a manner as to provide the variable strokes required. Further, by an adjustment of the position of the eccentric the upper limit of movement of the piston may be variable, being caused to ascend nearly to the top of the cylinder on the exhaust stroke, still further ensuring complete scavenging.—S. J. H. Wilkes and F. E. Baker, Ltd., No. 4,482, 1911.

Tyre Successes.

At the recently held Herts County A.C. meeting, Mr. J. T. Bashall made the fastest time of the day on Rom tyres, which we are told had already done 1,000 miles on a sidecar machine.

A New Tyre Depot.

The Lomax Tyre Co., William Street, Birmingham, have taken premises at 244, High Holborn, W.C., where they will hold a stock of all sizes of Lomax tyres.

Stanhope Spencer's Record List.

In addition to the five world's records already announced, there are four other records standing to the credit of W. Stanhope Spencer and his 3½ h.p. Rudge. They are the fifty miles, one hundred miles, and one hour previously made on machines of two-cylinder and 750 c.c. capacity; also the one hundred miles record made on a twin-cylinder of 1,000 c.c. capacity.

Valve Cotter Extractors.

The Relyabull valve cotter extractor sold by the Nottingham Factoring Co. is a useful tool. We have one in use and have found it remarkably easy to detach the exhaust valve with its aid. This particularly applies to an extraction when the engine is hot, as it is possible to fit the Relyabull on the valve, lift the spring, withdraw the cotter, and file the burr off the edges of the slot while the engine is cooling down. No part of the valve need be touched with the fingers during the operation.

OFFERS WANTED.

CORONET SIDE CARS

ONE MINUTE REQUIRED.

CORONET Sidecars are all fitted with our improved QUICK DETACHABLE JOINTS, and can be detached in one minute.

LESS POWER REQUIRED.

In consequence of the unique design of frame in the "CORONET," less power is required to drive, compared with other sidecars.

MODEL C.—£7 2s. 6d.

MODEL A.—£5 5s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Excellent upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing lopsided about this attachment.

Delivery from stock to suit TRIUMPHS, N.S.U.'s, REXES, P. & M.'s, BRADBURY'S, etc. Discounts to Agents.

1911 Premier, free engine, run under 300 miles, good reasons for selling, accessories; £50.—Ruckman, Matlock.

REMEMBER

The value of your present machine is depreciating week by week.

Why not exchange now or at the end of the season for a 1912 model?

We can allow far better prices than those which rule in April, and, if you wish, advance you a big part of the allowance in cash.

Why not write, or, better, call and discuss with us.

DO IT NOW!

This is the principle of success in business. The man who leaves things until to-morrow never does them at all. Months ago we decided that it was THE RIGHT TIME to buy Motor Cycles for next year's delivery, and WE BOUGHT THEM. The same thing applies to Tubes, and Tyres, and Accessories, and it is only by this means that we can give to our customers the extensive variety at such low prices and such quality.

It is no use approaching the makers of high-class machines at this time of the year, as they are long since booked up for 1912. The machines that can be bought now are not much class, and you don't want them.

You will have noticed that we have been telling the tale about going to Lancaster for some weeks now. However, upon taking a survey of Lancaster and district, we could not find anything in the way of a Garage half so big as ours. We could not find a place as GOOD AS OURS WILL BE when the extensive alterations which the landlord finally decided to do are finished. We shall very shortly have a NEW ROOF ON, and have the option of a piece of ground on which TO BUILD AN EXTENSION. Having these favours offered us, we remembered the maxim above, and DID IT. We are now fixed up for a lengthy period in Morecambe, and anticipate your kind favours and CONTINUED PATRONAGE in the FUTURE, as in the PAST. What we ask of you is TO DO IT NOW—that is, place your order with us for that 1912 model, whether for Cash, Deferred, or Exchange terms; they are all alike to us. We have now made Special Capital arrangements, whereby we shall be enabled to extend our operations in the field of supplying NEW MACHINES on the DEFERRED. Our terms will be THE BEST ON THE MARKET. Our CHOICE of machines IS ALREADY the best on the market, and the ONLY THING that we are wanting is to get the LARGEST TRADE of any firm on the market. We think we are not far from that now. However, patience will do it.

We have had a wonderfully successful year, and want it to be the FORERUNNER of many others. We have GROWN LIKE A MUSHROOM, but NOT on mushroom foundations. The foundation IS GOOD, and therefore the structure will stand.

Once more, we offer to any man who is dissatisfied with our deals SATISFACTION. We don't succeed in pleasing everybody—no one can—but, we want to please YOU. It is impossible to go wrong with us. As stated week after week, if the goods are not satisfactory, return them at once, and have your money back in full. These words have been used hundreds of times in "The Motor Cycle," and yet we find it necessary to repeat them week after week. People seem to be so sceptical that they cannot imagine them to be correct, as there comes a hundred letters per week enquiring as to the correctness of same. YES, WE DO THIS WITH PLEASURE.

By-bye, B'hoys. From one of the Nuts.

ADDRESS: 20, TUDOR STREET, LONDON, E.C.

The A.C.U. and Provincial Clubs.

THE old bone of contention between the Auto Cycle Union and provincial clubs with regard to the control of the pastime is being wrangled over once more. Some few years ago the Union—then the A.C.C.—was subjected to the same trials and tribulations as it will apparently have to face again in the immediate future, with what result time alone will show. The result of the last uprising on the part of local organisations resulted in certain alterations in the rules and regulations, principal among which were the perambulating council meetings, formation of provincial centres, and the alteration of the title of the Auto Cycle Club to that of the Auto Cycle Union. In response to the requests of local centres, the quarterly trials courses were altered to enable local riders who resided many miles from the London area to participate in these events without being compelled to ride long distances to and from the venue. Despite such concessions and ameliorations, the local support of the trials has been somewhat meagre and disappointing, and without the trade entrants, who do not apparently mind, within limits, where the trials take place, the contests would have been somewhat of a failure. This points to the fact that, despite the alterations which have been made, those who were keenest in advocating the changes have not shown the same strong desire to take part in events specially arranged to suit their convenience. There are exceptions, but the general support which was promised if the venues were changed has been poor on the whole.

The chief causes of the present trouble are refusal by the A.C.U. to grant permits to provincial organisations to hold open trials on the lines of those already

promoted by the governing body; the suspension by the A.C.U. of riders who compete in open events, such as hill-climbs, without a licence, and for which no permit has been obtained; the alleged trade influence on the executive of the A.C.U. being detrimental to the pastime; and the allegation that a goodly proportion of the acting executive are not habitual users of a motor cycle.

Open revolution has not been established, but threats have been made that provincial bodies are determined to form another organisation and to ignore the A.C.U. unless their present demands are met. Now, we hold no brief for either party. We exist for the purpose of improving the motor cyclist's lot in every possible manner that lies in our power and in a legitimate way. Therefore we recommend arbitration as opposed to open warfare. Let those who have grievances meet the A.C.U. executive and discuss their differences in an amicable spirit. Nothing will be gained by the formation of opposing organisations, because the time-worn phrase, "Union is strength," will yet be found the best policy. Those who are so anxious to form an opposing body or bodies will find if they ever get into swing that running big open events and the general conduct of trials cannot be successfully undertaken without funds. A very large proportion—we might say nearly all—of the A.C.U. executive work is done gratuitously. Will a new body be able to secure more honorary labour than the present one? We doubt it. Mistakes have been made, and further errors will occur, but are those who are desirous of throwing off the yoke certain that they can do better? A multiplicity of organisations would prove as dangerous as it has already proved a menace in other directions.

A RECORD HILL-CLIMBING EXPEDITION.

UP PORLOCK;
LYNTON, COUNTISBURY,
CHEDDAR GORGE, BIRDLIP
& FARLOW BANK
ON A
SIDE CAR.

In Cheddar Gorge.

R. Jones

At the top of Countisbury.
Observe the narrow road.

IT was during the Six Days' Trials in Yorkshire that Frank Smith unfolded an ambitious scheme he had in mind of climbing all the Devonshire hills of repute, and thus be the first to make a clean ascent of Porlock, Lynton, and Barbrook on a motor cycle and sidecar. Would I accompany him on his Clyno sidecar, observe and duly chronicle the performances? The opportunity of a trip in Devonshire does not come my way very often, so my answer was short and wholehearted. It so happened that we could not fit in a week-end, owing to previous engagements, until October, and at each delay I pointed out the improbability of success should the roads be covered with winter mud. Of course, Frank Smith should have been in the better position to know, as his stoppage on Porlock in the M.C.C. Trial last August was due to the driving wheel spinning round on the wet roads with the sidecar at a standstill.

It was raining, literally pouring, as I trained for Wolverhampton, on Friday, October 20th, where we had arranged to meet. Here I also found Roy Walker, to whom I had tentatively suggested only the day before that he might accompany us on one of the new model $3\frac{1}{2}$ h.p. three-speed New Hudsons. Surely never was a tour commenced under such dismal conditions. We headed for the nearest point on the Quarterly Trials course, our intention being to include Farlow Bank on the first day's run to Bristol. A few miles out of Wolverhampton we were obliged to stop and don oilskins, and how I inwardly blessed the thoughtful individual who put a storm apron on the sidecar for me. The country side was wrapped in mist and fog, but the machines ploughed through the seas of water. I was undoubtedly the most comfortable of the trio, ensconced in the luxuriously upholstered coachbuilt sidecar, which is suspended at the front on a laminated spring placed transversely, and at

A Record Hill-climbing Expedition.—

the rear on cee springs. Soon the weather conditions improved, the sun peeped from behind the clouds, and we noticed, as Walker sped past us on a hill, that he smiled for the first time that day.

Farlow Bank was in a very different state from what it was on the day of the Quarterly Trials. The soft black soil had apparently been washed away, and the surface was now strewn with small loose granite. We had arranged to take Farlow Bank on the run with hot engines, and I fancied it was going to be a tough test, but writing this subsequent to our further truly exciting adventures in Devonshire, one cannot go into raptures with any exhibition on Farlow, as the Bank cannot be compared with Porlock, for instance. The corner is bad enough, though much easier for a sidecar than a solo motor bicycle, but Frank Smith's four-speed Clyno simply toyed with the gradient on its low gears of $8\frac{1}{2}$ and $14\frac{1}{2}$ to 1. Dropping down the hill again to the corner, we turned the sidecar round and restarted from a standstill, gathering speed practically all the way. Roy Walker had never seen Farlow, and as I glanced from the sidecar I saw him and his machine at a standstill twenty yards above the bend. After a little practice on the corner he made several sure climbs on the lowest ratio of his Armstrong gear. We found a nail and a thorn in the sidecar tyre, and after repairs we continued over the Cleve Hills, making good progress to Worcester and Tewkesbury. The ride was becoming most enjoyable; we passed through richly-wooded avenues, the rain-soaked leaves of a wonderful variety of tints looked most beautiful in the sunlight. A mile out of Tewkesbury our party was reduced, for we came upon Walker looking very disconsolate as he held out his hand "good-bye." He was the victim of a most unusual accident. A spare belt on the luggage carrier had by some means shaken loose, and one end of it had dangled into the rear wheel and ripped every spoke out of one side of the wheel in addition to shearing off the rear hub flange. This experience should act as a warning to other motor cyclists to fasten belts, or any other spare for that matter, securely to the carrier.

Darkness and Rain.

We took tea at the New Inn, Gloucester, filled our tank, and set out into the inky darkness for Bristol.

For miles we hummed along merrily on the $3\frac{1}{2}$ to 1 top gear, a couple of F.R.S. lamps throwing a fine light well ahead, though one for some unaccountable reason went out regularly every ten miles or so. We could only think it due to the lamp being so much below the level of the generator. We had not done with the rain yet, and once again we had recourse to double waterproofing. We were covering ground rapidly and silently, but to our surprise when nearing Bristol the engine suddenly released itself, roaring round in the free position. What's wrong? we asked each other simultaneously, and found that the gear had come out of engagement, nor would it stay in for any length of time.

On the four-speed Clyno which Frank Smith has used in all the important trials this year, there is a pair of gears, that is, each two speed is independent of the other. The standard gear is embodied in a shell of the counter-shaft, and one or other of the gears is engaged by a rocking pedal which actuates

expanding rings. On the left-hand side of the machine is the auxiliary gear, composed of double chains and sprockets from the engine to the counter-shaft; a dog clutch slides on a square of the shaft, and so locks the smaller or larger chain wheel to the counter-shaft. Thus four gears are obtained, all having a direct drive, and any special ratio or ratios of gear may be employed. This auxiliary gear has done extremely severe work in the Scottish and other trials, and the corners of the dogs had got worn, and that was why

(1) The 1912 model four-speed Clyno with "Dreadnought" coachbuilt sidecar.
(2) Climbing Cheddar Gorge.

they came out of engagement. The only thing to do was to hold the top speed in by hand. But even steering with one hand in grease is not dangerous with a rigid sidecar; probably there is no safer vehicle on the road. The miles of Bristol tramlines gave us every opportunity of testing the stability of the Clyno.

A Record Hill-climbing Expedition.—

At the Queen's Hotel we were joined by our photographer, F. H. Roper, who had ridden down from town on his two-speed Premier. Our day's mileage on the sidecar was 125.

The next day broke fine, but soon the rain came down with renewed vigour. I had arranged to spend the morning examining the new model Douglas motor cycles at the Kingswood Works.

foot of the Gorge, and then approached the S corner at legal limit speed, changing down on the steep gradient between towering cliffs, and accelerated again in fine style all the way to the summit, never a knock issuing from the engine from start to finish. A notable point in connection with the climbing of the Clyno is its silence. No cut-out is used, or indeed necessary. Separate silencers are fitted, and a long pipe joining the two extends to the rear axle, and the result is a

ASCENDING
PORLOCK HILL, SOMERSETSHIRE.

Which is considered to be the worst main road hill in the country. (1) At the first bend. (2 and 3) The second bend to the left. (4) Descending Countisbury. Observe the winter coating of thick mud.

Westward Ho!

Somehow we missed the way out of Bristol via Clifton, finding ourselves on marsh land, with huge pools of water, into one of which our engine dipped. Eventually we joined the Bedminster Road, and, free-wheeling down Red Hill in the treacherous grease, entered Langford just in time to see Roper perform a magnificent pirouette, finally sitting down with his machine on top of him. Straightening out footrests and pedals occupied some little time, so, as it was impossible to reach Porlock that evening as we had intended, we decided to branch off to the left for Cheddar and climb the gorge, leaving Porlock for the morrow. The gear trouble was still existent, and to relieve his hand, our driver dropped down to the lower gears, but the engine did not seem to mind it in the slightest. As an instance, we made a non-stop run from Langford to the summit of the Mendips, using the third and fourth speeds for six miles to the

most effective silencing arrangement. Dropping down the Gorge in the gathering gloom, we lit lamps in Cheddar, and winding through Axbridge, pointed for Bridgwater. Next morning we enlisted the services of T. Hamlin and Co. to grind squares on the clutch dogs, and that firm made a quick and excellent repair, and we were on our way again at noon. Crossing the bridge and passing the statue of Robert Blake on our left, we lost no time in reaching Minehead, noticing on our way a signpost to Spaxton and the infamous Agapemone. The occasional glimpses of the Bristol Channel were a foretaste of what we were to see in Devon. Of course it rained at intervals, and it was much too misty to discern the Welsh coastline as we did on the return run, the Bristol Channel at this point being only about twelve miles across.

At Minehead we deemed it advisable to lighten our cargo as much as possible, as we were nearing our objective—Porlock—so we relieved the heavy coach-

A Record Hill-climbing Expedition.—

built sidecar of our baggage. The road to Porlock is narrow and tortuous, and we had perforce to make slow progress. In the village we waited for the photographer to take up his position at the bend. The villagers smiled very knowingly as they ascertained our plans. The news spread quickly, and there were nearly fifty who witnessed our dash heavenwards. A couple of charges of oil, a dig at the kick starter, and with a hint from the driver to be ready to put all my weight on the driving wheel, we commenced the long climb. Let me whisper it—I had heard so much of the impossibility of climbing the hill in winter that I had folded up the sidecar apron and left the door undone ready to do a mighty spring

out of the seats. I hardly dare glance upward, for it seemed to me that there was a danger of the machine toppling over backwards. Every tube of the frame was being strained to the uttermost. We swung bodily from one side of the road to the other; occasionally the machine refused to answer to the direction the front wheel pointed, and we found ourselves slithering along the ditch. What a long hill it seemed! Smith yelled out instructions excitedly as occasionally the back wheel spun round in the thick red mud, hurling a shower of mud and stones down the hill. We had to be quick to act or the machine would have stopped. Now came the second bend to the left, probably on steeper gradient than the first, and certainly of worse surface. Skidding round, we put our combined

LYNTON HILL, LYNMOUTH. The gradient at this hairpin bend is approximately 1 in 4, the hill averaging 1 in 6 for half a mile. Inset, a view of the Clyno approaching the corner.

should the machine commence to run backwards. The Contour Road Book describes this road as the worst in the South of England. The surface is like a river bed. The first stretch is comparatively easy, but by the time the hairpin corner to the right is reached, the gradient is appalling. Frank Smith took the corner close in to avoid the deep mud and ruts churned up by the wheel skids of the carts, but the gradient is much steeper at this point, and I confess to a feeling of fright as the front wheel rose up to a level with my eyes. The back wheel commenced to slip; we were coming to a standstill. "Lean over," yelled the driver, as he stood on the pedal to hold the $1\frac{1}{2}$ to 1 gear in engagement, what time the engine roared round belching clouds of smoke. Keeping the front wheel as best he could in the rain-washed ruts, we progressed upwards, the rough surface bumping us

weights on the back wheel. The machine lurched forward as the wheel gripped for a moment or two, only to slither suddenly to the left. The sidecar wheel mounted the banking, and with the bicycle wheels in a deep rut, we felt the engine bump the ground. But the worst part was nearly over, the gradient eased to 1 in 5 or 6, the engine was still doing its best, and as we once more resumed our ordinary attitudes we felt that our object was achieved. Another mile of constant climbing, rendered more difficult by a gale which blew in our teeth, and we were at the top of Exmoor, 1,378 feet above sea level. Immediately the rain came down in torrents and we had to grin and bear it until the photographer came along the new 6d. toll road which avoids the dreaded ascent of Porlock. We had done as much damage to the driving tyre as if we had used it 1,000 miles. A

A Record Hill-climbing Expedition.—

new $2\frac{1}{2}$ in. Palmer rubber-studded cover was fitted for the trip. It was perfect at the foot of Porlock, but at the top the centre row of studs had disappeared.

The Descent of Countisbury.

Continuing with the rolling hills of Exmoor on our left, we passed the county boundary into Glorious Devonshire, and after several miles of undulating roads, ever twisty, on the one side heather-grown moorland, on the other magnificent seascapes, we came to the summit of Countisbury, and now commenced a thousand feet drop to sea level. Occasionally we paused to admire the magnificent panorama of rugged coastline. The surface of Countisbury was surprisingly good, except near the foot under overhanging trees. Here it was just as bad as it could be. But how we enjoyed the scenery as we descended into Lynmouth! The sea was choppy and the waves dashed high as they lashed themselves into foam on the rocky beach. Using the engine as a brake, we had no difficulty in getting down, but the photographer was not so fortunate. He had broken his footrest, and so used his foot as an extra check. By the time he got to Lynmouth he had no heel on his boot and the sole was worn through, so his first duty was to seek a bootshop. There was time to attempt Lynton Hill before dark, and again, without troubling to inspect the hill, we started our upward flight, and in less than 100 yards struck the steepest and worst corner I have ever seen. It so happens that there is room to swing out, but inside the corner the gradient must be 1 in 2. Lynton proved almost as difficult as Porlock, and we had to adopt the same tactics to get up. The mud here is of a different consistency—white chalky slime, difficult to walk upon; consequently we had still more difficulty in securing a grip for the back wheel, and to make matters worse the machine would go its own way. It was only possible to steer a fairly straight course with the handle-bars pointing sharp to the right. In my acrobatic position, holding all my weight on the carrier, I could smell burning rubber as the wheel spun round on the greasy surface nearly all the way up. Once to ease the strain on my arms I released some of my weight. "We're stopping," the driver yelled out, and I immediately applied all I knew to the carrier, the effect of which was to cause the front wheel to jump a foot in the air, so I am told. When at length we had conquered the half-mile of 1 in 6 (to avoid which there is a lift for cars costing one guinea), the driver's legs were stiff and ached through standing on the gear pedal. *There was not a single stud left on the tyre*, which knocked on the head all idea of attempting Barbrook Mill Hill. Descending the hill at a crawl was almost as exciting as the ascent, for occasionally the squeaking brakes would bring the wheels to a standstill, and the whole machine would slide bodily forward with the wheels locked. That night we spent comfortably at the Lyndale Hotel, the rushing waters of the Lyn under our bedroom windows acting as a lullaby.

Lynmouth is in a dip, and to get out there is Lynton or Countisbury Hills to climb. The latter was to be our last ascent of note, and after 250 yards of severe gradient, our slithering and acrobatic performances on the rear wheel being repeated, the Clyno took the middle gears without complaint, and the rest was plain sailing. The road is very narrow,

and near the top high banks obscure the view of approaching traffic. We nearly collided with a tourist from Uxbridge with a Triumph and sidecar, who was on his wrong side, but we freely forgave him, for we all stopped and had a most interesting chat. We enquired how they got out of Lynmouth on a single-gear sidecar, and learned that there was a roundabout way *via* the Doone Valley.

At Minehead we picked up our baggage, but were constantly delayed by grooms exercising stag hunters and polo ponies on the road. We resolved to miss lunch. Through Bridgwater to Cheddar the going was without incident—we decided to include the Mendip Hills a second time—but at the foot of the gorge the back tyre deflated, which delayed us half an hour. This time we climbed the S corner on the second speed. A weak place in the joint of the back tube caused another halt, and it was dark when we drove into Bristol, so our chances of reaching Coventry *via* Birdlip—109 miles—were becoming remote. We sped silently through the darkness to Gloucester, on three occasions having to apply brakes suddenly—once for a timber lorry which had a great tree trunk projecting rearwards for a dozen yards, another time for a traction engine and trailer without a rear light, and lastly for a patch of unrolled stones without a warning light. It came on to rain again—real rain this time, which made our faces smart—so we elected to put up at the Bell, Gloucester.

Birdlip Climbed in Pouring Rain.

Rising early next morning, we learned that it had been raining all night, and how relieved I was to think that the good Clyno was indifferent to tramlines or grease, and that the luxurious boat-shaped sidecar with its storm apron was practically waterproof. Getting on to the Cirencester road, we took Birdlip on the run, the rain pelting down ceaselessly. It will afford some idea for comparison with the Devonshire hills when I say that on Birdlip as well as Farlow there was no difficulty in the driving wheel securing sufficient adhesion. Frank Smith changed gear quite ordinarily, and I sat comfortably in the sidecar as if we were on level ground. Between the corner and the last section of 1 in 6 the Jones speedometer showed 20 m.p.h. Descending Leckhampton, we ascended Cleeve Hill, Cheltenham, on the two top gears—a sure sign that the engine had lost none of its power. It stopped raining hereabouts. Nearing Evesham the front tube also developed a weak spot, but this was our only involuntary stop during the seventy-five miles run to the City of the Three Spires, where we arrived at midday. Before parting, we weighed the combination with passengers, and it proved to be 7 cwt. 3 qrs. One must allow several pounds of this for the excellent chain guards, upon which the mud of seven counties was piled in thick layers. But what an achievement for a 76×82 mm. twin! A $14\frac{1}{2}$ to 1 gear is certainly low, but how many air-cooled engines would take such a gear? As for the engine, nothing could have given more satisfaction. If any air-cooled engine is proof against overheating, it is the low compression Clyno. We never saw a plug or had occasion to remove the valve covers, and I noticed particularly the cleanliness of the crank case, despite the many miles of gruelling low gear work.

GEOFFREY SMITH.

Occasional Comments

By "Izion"

Rear Springing.

It is a little discouraging to see that in their concentration upon other items of admitted importance the trade is neglecting the question of rear springing. I believe efficient rear springing to be vital to a large trade overseas; this belief is not founded upon any personal fads of my own, but upon the unanimous testimony of a large foreign correspondence. Letter after letter clamours for insulation from rear road wheel shocks. Moreover, an unsuspectedly large proportion of the home riders insist on the same point.

Last week I received several letters from counties credited with quite decent roads, all pressing this same demand. So long as motor cycles were used only for pleasure touring, they did their work on our excellent main roads, and the back wheel slithered fairly evenly over well rolled macadam. But to-day motor cycles are being used for business purposes by all and sundry; herein lies the strength of the demand and the promise of the boom. Some commercial users are long-distance men, and are able, like the tourists, to confine their journeys to main roads; but the majority are compelled to travel along very indifferent byroads, and they all ask for rear springing.

Letters last week from such towns as Carlisle, Torquay, Newbury, Durham, Brecon, and Buxton all enquired whether I knew of any 1912 machine which would be distinctly better sprung than the 1911 standards. I should say all these places were lucky in their roads; but quite youthful commercial riders, after twelve months' riding with a rigid rear frame, make loud complaints. The matter is much more urgent from the standpoint of the overseas trade. Great Britain is the only country producing motor cycles in large quantities and ignoring the point. The last issue of an American journal devotes nearly five pages to drawings and descriptions of an insulated and sprung saddle. The saddle is carried on a tube hinged to a frame clip on the top rail of the frame in front, and working against double springs in the saddle pillar tube behind.

A German firm which makes a speciality of export orders, and has beaten home makers in some British dependencies, has a completely sprung rear frame, and so on. Old England must wake up. First-class workmanship, efficient engines, and reliable gears are well enough, but their excellence makes our callous neglect of staring gaps in our specifications all the less pardonable.

The Springing of Runabouts.

Several overseas correspondents enquire whether the average quadcar is better sprung than the average bicycle. The question is unanswerable in this broad form. Probably the average runabout is less comfortable on bad roads than a good bicycle, especially if it be a three-track vehicle. It is an awkward problem to devise proper springing for the rear wheel of a

tricar—so awkward that I question whether it has ever been solved yet.

The great problem of quadcar design is to keep down the price, so as to avoid competition with the small car, new or second-hand, and this is likely to prevent efficient solution of such a problem as springing, which in a country of good roads like England is frankly regarded as a secondary problem. Moreover, the design of these light passenger vehicles is far from stereotyped at present, and it is impossible to treat of them in general terms. On the whole, few of the present models are as comfortable as a good motor bicycle on any roads.

Farlow Bank.

The wiseacres criticise the A.C.U. for including this freak ascent in a Quarterly Trial. Surely motor cycles are sufficiently established nowadays to stand a little frank criticism. We all know that standard machines are tolerably helpless when faced by such freak ascents; and the go-anywhere business rider is often confronted by miniature Farlows.

If crack experts cannot coax the modern machine up Farlow, the daily traveller along by-roads is certain to meet with many exasperating failures on much less formidable hills, especially in certain districts, among which I may mention the whole of Wales, Scotland, Devon, Cornwall, and Durham.

The sooner the standard types are developed until they are fearless of such hills the better; and the A.C.U. is performing a real public service in continually reminding the trade of the fact that finality is not yet reached. I have spent two days this summer looking for freak hills, with parties of ordinary amateur riders on standard machines. One day our search failed; the worst climb we unearthed was a plain straightforward ascent, including no really bad gradient, yet only seven men out of twenty-six made clean ascents at the first time of asking; at a second attempt, with reduced gears, twenty-one got up.

The other day provided a hill with no outrageous gradient at all; it was a very short ascent with bad surface and bad turns. On this occasion only the variably-gearied brigade were able to get up at all. The 6 to 1 ratios of the ordinary $3\frac{1}{2}$ h.p. adjustable pulleys were useless with timid and inexperienced riders up.

I myself rode this hill on five or six different makes of machine, and it was interesting to notice that the variably-gearied lightweights proved the easiest to handle on such a climb. Much greater effort, courage, and skill were required to make a safe ascent with a variably-gearied $3\frac{1}{2}$ h.p., or with a two-speeded 8 h.p. I suppose my wrists found it easier to steer a lightweight than a heavyweight, when the stones were jerking both wheels in every direction save that whither the strip of granite that posed as a road was tending. The real secret is that skill and intrepidity, or a variable gear with a very low bottom ratio, are required for these freak inclines.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Oil-tight Crank Cases.

[6001.]-I notice that "Ixion" finds difficulty in keeping the joints of his crank case oil-tight. Has he tried asbestos paper jointing? This will keep boiler mountings steam-tight against 200 lbs. per square inch pressure, though the mountings are not so very accurately surfaced, and the parts of the boiler against which they fit are often badly pitted. It is wonderful what a good fitter can accomplish with file and scraper, and the state of the surfaces of his crank case must be bad indeed if it is beyond the power of hand tools to make the joints oil-tight.

D. S. HOLMES.

A "Farlow Bank" in the Manchester District.

[6002.]-I wonder if any of the Manchester motor cyclists are aware of a Farlow Bank in their district, in fact, within twenty miles of the city.

It is called "Buxton Stoupe," and is situated between Bollington and Jenkyn Chapel near Buxton. The road is in fairly decent condition, and the hill commences with a hundred yards or so of 1 in 4 gradient, and has two very nasty corners which I expect causes most single-gear machines to "conk" out.

For the more ambitious riders the best route is to go by way of Whaley Bridge and Long Hill down to Goyt's Bridge, and over Pym Chair to Jenkyn Chapel, and straight on to Buxton House.

I have had two attempts at the hill, mounted on a 2½ h.p. two-speed Douglas, and at the first successfully climbed the hill, but failed at the second, due to the slippery state of the road surface.

GEORGE H. SHAW.

Will the Ultra-Lightweight Return?

[6003.]-In reading through my copy of *The Motor Cycle*, I notice that Mr. D. C. Bolton rides a 1 h.p. bicycle fitted with a J.A.P. engine, and as this seems to me to be a step in the right direction I take this opportunity to state why.

To the army of motor cyclists already existing there could be added a vast number who are most anxious to join in were it not that the price of an up to date machine is prohibitive, and as they are not "mechanically inclined" hesitate to purchase a second-hand machine for the reasons expressed by friends of my own—"I should not know where to look for mechanical faults." Surely such a machine as Mr. Bolton rode at Brooklands could be built to sell at just under £20. Any ordinary good make of heavy push bicycle should be capable of carrying it, and this can now be bought for from £6 to £8. Such a machine should be capable of maintaining an average speed of 12 m.p.h., and I feel positive that that speed would suit a great number. As regards upkeep this will be extremely low.

Let some enterprising maker of good repute come to the rescue with a very light machine (about 50 lbs. and of 1 h.p.) capable of averaging 12 m.p.h., and able to take the ordinary hills found on a give-and-take road with a small amount of pedal assistance. Let him advertise the fact, and I think that the result would be surprising.

I have in my mind at the time of writing the pleasant memory of a short run on a 1½ h.p. Clément-Garrard I once had, and the surprise I had at the manner in which it "romped" up a short stiff hill without being rushed at it. The reason, I presume, it was not taken up more largely by the class I mention was that the pastime had not claimed anything like the position that it holds to-day.

ALEC W. STANBROUGH.

Quality of Modern Tyres.

[6004.]-It certainly appears that some of your correspondents have been extremely unlucky with tyres, and I cannot help thinking that it is, to a certain extent, their own fault, for given fair play, any of the leading makes should give at least 3,000 miles before showing signs of giving in.

I am continually on the road with a 3½ h.p. Singer, and the tyre I have just taken off my back wheel, a Michelin Trident, ran 5,137 miles, and this in Dorset, Somerset, Cornwall, Devon, and the New Forest, over very bad roads, and in this mileage I only had seven punctures. I never failed to examine my covers after a long run, and possibly that, and the fact that all cuts and gashes were promptly attended to, explains my immunity from tyre trouble. I would add that my average speed is twenty miles per hour and weight of driver and luggage over fifteen stones.

A. G. MASON.

Stands as Nail Catchers.

[6005.]-In a recent long distance ride I fitted an ordinary steel burnisher to each cover. In running 2,000 miles I had only one puncture. The burnishers wore out in about this distance, and I did not bother fitting new ones. The consequence was that I had no less than five punctures in a fortnight. I decided to fit burnishers again, and am delighted to say that I have had no punctures since refitting, clearly proving that they are a good preventive.

I might say that I use a ribbed cover. I do not think it possible to use this type of nail catcher with studded covers, as the studs pull the burnishers all to pieces. The method of fitting is simply to drill two small holes through each side of the mudguard and let them hang on to the tyre. They can be secured by ordinary copper wire.

H. V. SWIFT.

THE FASCINATION OF SIDECARING.

Miss Daisy Jerome, the celebrated music hall artiste. Whilst at Bath recently, Miss Jerome tried Eric Longden's 8 h.p. Dot and sidecar, and was so delighted with her experience that she sent her 40 h.n. car to London, empty, in order to have a longer run on the sidecar.

Cold Vulcanising.

[6006.]-"Retread" in his letter [5968] draws attention to a matter which must often puzzle motor cyclists who have tyres retreaded. Cold vulcanising is a definite process, and not another name for solutioning. Within certain limits it is quite successful. As "Retread" has found out, it is not successful on all makes of tyres. I have seen some tyres retreaded by this process in which the new tread came away entirely from the tyre inside 500 miles. On the other hand, I have had retreads adhere perfectly until they were completely worn through and still show no sign of leaving the tyre at the sides or tread up to the time the tyre itself was completely worn out.

One great advantage of retreading is that the band seems to possess at least double the wearing qualities of the original rubber, and also resists puncturing material to a marked degree. Generally speaking, retreads adhere best to tyres of which the rubber is of a soft nature. It naturally follows that retreads cannot be expected to adhere perfectly to perished or hardened tyres. HAROLD KARSLAKE.

A Magneto Experience.

[6007.]-I have just experienced a peculiar case of magneto trouble. Upon approaching a hill I opened the throttle and air sufficiently to take the hill. The engine would pull very feebly, but suddenly, without touching anything, would commence to pull well, and would knock the speedometer up 10 m.p.h. I naturally put this down to a dirty carburetter, but upon taking it down I found it to be perfectly clean. I then tried new valve springs, different plugs, new needle valve, and even after having the engine down there was no improvement. I eventually traced the trouble to the fibre block on the bell crank lever of the contact breaker being loose.

At times it would slip out of place and open the points about double the distance they should be; then it would suddenly slip into place, allow the points to open the correct width, and in this way allow the engine to pull with its usual vim.

As this is the first case of the kind I have heard of, I thought perhaps it would interest your readers.

ARTHUR H. MOYLE.

Formulae for Hill-climbs.

[6008.]-With further reference to the much-debated question of a suitable formula for figure of merit in hill-climbs, it is acknowledged generally that the A.C.U. formula does not give time sufficient value. The time factor is somewhere between T and T^2 .

$\frac{CT^2}{W}$ appears to give a more satisfactory result than $\frac{CT}{W}$ but, in the opinion of many, it gives fast time more than its share. The following formula has been devised, taking into account the several factors and their relative values of weight lifting, road resistance, and air resistance:

$$\text{Figure of merit} = \frac{CT}{W} \left(\frac{T^2}{T^2 + K} \right), \text{ or } \frac{C}{W} \left(\frac{T^3}{T^2 + K} \right)$$

K is a constant to be worked out for each hill, and has the following value:

$$K = \frac{d^2 s}{750(s+30)}$$

d = distance or length of course in yards

s = average length for use of 1; that is, if gradient is 1 in 12, $s = 12$.

As an example: $d = 1,100$, $s = 12$. then

$$K = \frac{1,100 \times 1,100 \times 12}{750 \times 42} = 461.$$

Figure of merit for this hill

$$= \frac{CT}{W} \left(\frac{T^2}{T^2 + 461} \right) \text{ or } \frac{C}{W} \left(\frac{T^3}{T^2 + 461} \right)$$

Many pocket books give tables of squares and cubes of numbers up to 1,000, which may be utilised to simplify calculation. Thus, suppose time in seconds is 46.4, that is 46.8. From tables, square of 46.8 = 2190.24, therefore square of 46.8 = 2190. cube of 46.8 = 102503.232, therefore cube of 46.8 = 102503. The odd fractions may be neglected, as they would not appreciably affect the result.

With regard to all types of multi cylinder engines, they should compete on equal terms with single cylinders, that is, on the basis of total capacity. J.W.

Motor Cycles Booming in Ceylon.

[6009.]-The boom in England is being reflected in Ceylon, where motor cycles are at a premium at present owing to the long time taken to deliver. Standard home machines seem to suit this country and climate very well. The roads are not quite good enough for sidecars, though they are not very bad. I have not heard of any trouble being experienced with modern machines, and I am of opinion that a great deal of the talk about colonial models is bunkum.

This, by the way, is the second motor cycle boom in Ceylon. The first took place in 1904, when there were 122 motor cycles in the island. After that motor cycling dropped off altogether, and did not resuscitate till 1910. The motor cycle is in growing use by European members of the staffs of the large mercantile houses in Colombo who ride to their offices on them daily from the suburbs.

Ceylon motor cyclists about to start for the office in Colombo. The machines are a Bradbury, Premier, Indian, and Douglas.

Enclosed is a photograph of four motor cyclists, who live together in a bungalow at the seaside, just about to start for the office in the morning.

Colombo.

P. JONES.

Twin Engines and Sooted Plugs.

[6010.]-I have had the same trouble with a well-known 5 h.p. sidecar machine. Two months ago I fitted a large silencer and long exhaust pipe to make the machine quieter, and since then I have never had the plugs out. No other alteration has been made, so that I attribute the improvement to the gases not being confined in the cylinder and having more chance to clear the exhaust. My plugs are situated in bad positions, viz., on the side of the piston top. Has any other rider tried this dodge?

WORKING MAN.

[6011.]-I was much interested in "Would-be Twin's" letter in your issue of the 19th ult. re unequal lubrication and the fouling of plugs of twin-cylinder engines, having experienced the same trouble myself. At pottering speeds under average conditions the lubrication was apparently satisfactory, but if a good speed was maintained for some distance and everything thoroughly warmed up, the amount of oil required to ensure the front cylinder getting sufficient was always enough to make the back cylinder dirty and probably foul the plug. I tried several makes of plugs which were advertised not to foul, but I regret to say that none of them made any attempt to keep up their reputations. My plugs are in the position recommended in your editorial note, viz., on top and in the centre of the combustion head. As the machine was in all other respects very satisfactory, I determined to try and improve this unequal lubrication.

My first step was to remove entirely the baffles under the front cylinder and still further baffle the back one. This improved matters slightly, but still the back cylinder was getting too much. The next move was to drill the wall of the front cylinder and fit a union piece to take a branch

from the main oil pipe, which pipe, I may say, feeds as usual into the crank case in front of the front cylinder. This oil hole in the cylinder wall was so arranged that, with the piston at the bottom of the stroke, it came opposite the bottom ring of the three and was, of course, uncovered when the piston was at the top of the stroke. This improved matters considerably, and I have since then taken off the bottom ring so that the groove acts as an oil receiver and distributes it round the piston. Further, I have reduced the hole in the crank case pipe union to $\frac{1}{16}$ in. so that a large proportion of the charge is sent *via* the front cylinder into the crank case, and the lubrication is now about equal in both cylinders. It is some time now since I had a fouled plug, and I examined the plugs after a recent 300 miles week-end run and found both perfectly dry and clean.

I have often compared notes with other riders of twins on this subject, and, although in many cases their report is fairly satisfactory, a great number have trouble with the back cylinder. Strangely enough, some of them seem to get their surplus of oil into the front cylinder. This lubrication question is undoubtedly one which deserves and will receive greater attention, and no doubt before long "Would-be Twin" will need to have no fear to renew acquaintance with the delightful twin. N.F.

Wanted, a Motor Cycle for British East Africa.

[6012.]—I have had a letter from a client in British East Africa asking me to send out to him catalogues of motor cycles, trailers and sidecars which I think would be suitable for such work as native paths and station roads, etc.

My impression is that any of the standard makes of machines would be suitable with practically no alterations. Climatic conditions are not so very unlike those in England, so that carburation troubles from this cause are improbable, while tyre troubles would be no worse than in India; but clearance and general strength is important.

As it is likely that some makers may specialise in this class of work, I should be much obliged if any makers interested would send me their catalogues, with prices and particulars of their colonial and other models, so that I may study them and report. I should be very glad if you, sir, could find a corner in your paper for this query.

O. PAUL MÖNCKTON.

Analysis of Carbon Deposit.

[6013.]—Having occasion to remove the carbon from the inside of the piston of a $2\frac{3}{4}$ h.p. motor cycle engine I thought of collecting same when I, unfortunately, had thrown it nearly all away. Having, however, managed to get together about $1\frac{1}{2}$ grammes, I proceeded (as far as a small amount would allow) to determine the chemical composition of the ash, after ignition of the carbonaceous residue. The result is shown below; while the first two items of carbon and ash may be taken as accurate, the small amount of ash (.23 gramme) at disposal makes the quantities of matter present a little difficult to determine other than approximate.

While examining the ash I noticed the presence of metallic particles, which may possibly account for the disappearance of small pieces of piston ring, which has puzzled some of your readers.

ANALYSIS OF CARBON.—Dried at 100° C. Volatile oils and fixed carbon, 84.7%; residual ash, 15.3%. Composition of ash: Silica 2%; iron, 9%; copper, 0.3%; zinc, 0.2%; magnesia, 0.5%.

AO 302.

[There appears to be an omission in the figures giving the composition of the ash.—Ed.]

Variable Gears for Motor Cycles.

[6014.]—Your contributor "Auriga" who is writing articles on the above subject has omitted an advantage possessed by hub gears, epicyclic or otherwise, with direct belt drive, namely, that the ratio of gear between engine and belt rim can be easily and quickly altered by means of the adjustable pulley.

I should say ninety per cent. of motor cyclists using sidecars do a good deal of solo riding on the same machine, in which case it is desirable to be able to alter the top gear from, say, $5\frac{1}{2}$ to 1 for sidecar use to $4\frac{1}{4}$ to 1 for solo work, with as little trouble as possible. This is a lengthy

and dirty job in the case of counter-shaft gears with chain drive, necessitating in some instances the dismantling of the counter-shaft. The substitution of a pair of sprockets and altering the length of engine chain is the work required to be done even where the final drive is by belt, as from published data it would seem all the combined chain and belt machines have a fixed belt pulley. I presume we shall have to wait patiently until the end of next year when makers will be putting forward adjustable counter-shaft belt pulleys as a 1913 improvement!

The usual disclaimer must be added. H. M. STICH.

[The undoubted advantage mentioned by Mr. H. M. Stich is one which is inherent in the V belt drive, and does not in any way concern the variable gear (properly so called), for it applies equally to a fixed geared machine: hence it was not included.—Ed.]

Cost of Running a $3\frac{1}{2}$ h.p. Motor Cycle.

[6015.]—I am thinking of buying a $3\frac{1}{2}$ h.p. single-cylinder motor cycle. Could any of your readers give me the average running cost per mile, including everything?

H.M.

[Although "H.M.'s" query could be answered by references to back numbers of *The Motor Cycle*, many prospective buyers would, no doubt, prefer recent experiences, and we shall, therefore, be glad to publish a few readers' replies to the query.—Ed.]

A Stone Remover and Tyre Protector.

[6016.]—I enclose particulars and drawing of a stone remover and tyre protector which was made and fitted to my Douglas last April, and which has been in use ever since. The machine has done about 5,000 miles, and tyre troubles, so far as the back wheel is concerned, have been non-existent. I use my machine chiefly for business purposes throughout the Midlands, and especially in the colliery districts, where the by-roads and lanes are none too good, and prior to the

The Stone Remover referred to in accompanying letter.

A. Sheet steel protector. B. Springs. C. Hinged plate. D. Swivel hook. E. Coil spring in tension. F. Clips.

protector being fitted I was continually having trouble with my back tyres in the way of cuts and gashes. I am pleased to say that now these troubles are a thing of the past, and a Dunlop rubber-studded cover, which has been in use for over 2,000 miles, is entirely free from scratches or cuts of any kind, although during a recent fortnight's holiday in and around Berkshire I was repeatedly travelling over country roads and lanes which, in places, were plentifully bestrewn with loose flints.

When one meets roads such as I have alluded to it is a pleasure to hear the stone remover at work and to feel that one is practically immune from a serious cut in the back tyre of one's machine.

To prevent small punctures, I have for some considerable time used Firmax, so that with this inside and the stone remover outside, I take my journeys feeling that I am more or less free of the puncture fiend at any rate. Personally, I should be very sorry to take a lengthy journey without the protector, as besides doing what is already claimed for it above, it also has the merit of keeping a good deal of mud away from the back wheel and adjacent parts.

E. J. JEWELL.

Herts County Speed Trials.

[6017].—On page 1123 of your last issue there is a paragraph to the effect that, on the occasion of the recent speed trials promoted by the Herts County A.C. at Luton, the A.C.U. was severely criticised owing to Mr. W. H. Bashall being disqualified for only having one brake fitted to his machine. I quite fail to understand why the A.C.U. should be criticised at all in this matter; the only connection it had with these trials was to grant the permit, and if the officials of the club choose, rightly or wrongly, to disqualify a competitor, it is no fault of the Auto Cycle Union.

F. STRAIGHT, Secretary.

A Plea from Colombo.

[6018].—May I be permitted to make use of your columns to suggest the advisability of your advertisers making a habit of inserting prices in their advertisements, the omission of which often necessitates the colonial rider writing to England for a catalogue and waiting possibly six weeks or more for its arrival. "Priceless" advertisements are constantly ignored by those in search of some accessory or other, while those makers who are more explicit get the order.

The pastime is distinctly on the boom here just now, and the local agents have got their deliveries booked up for some time to come.

Colombo, Ceylon.

L4.

**3,000 MILES IN THREE WEEKS.**

F. E. Pither, who has commenced an attempt to cover 3,000 miles on the road in three weeks on a $3\frac{1}{2}$ h.p. Rudge and Portland sidecar. Extremely bad weather has been encountered.

The A.C.U. and the Liverpool A.C.C.

[6019].—My letter *re* the above has apparently brought about a flood of correspondence that shows there is disaffection in all parts of the country on the point.

To my mind, the A.C.U. organisation is all right so far as it goes, but it appears to foster trade matters too much, and forgets that it is the amateur who wins competitions who gives the manufacturer the best advertisement. What clubman or amateur cares a rap about results of Quarterly Trials, or such events, when the trade riders form the principal entrants. If a trade rider cannot pull his up-to-date machine through such events as the trials, what chance does the amateur stand who rides a similar mount?

The A.C.U. competitions are no earthly use to provincial clubs, as the latter can only hold competitions at week-ends, and so cannot travel from one end of the country to another to enter such events, so provincial clubs must organise open competitions in their own districts, to be controlled by the new organisation that is now suggested by your correspondents.

It appears to me that three centres will be required—Northern, Midland, and Southern.

Of course, it must be understood that the competitions to be held must be "open" in the true sense of the word, and

that the trade be given every facility to enter, so that we can see in our own districts the exploits of the various machines in the hands of trade men.

Club reliability trials are very enjoyable competitions, but unless there are a large number of entries they lose their interest, and these events should be open to all and sundry, but they must be divided into classes.

E. W. KURKOPP.

The Track at New Brighton.

[6020].—I note with much amusement Mr. Baxter's remarks *re* the above track. Is Mr. Baxter aware that this track is the finest three-lap track in England, and suitable for speeds higher than Mr. Baxter has attained? Judging from his letter, the impossible has been accomplished when he did five miles in six and a half minutes. I would refer him to the Continental (three-lap) and American tracks, where higher speeds are obtained on machines with engines of far less cubical capacity than he owns. I would suggest that Mr. Baxter should try his luck on Brooklands. I am of the opinion there are plenty of motor cyclists in Liverpool who could equal if not beat Mr. Baxter's times on New Brighton track if they chose to try.

LIMELIGHT.

Counter-shaft Position.

[6021].—I notice several makers are designing and putting on the market for 1912 counter-shaft gears with combined chain and belt or gear and belt transmissions. Nearly all the new ones which I have seen described in your paper show the counter-shaft at the rear of the engine, and in the position usually occupied by the bottom bracket. With large belt pulleys the short belt drive may be fairly successful in dry weather, but as most of these gears are being marketed for passenger work I have doubts concerning the transmission efficiency in the wet, partly owing to the heavy torque passing through the belt on low gear, and also to the shortness of the belt centres requiring the belt to be unduly tight. Personally I cannot see any objection to placing the counter-shaft in front of the engine and the magneto behind, thereby obtaining longer centres for the belt and a smoother and more efficient transmission. The counter-shaft pulley if fitted in front can be equal in diameter to the rear counter-shaft pulley, when the results must be superior. Now that the date of the Show is so close a discussion on the subject would interest all motor cyclists.

LONG BELT DRIVE.

Wear of Big End Bearings.

[6022].—Referring to Mr. John Kennedy's letter dealing with the big ends of motor bicycle engines, I have seen a good deal of the same sort of thing, but he can rest assured that it will not be long before the fault which he is suffering from is remedied. The wonder is that the big ends last as long as they do under the conditions in which they work. The reason they wear out is not because of the speed they go at, but because they are not oiled. How anyone could expect oil to get properly into the big ends of a crankshaft revolving at three or four thousand revolutions per minute just because it happens to dip in a pool of oil at the bottom is difficult to understand. No doubt this oil soon gets churned up into a sort of oily fog, but I say it is impossible for this oil to get through a small hole and lubricate the crank pin properly, not merely grease it. The obvious and only proper remedy for this trouble is to have the oil pumped into the crankshaft with a small force pump working, say, at 60 to 100 lbs. pressure. The crank bearing can then be a loose fit, and the pressure will keep a volume of oil between the metallic surfaces and prevent practically any wear or noise. No doubt it costs a good deal more to produce an engine with this oiling system, but it will come sooner or later. In the few motor cycles I made years ago with four cylinders, I found this was a perfect cure.

MIDLAND INTER-CLUB RELIABILITY TRIAL.

56 Competitors in the Birmingham and Sutton Coldfield Club's Joint Event.

Scene at the start of the Birmingham M.C.C. and Sutton Coldfield A.C. Joint Reliability Trial for the P. J. Evans Trophy.

ON Saturday last a reliability trial open to members of the Birmingham M.C.C. and the Sutton Coldfield A.C. was held in the Midlands for a trophy presented by Mr. P. J. Evans, the Junior Tourist Trophy winner. Six other prizes were offered.

The start was from the Stratford Road tram terminus, Birmingham, at 2.30 p.m., and at that time fifty-six of the sixty-five entrants responded to the roll call. The competitors were despatched in pairs at half-minute intervals over the following route: Stratford-on-Avon, Sunrising Hill, down Edge Hill, Kineton, Wellesbourne Hastings (one hour stop for tea and to light lamps), Eatington, Sunrising Hill, Wellesbourne Hastings, and Stratford back to the starting point.

A non-stop run had to be made. Each competitor was awarded 1,000 marks at the start, from which marks were deducted as follows:

Failure to climb a hill	50
Peddalling or foot assistance on hills	25
Stop due to puncture	5
Any other involuntary stop	20
For each full minute early or late at controls	3

The above system of marking is a very sensible one, and proved popular. In many competitions—those organised by the A.C.U. in particular—a competitor who is unfortunate enough to puncture (which is a circumstance over which he has little or no control) is penalised as heavily as if he failed on a hill, which is certainly not as it should be.

All went merrily to Stratford, except that H. Goldman (Quadrant) and S. Smith (Norton) punctured, and E. A. Power (Forward) also stopped. A few miles out of Shakespeare's birthplace we came upon Messrs. R. V. C. Brook and P. J. Evans timing the secret check to decide the winner in case of a tie. Miss Hough and F. S. Whitworth, on Douglas machines, rode through together almost dead to time, as also the next couple, Miss Berend—who was mounted temporarily on a diamond frame three-speed Dene-

Precision—and J. Woodhouse (Dene-Precision). The day was fine and bright—particularly so for the time of year—and the run was much enjoyed. Nearing Sunrising, F. S. Whitworth dropped a glove, and John Gibson, who was riding with the competitors on his $3\frac{1}{2}$ h.p. three-speed Martin-Jap, dropped back and then scurried after Whitworth to restore his property. Reliability trials nowadays are uninteresting and valueless unless a severe hill is included, and on the occasion of this inter-club run Sunrising Hill was ascended—in more ways than one—and quite a new departure in connection with the rules which we have had in mind for some time was a night climb. After tea, by which time it was quite dark, competitors had once more to ascend Sunrising, with its difficult corner. This test proved most instructive; that is, to the fixed gear fraternity. We all know that a 1 in 6 gradient in daylight is nothing nowadays to a $3\frac{1}{2}$ h.p. mount provided it is allowed a clear path, but demand that the same engine shall climb the same gradient slowly with the same gear, and it will fail hopelessly.

The Ascent of Sunrising in Daylight.

To return to the first section of the journey, we noticed among others going particularly well F. A. McNab on a new model Trump-Jap, which looked very spick and span in its grey finish; H. V. Colver on the new 6 h.p. Enfield-Jap sidecar combination; J. Dudley on a three-speed Hobart, whose stand was trailing along the ground; James St. John on a 1912 three-speed New Hudson; and Bert Yates on a 1912 two-speed Eumber. Manning-Lomax, who was driving a sidecar propelled by a $3\frac{1}{2}$ h.p. B.S.A. with that company's new two-speed gear, unfortunately suffered a broken belt. On arrival at Sunrising there was the usual crop of failures, so many, in fact, that it became quite a task to note all the numbers as they came to a standstill at different points. Sunrising is five-eighths of a mile long, commences with a stretch of 1 in 8, then an easier stretch, a gradual turn to

Midland Inter-club Reliability Trial.

Miss L. Berend (3½ h.p. Dene-Precision) starting from the tram terminus.

the left, then a sudden twist to the right, the gradient steepening to 1 in 7, and culminating 200 yards higher up with a section of 1 in 6. Nearly every rider got round the bend, but the hot engines refused to pick up again. Miss Hough had not so much in hand on Sunrising as F. S. Whitworth, who switched off his Douglas occasionally to keep pace with her. Miss Berend went up splendidly on the Dene, and though she witnessed her companion Woodhouse on a single-gear machine forge ahead at the hill foot, she passed him later, as his engine pounded itself to a standstill. Among the best ascents, we noticed Seymour Smith (Norton), who picked up splendidly round the bend and finished at over legal limit; S. B. Mayell and T. Baxter (Triumphs); and F. Southam (Zenith). Others who made slow but sure climbs on their low gears were B. Yates and S. Wright on 3½ h.p. Humbers, R. H. Viggers (Enfield), W. B. Gibb (Douglas), H. J. Cox (Forward), R. W. Duke (Zenith), T. Hampson (Matchless and sidecar), and Colver on the New Enfield. J. Dudley (Hobart) indulged in light pedalling. In all there were eighteen failures, including some real surprises.

After the competitors had passed, a non-competitor on a T.T. Triumph made a splendid ascent with a passenger seated on his carrier. The new twenty-speed Rudge with Mr. V. A. Holroyd, a sixteen stone rider, up, also made a creditable ascent.

The Night Ride.

It was a fine night but extremely cold, a new moon doing its best to brighten the outlook as competitors were despatched from Wellesbourne on the last stage. We can imagine the surprise of the villagers to see sixty bright lamps file past their cottages, to the tune of half-silenced Gathings guns. By the way, we thought several of the competitors' machines unduly noisy, and it would have done some good if the officials had noted the worst offenders and disqualified them.

It proved most difficult to observe the competitors on Sunrising in the dark, but the sight was a weird one ever to be remembered. We are inclined to think that some indulged in some useful digging with their feet which passed unnoticed. The stationary lights showed up the fallen ones; it was too steep for a competitor to push his machine single-handed to the top. Unfortunately, only one observer was on the hill at the proper time, though he got the names of several who failed, whilst others reported the stops themselves. Of course, so many types of lamps and generators being concerned, lamp troubles were not infrequent.

The night climb brought the number of failures on Sun rising to twenty-five, and in addition to these at least six managed to get up by pedalling or running a few yards alongside their machines. Passing the round tower at the summit of Edge Hills competitors again descended to Kineton, this time continuing to the finishing point. A number of competitors ran off the route, which counts as a stop. Miss Berend and Miss Hough had involuntary stops in the

darkness. J. Pollock (James) experienced a traffic stop in Stratford. McNah (Trump) had the high tension wire come off the plug. H. Sheldon (Regal) broke a valve. H. J. Cox (Forward) sooted plug, and H. V. Colver (Enfield) retired.

The Results.

Non-stops were credited to the following:

Dr. B. Fawssett (8 Chater-Lea-Jap and sc.).	V. Busby (2½ h.p. Humber).
R. H. Edwards (Triumph).	H. J. Woodgate (3½ Singer).
T. Hampson (Matchless and sc.).	V. Underhill (3½ Norton).
R. H. Viggers (2½ Enfield).	W. B. Gibb (2½ Douglas).
K. Holden (3½ B.S.A.).	J. H. Percox (3½ Alldays).
N. G. Blackwell (6 Zenith-Gradua).	E. Smith (4½ Regal-Precision and sc.).
S. A. Rowlandson (3½ Rudge).	R. W. Duke (3½ Zenith-Gradua).
F. P. Mayell (3½ Triumph).	S. Wright (3½ Humber).
F. H. Southam (6 Zenith-Gradua).	B. Yates (3½ Humber).
	A. Ryland (7 Matchless-Jap).
	J. Dudley (2½ h.p. Hobart).

Four of the above competitors were in the controls exactly to time, therefore the secret check had to be taken into account in order to determine the winner. The first five are as follows:

1. F. H. Southam (6 h.p. Zenith-Gradua), winner of the P. J. Evans trophy.
2. J. J. Woodgate (3½ h.p. two-speed Singer), Humber gold medal.
3. J. H. Percox (3½ h.p. two speed Alldays), Triumph gold medal.
4. N. G. Blackwell (6 h.p. Zenith-Gradua), C.A.P. carburetter.

Six competitors tied for the fifth place, each making non stops, with a time error of one minute. The secret check revealed that

5. W. B. Gibb (2½ h.p. Douglas), Lycett belt, was nearest with only 19s. error, the remaining five erring as under-noted:

R. W. Duke (3½ h.p. Zenith) ...	52s.
F. P. Mayell (3½ h.p. Triumph) ...	64s.
Dr. Fawssett (8 h.p. Chater-Lea and sidecar)...	82s.
K. Holden (3½ h.p. B.S.A.) ...	92s.
V. Busby (2½ h.p. Humber) ...	92s.

R. W. Duke takes the prize of a Lucas lamp, offered for the best performance by a member of the Birmingham Motor Cycle Club, and F. P. Mayell the Powell and Hammer lamp, for the best performance by a member of the Sutton Coldfield A.C.

The leaders—Miss N. Hough (2½ h.p. Douglas), F. S. Whitworth (2½ Douglas), and J. W. Woodhouse (3½ h.p. Dene-Precision)—passing over the river bridge at Stratford-on-Avon

Motor Cycle in the Jungle.

The Rev. A. M. Jenkin stated at Bangor that he was greatly assisted in his missionary work in Central Africa by a motor cycle. One night he almost ran into two lions, which were so frightened by the glare of the acetylene lamp that they "slithered off."

A Novel Exchange.

Among the replies to an advertisement by Mr. H. Fram hon. secretary of the Scarborough and District M.C., was the following tit-bit:

"Dear Sir,—I am in want of a good motor bike and could give you in exchange a good barrel organ, all the latest tunes, twenty-eight in all. If you will come over to York and give me a trial run to Wetherby and back, you can have a grind on my organ.—Yours truly, HENRY STEPHENSON, York."

A.C.U. Notes.

SIX DAYS TRIAL CLUB TEAM PRIZE.—Previous to the Six Days' Trials it was decided to award a club team prize to the best team provided a minimum of five entered. Only four clubs—Yeovil and District, N.W. London, Herts County, and Sheffield—sent teams, and the Union was therefore not bound to make any award. It has been nevertheless decided to present a silver cup to the Yeovil and District M.C.C. team, which made the best performance of the four entered. The team was composed as follows: P. W. Moffatt (2½ h.p. Douglas), J. Baker (3½ h.p. clutch Triumph), and C. Williams (3½ h.p. T.T. Triumph).

PERMIT.—The North-West London M.C.C. has applied for a permit to hold an open trial on December 30th, but as the A.C.U. has at present decided not to grant permits for open reliability trials run by clubs, the request was not granted. We are able to state, however, that this question is engaging the fullest attention of the Union.

NOISY EXHAUSTS.—It has been decided to empower acting judges to disqualify noisy touring machines in open competition.

RECORDS PASSED.—The records gained by S. Wright on a 2½ h.p. twin Humber, described on page 1160 of this issue, have been duly passed.

"The Motor Cycle" Show Numbers.

The *Motor Cycle* series of special show issues will commence next Thursday, and will be as follows:

November 9th. **FORECAST** of new models and designs to be seen at Olympia.

November 16th. **THE BUYERS' GUIDE**, being a complete list of motor cycles on the British market, with a specification of each. Also a continuation of the forecast and guide.

November 23rd. **OLYMPIA SHOW REPORT.** A profusely illustrated description of all new model motor cycles, written by our own staff of experienced motor cyclists after a stand to stand inspection of the exhibits.

Motor Cycle First Aid at Fires.

The Beckenham Council has decided to purchase a motor fire engine. The substation on the Birkbeck estate along with the horsed escape and hand truck are to be discarded, but the useful first-aid N.S.U. tricar is to be retained. The report of the fire brigade committee states that the tricar has showed that it is more effective and can reach the scene of a fire quicker than the hand truck, whilst the firemen arrive in better condition. The tricar is regularly tested and cleaned each morning and is kept in spotless trim. Recently it was called out to help extinguish a motor car and a motor bicycle which caught fire.

MARRIED COUPLES WHO MOTOR CYCLE.

Mr. and Mrs. Simpson, of Leicester, riders of Rudge machines.

SPECIAL FEATURES.

UP PORLOCK AND LYNTON HILLS ON A SIDECAR.

1912 MODELS.

A.C.U. AND PROVINCIAL CLUBS.

Stolen Machines.

A 2½ h.p. three-speed New Hudson was stolen by burglars from the premises of Mr. Frank Dunderdale, 61, Lower Mosley Street, Manchester, on the night of Friday last. The frame number is 877, registration number EN 87. Mr. Dunderdale offers £5 for its recovery.

A 3½ h.p. T.T. roadster Triumph has disappeared from 5-6, Coventry Street, W. It was purloined between the hours of 8 p.m. Saturday and 11.30 Sunday morning, October 21st-22nd. The number on the engine is 13,636 I.E. The machine is the property of Mr. Louis C. Cuffe, 5, Coventry Street, W., who will be glad of information respecting its whereabouts.

Freight Charges and Duties.

In the article published October 12th, page 1078-1079, the duty on motor cycles into Japan was given at 40% *ad valorem*. We find that this is incorrect, as the rate was changed recently, and now is Yen 93.60—about £9 11s. 1d.—for each motor cycle.

Gritting of Metropolitan Streets.

The R.I.A. has issued a memorandum to all street authorities in the Metropolitan area calling attention to a much needed reform in the gritting of streets. The memorandum points out that large grit is of little use as a preventive of slipping until crushed, and recommends the use of ¾ in. grit. Let us hope for the sake of all motorists and cyclists using pneumatic-tyred vehicles that this circular letter will have some effect.

British Success in Italy.

The famous Brescia circuit in Italy was the scene of a conspicuous British victory in the Italian motor cycle club's race for the President's cup held last week. Heavy rain fell and the course, distance about 173 miles, was in terrible condition owing to the chalky nature of the subsoil. Although there were many powerful twins competing, the first two machines home were British single-cylinders, the result being: 1, E. Vailati (3½ h.p. Triumph), 5h. 54m.; 2, C. Pusterla (3½ h.p. Triumph), 6h. 10m.

Accident to a Well-known Rider.

We are pleased to be able to state that Mr. O. C. Godfrey, who, we reported in last week's issue was suffering from a severe accident, is making excellent recovery in the Hampstead Hospital. Mr. Steedman, the driver of the taxi, denies that he was to blame for the accident.

Lightweight Records at Brooklands.

N. D. Slatter, riding an Alcyon light-weight, beat the six hours' Class A record on Tuesday afternoon last, covering 223 miles 1,494 yards. His time for 100 miles was 2h. 21m. 45½s. Other records he captured were:

Two hours ...	84 miles 1,575 yards
Three hours ...	127 " 126 "
Four hours ...	163 " 1,622 "
Five hours ...	196 " 1,011 "
200 miles ...	5h. 5m. 12½s.

A New Motive Power.

We hear, but it sounds too good to be true, that a new motive power has been discovered by a Scotsman which will drive a motor for 5½d. as far as can be done on 5s. worth of petrol. This is said to be derived from the smoke of coal, which, when refined, leaves a pure nitrogen gas; it is non-explosive, but more powerful than steam.

Motor Cyclist's Successful Defence.

Fred Dover, well-known for his ride round the coast on a Premier, was sued for £5 damages at Sheffield on the 13th ult. He was riding slowly uphill and overtook some cyclists pushing their machines and occupying the whole roadway. He sounded his horn and one of them moved slightly to the left, but then he seemed to lose his head and ran to the right, and thus caused the collision. Judgment was given for the defendant, as negligence had not been proved.

Death of a Well-known Rider.

We regret to have to announce that F. C. Wood, at the early age of 23 years, passed away in the Warneford Hospital, Leamington, on Friday afternoon, the 20th ult., after eight weeks' suffering caused by a collision in the night with the gates at Victoria Park, Leamington. At the inquest on Saturday a verdict of "Accidental death" was returned, and he was buried on the following Monday at Leamington. Of a delightfully cheerful nature, he will long be remembered by his numerous friends for his unflinching good nature and manly excellent qualities. Absolutely fearless and a magnificent rider, he got out of many a tight corner which would have brought disaster to anyone else. He rode twice in the Tourist Trophy Race in the 1st of Man, both times on N.S.U. machines. He also competed successfully in the last A.C.U. twenty-four hours' trial to Plymouth and back in 1909, and in a number of other road events. We extend our sympathies to his family, and especially to his father, Mr. W. H. Wood, who accompanied him on many of his rides.

Public Subscription to Purchase a Tricar.

A public subscription has just closed at Beckenham, Kent, in aid of a retired sergeant named Parker of that place, who received rather severe injuries in a motor collision. Over £400 have been subscribed, and it has been decided to purchase an A.C. Sociable with part of the proceeds. Sergeant Parker, who has already made himself familiar with the steering and control of one of these machines, has sufficiently recovered to be able to resume his business duties, and the A.C. should prove of great assistance to him in travelling about.

A Suggestion.

Why not a ladies' day at the Olympia Motor Cycle Show? We commend this suggestion to the show management, who might well set aside a special day for ladies as in the case of the car show.

The "O.T." Club.

A new club has been formed by members of the North-west London M.C.C. called the O.T. club. The members must own machines for which they have paid not more than £7. The name of the club is derived from the words "Old Tank." Hal Hill has joined, and is the proud possessor of an ancient Centaur.

FUTURE EVENTS

Nov. 3-11.—Olympia Motor Show (see "The Autocar").

.. 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

Dec. 9.—M.C.C. Annual Dinner at the Café Monico.

.. 26-27.—M.C.C. Winter Reliability Run to Exeter and back.

.. 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

He is having quite an exciting time wrestling with accumulator ignition, this being his first experience of it. H. J. Pooley, the trials honorary secretary, has a 1½ h.p. Minerva with inclined engine, but as he is a very old-timer, the accumulator ignition does not trouble him. The first event is proposed to be a "race" from Hampstead to Hatfield, "fastest" time to win.

Police Traps.

A trap is being worked in Leeds practically every day. A prosecution for any speed over twenty-two miles an hour means, so we are informed, an inevitable conviction.

Touring Abroad

Owing to great pressure on our space we are obliged to hold over until next week the concluding instalment of the Rev. R. M. Bankes-Jones's article "From the Channel to the Adriatic and Mediterranean and Back by Motor Cycle."

Warwickshire Potholes to be Filled.

We are pleased to hear from a reliable source that the Coventry-Warwick Stratford Road potholes are to be filled up systematically. This may or may not be the result of hints thrown out in these columns, but Midland motorists will be delighted to read the good news.

Four-wheeled Runabouts at Olympia.

The Committee of Management for the Olympia Motor Cycle Show have decided that no vehicle with four wheels and subject to the motor car tax of £2 2s. can be exhibited at the Motor Cycle Show. If four-wheeled runabouts were allowed in the Motor Cycle Show big cars would also have to be admitted, and it is the desire of the promoters not to permit this. It is a matter of regret that four-wheeled runabouts built on motor cycle lines cannot be exhibited this year, as they are so interesting to motor cyclists, but, doubtless, before November, 1912, arrangements will be modified to enable runabouts not exceeding a certain fixed weight—say 6 cwt.—to be placed on view at the motor cycle exhibition.

Valve side of the new two-speed 6 h.p. Enfield-Jap sidecar combination which was described in our last issue, page 1124. It was driven by H. V. Colver in the Midland Inter-club Reliability Trial last Saturday.

THE TRIUMPH TWO-SPEEDER.

The accompanying illustrations are of the new Triumph two-speed gear, which has now undergone several thousand miles testing. From the engine to the counter-shaft drive is by chain, the adjustment being effected by rotating the whole gear casing, the centre of the chain sprocket being eccentric to the centre of the gear casing. It will be noticed that the gear is carried in a tunnel formed on

at a walking pace. One of the gear box shafts can be fitted with a starting handle if desired, enabling the engine to be started with the machine stationary. It is not expected that the two-speed machine will be listed or shown at Olympia. The Triumph Co. have always pinned their faith to the single-gear mount, and their confidence is not by any means shaken yet. We reproduce the illustra-

The toe and heel pedal controlling the new Triumph two-speed counter-shaft gear.

tions as an indication of the trend of design, and to show how neat and workmanlike a counter-shaft gear may be made to appear.

The 3 1/2 h.p. two-speed Triumph, the appearance of which has been anxiously awaited for months. See accompanying description.

the chain stays, which ensures a secure and permanent fixing. Another excellent point is the single lever control. On the footrest is mounted a toe and heel pedal actuating a ratchet-ended rod working a pinion carried inside an extension of the gear box. Pressing the heel portion of the pedal engages the low gear, the mid-way position gives a free engine, and pressing the forward part of the pedal engages the high gear clutch. The clutches are of the expanding type, and the whole of the working parts are self-contained and enclosed inside the gear box housing. To start, the low gear clutch is engaged and the machine pushed along

Showing the short chain drive from engine to counter-shaft, also the large diameter belt pulley. There are a number of detail alterations on the above experimental machine (under test for 1912) which will be apparent to the observant reader.

THE 1912 MOTOSACOCHE ON THE ROAD.

Mr. de Lissa, the manager of the Motosacoché Co., recently placed one of the 1912 models at our disposal for a run down to our Coventry office. Needless to say, as it was a particularly fine day, we were not loth to take advantage of this opportunity to try one of the new lightweight models. Starting from town about 2.30 p.m., we found the free engine device fitted to the Motosacoché a matter of great convenience in traffic; a slight movement of the Bowden-loc lever on the handle-bar slackened the speed of the machine by lowering the jockey pulley, and also brought it to a standstill when necessary without stopping the engine. Restarting was extremely simple with the aid of the same lever. The 5in. Whittle belt took up the drive quite smoothly, and we were soon in the Edgware Road, threading our way in and out of the somewhat congested traffic.

On the way to St. Albans the first hill met with is Brockley, but a full throttle opening and a slight retardation of the spark took the little 2 1/2 h.p. engine up this quite respectable gradient at a good speed. Continuing to St. Albans, the steep incline of Holywell Hill was taken practically without alteration of throttle or spark, which shows the amount of reserve power possessed by this new engine. Once St. Albans was passed, the legal limit of speed could be slightly exceeded, and we found the machine capable of an average of 25 m.p.h. Nothing eventful occurred until Stony Stratford was reached, when unfortunately the temporary phosphor bronze exhaust pipe union came adrift. This was probably due to the fact that we were forcing the engine along as fast as ever we could with a view to finding out a fault if it were possible; future models

will, of course, have malleable iron unions, the phosphor bronze one being fitted for the sake of quickness. However, one of Mr. Negus's mechanics soon inserted a liner in the pipe, and we were quickly on our way again, Coventry being reached about 7.30 p.m. The 2 1/2 h.p. 1912 Motosacoché possesses a fine turn of speed for such a small engine. Since the day we rode the machine it has been fitted with an infinitely variable pulley gear, which is possible in the case of the Motosacoché, owing to the jockey pulley already provided to take up the slackness of the belt when the low gears are in use.

Mr. De Lissa recently showed us one of these variable pulley gears, which is noticeable for its unobtrusiveness; it provides an infinitely variable gear between 5 and 8 1/2 to 1, and with its aid Mr. De Lissa climbed Sunrising on Saturday last without pedal assistance.

1912 MODELS.

Advance Details of New Pattern Motor Cycles.

A new introduction for 1912. $3\frac{1}{2}$ h.p. Premier ladies' model, which will be supplied with a free engine clutch as standard, or three-speed gear as illustrated.

A New $3\frac{1}{2}$ h.p. Ladies' Model Premier.

This is quite a new departure for the Premier Co., but the machine has a neat and pleasing appearance, and as the top tube is low and ample dressguarding is provided, it should prove a very serviceable mount.

A standard $3\frac{1}{2}$ h.p. engine unit is placed vertically in the frame, and is held in position by a forked down tube in front (through which fork the auxiliary exhaust pipe passes) and two substantial engine plates at the rear.

The open frame gives a low riding position, and has a curved top tube, the lower end of which is only 19 in. from the ground. This tube is stayed at the rear end to the chain stay bridge, and above the engine to the front down tube. The combined petrol and oil tank is situated behind the head, while the engine unit is surrounded by a neat metal cover in which a gauze-covered window is

formed directly behind the carburettor intake. The belt is protected both above and below the pulleys, and the top half of the pedalling chain and sprocket is enclosed. Foot-rests are fitted at a comfortable position, and the brake and clutch pedals are brought conveniently near

Premier rear brake mechanism.

to them, the brake pedal being on the left side, and the clutch pedal on the right. Clutch, spring forks, stand, and carrier are all fitted as to the standard $3\frac{1}{2}$ h.p. model, the rear mudguard being detachable behind the back stays. A free engine hnb clutch is fitted as standard, completing a very sound ladies' heavyweight machine.

Kerry-Abingdon.

Thanks to the courtesy of Mr. Llewellyn Jones, we are enabled to give a few preliminary details of the 1912 Kerry-Abingdon motor cycles.

The chief novelty for 1912 will be a 5-6 h.p. twin-cylinder, fitted with side by side mechanically operated valves, bore and stroke 67×95 mm. The engine will have a ball-bearing crankshaft and a special lubrication system. The piston is liberally grooved so that the oil can have access to it, and a duplex priming device is fitted. A dropped frame will be used for this and one of the $3\frac{1}{2}$ h.p. models.

The $3\frac{1}{2}$ h.p. type will have a new engine, and will be sold with clutch or with two-speed gear and clutch, the two-speed gear being the Kerry-Abingdon

type of change speed mechanism, which was described in *The Motor Cycle* this year, but which has been slightly improved in detail. Yet another model will be shown fitted with an Armstrong three-speed gear.

A novelty fitted to all 1912 Kerry machines will be a new kick-up stand, and another innovation shown by the firm will be a plate clutch specially designed for lightweights, the most interesting portion of which is the adjustable pulley. The movable flange has four sets of holes of different depths, which engage with four pins on the outer shell of the clutch, thus giving very easy adjustment without the necessity of using any tool.

New ratchet cut-out on the 1912 pattern $3\frac{1}{2}$ h.p. Rover.

Kynoch—A New Make.

We recently had an opportunity of gathering further details of the new Kynoch models. Either a $3\frac{1}{2}$ h.p. J.A.P. or Precision engine is fitted to a frame on standard lines with a dropped top tube. The new type Bosch magneto is fitted in front of the engine and is controlled from the handle-bar. A B. and L. semi-automatic lubricating pump is used, and a variable jet B. and B. carburettor will be standard. Druid spring forks are employed, and half the rear mudguard is detachable to facilitate tyre repair. Both these models can be supplied with the B.S.A. two-speed gear.

An entirely new model—the $3\frac{1}{2}$ h.p. single geared Kynoch.

1912 Models.—

1912 Douglas power unit showing the inclined mechanically-operated valves, adjustable tappets, accessible sparking plugs, and single silencer. (See our last issue, page 1129).

A Detachable Terminal.

The Efandem Co., 246a, Corporation Street, Birmingham, have placed on the market a simple and effective terminal which is highly suitable for motor cycle work. From the illustration it will be seen that the terminal is stamped out of one piece of metal. At one end there is a hole through which the central wire of the sparking plug passes. The other end is slotted, and through it projects a

The Efandem terminal.

hook stamped out of the metal strip of which the terminal is made. To attach the terminal it is only necessary to press down the end and slip the wire through

The new Bosch two-spark magneto, showing armature partially withdrawn.

the hook when the end springs up and locks it against the hook. It is impossible for the connection to shake loose.

The Efandem Co. have also introduced a well-made motor cycle lamp, which was exhibited at the recent Olympia Electrical Exhibition. It appears to give an exceedingly good light. It is mounted on a strong bracket and is capable of being tilted at any angle, while the bulb can be focussed to suit the rider's requirements. The Efandem Co. recommend their own unspillable accumulator to be used in conjunction with this lamp. It is fitted with Tec terminals.

The Bosch Two-spark Magneto.

Some correspondence recently appeared on the "Question and Replies" pages respecting the use of two plugs in one cylinder. The Bosch Magneto Company has now given us the opportunity of publishing a description of the Bosch two-spark motor cycle magneto, which has been introduced to give two simultaneous sparks at two ordinary plugs. This device will be shown at the coming Olympia Show.

The instrument is larger than that usually fitted to a motor cycle. The illustration shows the armature withdrawn about half an inch from the pole pieces. This armature is not of the normal type, and it will be seen on referring to the drawing that, instead of one end of the secondary winding being earthed, both ends are brought indepen-

dently to two segments in the slip ring. These two segments, which are 180° apart, come in contact simultaneously with the two carbon brushes which carry the current to the plugs, and conse-

The Bosch magneto switch.

quently two sparks occur at the moment when the points of the contact breaker open.

The high-tension switch which is also illustrated is designed to fit on to the top tube of a motor bicycle. With this high-tension switch, when the lever is upright both plugs are working simultaneously; when it is moved to the left or right one or other of the plugs is cut out, and the magneto gives a single spark only.

C.C.R.-J.A.P.

The other day one of the partners of the firm of Smith Bros., Nottingham, called upon us with the luxurious sidecar which we illustrate, with the object of giving us a short spin. We found the sidecar most comfortable riding, the double C springs forming an ideal suspension. The 6 h.p. side by side valve J.A.P. is most effectively silenced, and the machine purred along on its top gear at well up to legal limit with an entire absence of vibration. The sidecar hood and screen are standard fittings on the C.C.R.

6 h.p. C.C.R.-J.A.P. three-speed sidecar combination

Another new make of motor cycle—the 2½ h.p. three-speed Hazlewood-Jap.

Hazlewood.

A new make of motor cycle for 1912 is the Hazlewood. It is a 2½ h.p. medium weight. A J.A.P. engine with side by side valves is employed in conjunction with the Armstrong three-speed hub, giving gears of 5, 7, and 10 to 1. A dropped top tube, substantial stand and carrier, Druid spring forks, and eccentric bottom bracket are standard fittings. Brakes and mudguarding have received special attention, and this machine should help to meet the increasing demand for a light machine which will go anywhere. We hear that Hazlewoods, Ltd., are one of a few firms who have between them booked up all next year's output of the well-known Armstrong gear.

Showing screw adjustment of the foot-brake on the new Calcott described in our last issue.

Alldays Improvements.

Since we last described the Alldays motor cycle several improvements have been made, with the object of producing a more handy and comfortable machine. A domed top piston is now used, and slippers have been interposed between the cams and tappets. Narrower piston rings are fitted, as it was found that the wide ones used previously had a tendency to bind in the cylinder. In all other respects the engine remains the same. It will be remembered that the Alldays machines are fitted with aluminium footboards. In future these will be sprung from the front end instead of the back, as it is found that this gives a more comfortable riding position. The new frame has a dropped top tube, improved handle-bars, and carrier, while both single and two-speed types now have a kick-up stand. Cleanliness has been carefully studied. The combination of footboards, efficient mudguards, and an aluminium trouser guard covering the valve mechanism, should keep the rider reasonably clean.

The Roc hub two-speed gear is employed, and customers have the choice of B. and B. or Amac carburetters, and Bosch or E.I.C. magnetos. Best and Lloyd semi-automatic lubrication is fitted as standard.

Rudge.

A small point, illustrative of Rudge thoroughness, is found in the manner in which spare valves are protected by neat metal shields as shown in the accompanying sketch. Not only is the working face of the valve completely prevented from suffering damage by being put loosely into the tool bag with other hard objects, but the spring and cotter are also kept in position by a small tubular distance piece which also protects the valve stem from injury. The drawing shows the idea as applied to the inlet, that for the exhaust valve being similar, but, of course, larger.

The Rudge spare valve protector.

The Two-stroke Levis.

This interesting little machine is propelled by a three port two-cycle engine, and has been slightly redesigned for 1912. The new piston is designed with a partially domed head, giving a sharp uprush to the inlet gases, and a very clean sweep for the exhaust. There are only three moving parts—the piston, connecting rod, and crankshaft. The crankshaft is a solid forging, carefully hardened and ground, the big end bearing being split. The lubrication is interesting, as the usual form of splash is not relied on. Oil is led to the piston through the cylinder wall, and thence *via* holes in the hollow gudgeon pin to the small end bearing. Another pipe is led to the main crank-

The 1912 Levis two-stroke engine.

A. Inlet pipe. B. Transfer passage.
C. Compression release valve.

shaft bearing, which has a retaining groove cut near the outer end. From this groove the oil is led through a hole in the crankshaft into the shaft itself, which is drilled for the purpose, thence by centrifugal force to the big end, the

Next year's model 3½ h.p. two-speed Alldays. Note the covered-in valves.

1912 Models.—

excess oil from the cylinder being led through a duct to the other crank bearing. A Bosch magneto is fitted in front of the engine and driven through an enclosed chain. The carburetter can be

The compression release valve on the Levis light-weight.

either B. and B. or Amac at option. An outside flywheel with the weight well in the rim is employed. An improved compression release valve is fitted in the head. We had a run on one of the smaller types, and although the particular machine is only

Levis piston showing position of rings and deflector.

device. The weight of the 2½ h.p. complete is 85 lbs., the 2½ h.p. 93 lbs., and the 2½ h.p. T.T. 90 lbs.

Puch.

We have already referred to the new arrival in this country—the Austrian Puch. The machine has been amended in design to conform to English ideas, and at the Show will have B. and B. carburetter, footrests, pedal-applied foot brakes, Bowden operated hand brakes, and a lower saddle position.

His Highness Prince Alexander Lubomirski is an enthusiastic owner of a 6-7 h.p. twin Puch and sidecar.

The Tourist Trophy Quadrant. This machine differs from the standard mount in that it has a shorter wheelbase, and special cams and valve setting.

Rex.

The Rex Motor Mfg. Co. will market the following models in 1912: 3½ h.p. Speed King or Tourist; 6 h.p. twin Speed King or Tourist; 4 h.p. Tourist single

cylinder, air or water-cooled; 4 h.p. De Luxe, single cylinder, air or water-cooled; 6 h.p. De Luxe twin-cylinder; 4 h.p. Sidette De Luxe, air or water-cooled;

The spring fork of the Puch.

1912 Douglas lubrication system. There is a glass barrel on the tank showing rate of feed of the engine oil.

6 h.p. twin Sidette De Luxe. The 4 h.p. is a new model introduced for next year's market, and has a larger bore than the 1911 3½ h.p. of 499 c.c. capacity. It will be dealt with in detail in our Show issues.

Two Puch single-cylinder mounts.

(1) The 2 h.p. 68×70 mm. model.

(2) The 3½ h.p. 76×100 mm. machine with spring frame

1912 Models.—

N.S.U.

The most radical alterations in the N.S.U. designs will be found in the $3\frac{1}{2}$ h.p. engine, 85 by 88 mm., 499 c.c. The prototype of this engine was first seen in England at the Tourist Trophy Race. The magneto is placed behind the cylinder, is of the latest Bosch enclosed type, and is gear driven. On the gear wheel nearest the engine-shaft is a cam operating the exhaust valve, and on the next

gear wheel to it is that working the overhead inlet valve. Both tappets are adjustable, but the exhaust valve has an adjuster on the valve itself; this consists of a foot screwed on to the bottom of the valve stem and secured by a lock nut. To adjust it two spanners are used. If the adjuster be unscrewed the foot is forced against the tappet and lifts up the valve stem, thus enabling the valve to be easily extracted. To replace the valve it is only necessary to hold the adjuster

in position, to insert a screwdriver in the valve head, and force the valve down against the spring on to the adjuster. This is a process which is far simpler and easier than compressing the spring and inserting a cotter pin through the slot in the valve stem.

The latest type of N.S.U. automatic single lever carburettor will be fitted. Riders, so Mr. Schink, the manager of the company, informs us, are not quite used to controlling this carburettor, since they try and use it as an ordinary non-automatic carburettor by throwing the throttle full open. Like all carburettors of this type, the throttle cannot be fully opened until a high speed is attained,

and when the lever passes a position over 45° from the handle-bar any further opening means a weaker mixture, which will not give increased speed unless the engine is turning over at a large number of revolutions.

The engine pulley is fitted with an oil-retaining ring, any waste oil being carried away through a drain pipe. The $3\frac{1}{2}$ h.p. model will be fitted with a drop frame.

For 1912 the N.S.U. spring fork has been simplified and made more efficient, and in every model the rear portion of the frame will be sprung.

On the 3 h.p. twin the under-gear pulley is adjustable. The 6 h.p. twin, 75 by 90 mm., 796 c.c., is built up on the same lines as the 3 h.p., but the engine is now placed vertically in the frame, and not with the rear cylinder vertical, as was the case in former models. For this machine a new two-speed gear has been designed on the same lines as the smaller gear, but it is larger and stronger, and improved in detail. In this and the smaller two-speed gear the pulley flanges are adjustable, which is a decided improvement. Both flanges may be moved at will, but the inner flange need only be altered in cases of emergency. The outer flange is secured by a locking ring, and between it and the movable flange is a loose ring which has a projection in it engaging in a slot, the object of which is to allow the adjusting ring to be turned without revolving the movable flange. As soon as the correct adjustment is obtained it is not necessary to secure the locking ring, as the pressure of the belt is sufficient for this purpose. The gear is also fitted with a large metal cone clutch provided with oil grooves and three extra plates for the engagement of the low gear. The planet wheels are carried in a cage and are supported at both ends, and an oil-retaining ring is provided. The 3 h.p. twin, 58 by 75 mm., and the 2 h.p. single cylinder machine, will be the same as last year's models, except for the improvements above referred to in the spring fork design, which is common to all models.

A New Sidecar Stand.

M. J. Varley, 57, Stoney Lane, Sparkbrook, Birmingham, has sent us particulars of a sidecar stand which we illustrate. The stand is clipped to the sidecar axle and is put into operation by placing one

Varley's sidecar stand.

foot against the leg of the stand at the same time pulling the sidecar back. It will be noticed on reference to the illustration that the top of the stand is provided with a spring and plunger. When the sidecar is supported by the leg it inclines at an angle of seven degrees, thus making a support, and when out of use the spring prevents any possible chance of the leg falling. It will be exhibited on the Calthorpe stand at Olympia, as will the Forward sidecar which will be fitted with a canopy hood, luggage carrier, tyre carrier, petrol carrier, and refinements in the way of toolboxes, etc.

Another Two-speed Hub Gear.

The broad principle claimed for the Thornton two-speed hub is that a free

The Thornton two-speed hub gear showing the parts dismantled.

engine can be obtained without disturbing the mechanism which operates the high or low gear. The clutch consists of a phosphor bronze ring D which is split and engages the hub shell H by means of cone E, pinion carrier C and lever F2 working on spiral F1. The normal ratio is obtained by locking gear wheel B to the belt hub K through the intermediary of clutch D and pinion carrier C, the gear wheel B being locked to the carrier by four pegs or keys. The low gear position is arrived at by sliding B along the shaft until it engages with pegs or keys

A complete hub with Thornton gear.

L. the reduction in gear being effected through pinions J. On the underside of G is attached the free engine mechanism. This consists of teeth cut on plate G engaging with corresponding indentations on D and C; when the clutch ring is contracted the engine can be pedalled with rear wheel resting on the ground with either high or low gear engaged. The makers, W. J. Glover and Co., 32 King Street, Leicester, claim that the gear is absolutely proof against damage through bad handling.

CLUB NEWS.

A New Club for Blackpool.

A meeting of motor cyclists was held at Blackpool on October 26th, under the chairmanship of Mr. T. Sharples, when it was decided to form a Blackpool motor cycle club. A further meeting for the adoption of rules and election of officers will probably be held this week.

Mersey M.C.

This club held a flexibility hill-climb on the 29th ult., the prizes being awarded for the greatest difference between a fast and slow ascent. It was intended to run this event, the last of the season, on Cilcain Hill, but the police appeared on the scene and prevented it. Accordingly the intending competitors had to start off in a drizzling rain and search for another hill. The winner proved to be Noel Brown (Rudge); second, Jack Fox (Triumph); third, V. E. Horsman (Bradbury). After this event the postponed hill-climb of July 23rd was run, with the following result—Singles: 1, V. E. Horsman (Bradbury); 2, F. C. Jones (Bradbury). Fastest time of the day: Horsman (Bradbury). The sidecar class was abandoned, as the machines used by the competitors failed to climb the hill.

Harrogate and District M.C.C.

On Thursday evening, October 26th, a breakdown competition was held. There was a good gathering of members, but only ten endeavoured to find the faults, which were the high-tension brush not touching the slip ring, and the throttle slide of the carburettor having slipped off the wire. The competitors were first regaled with light refreshments, and were then allowed seven minutes in which to put the machine in running order. Only four succeeded in the time fixed, and they were: B. Tindall (winner Bosch plug), 1m. 31s.; H. W. Fortune (winner tyre levers), 2m. 9s.; W. E. Grange, 3m. 1s.; W. B. Atkinson, 6m. 28s. T. C. Atkinson kindly presented the prizes and set the task to be done, his assistant being H. Ballance. The machine used was a 1906 Triumph.

To-day (Thursday, November 2nd), the annual general meeting is to be held at headquarters.

Start of the Chesterfield Club's Reliability Trial from the club's headquarters. The winner of the passenger class, J. Haslam (6 h.p. Zenith), with F. Dover in the sidecar, are seen in the centre of the group.

Sheffield and Hallamshire M.C.C.

The annual dinner and prize distribution will be held at Davy's Victoria Café, Fargate, on Thursday next, the 9th inst. The dinner will be followed by a dance.

Derby and District M.C.C.

The committee have made arrangements for the annual dinner to be held at headquarters, St. James's Hotel, on Wednesday, December 13th, at 7.30 p.m. The dinner will be followed by a smoking concert and presentation of prizes. Tickets, 3s. 6d. each, may be obtained from the hon. secretary, A. B. Bennett, 13, Wilson Street Derby.

ON SUNRISING IN SATURDAY'S MIDLAND INTER-CLUB RELIABILITY TRIAL.

R. H. Edwards (Triumph) who made a non-stop run but was six minutes too early at the secret check.

Club News.—

Members of the M.C.C. who took part in the closing run to the Bridgwater Arms, Little Gaddesdon.

Westmorland M.C.C.

The annual dinner and prize distribution, followed by a concert, will be held on Thursday, November 9th, at the Commercial Hotel, Kendal, at 8 p.m. The prizes will be distributed by Mr. H. Goodwin, jun., of Orton Hall.

Sutton Coldfield A.C.

This club has given notice of its desire to sever its connection with the Auto Cycle Union on December 31st. It has been thought advisable to take this step as a matter of form, and it does not necessarily follow that the club will not re-affiliate next year.

Leicester and District M.C.C.

Result of reliability trial for the Edwards Cup, third round, held on October 19th: 1, E. Folwell ($3\frac{1}{2}$ h.p. Bradbury); 2, E. Goodin ($3\frac{1}{2}$ h.p. Bradbury); 3, C. Bailey ($3\frac{1}{2}$ h.p. Rudge).

Coming Events. November 3rd.—General meeting at headquarters, 8.30 p.m. December 7th.—Fourth and final round for the Edwards Cup, 2.30 p.m. December 15th.—Annual dinner and prize distribution at headquarters, 7 p.m.

North Middlesex M.C.C.

A whist drive will be held about the middle of November, followed by lectures, discussions, etc., on the use and construction of the motor cycle. The club is making up a party for a special visit to the Show, and all who intend joining should communicate immediately with the hon. sec., Mr. D. G. Blakey. Mr. A. Deacock will afterwards read a paper entitled "Impressions of the Show."

Cornwall M.C.C.

Extremely bad weather rather diminished the number of starters in the eighty miles reliability non-stop run held on the 14th ult., and also made the road very greasy and the hills difficult to negotiate. The run had to be completed at 20 m.p.h., there being one known and three secret controls. In spite of the adverse conditions, there were only three failures all on single geared machines, whilst the best performance, for which a gold medal was specially given by the club, was that of Meek ($3\frac{1}{2}$ h.p. Triumph and sidecar), who covered the whole distance without a single stop or even dropping his passenger, and arrived home exactly on time. The results on time were: 1, W. Tressider ($3\frac{1}{2}$ Triumph); 2, Simms ($3\frac{1}{2}$ Triumph); 3, G. S. Collings ($2\frac{3}{4}$ Enfield).

Bristol B. and M.C.

A non-stop speed-judging competition, open only to those members who had never won a first prize in a motor event, was the club's last trial of the year on Saturday, 21st ult. The course was a secret one of twelve miles, to be covered three times at 20 m.p.h. Out of an entry of fourteen, only four competitors made non-stops, the very greasy state of the hill leading out of Over Lane on to the steepest part of Black Horse Hill (near Westbury) causing many falls through side-slips. The following was the result:

1, B. Adams ($2\frac{1}{2}$ A.J.S.), total error 3m. 52s.; 2, P. F. Davies ($3\frac{1}{2}$ Rudge), total error 11m. 17s.; 3, F. C. Wasley ($2\frac{3}{4}$ Douglas), total error 15m. 11s.

The late Hon. Sec. of the M.C.C.

As already announced in these columns, Mr. Arthur Candler has been compelled to resign the M.C.C. secretaryship owing to very great pressure of business. He has held the post for nearly eight years, and to him the club owes the inception of the London to Edinburgh Run, which has done so much to popularise the M.C.C. When Mr. Candler joined the membership numbered 100, now it is nearly 400. Recognition of his valuable services is to be made, and it has occurred to the committee that past members who would like to be associated in this laudable object, should communicate with the hon. treasurer of the fund, Mr. F. J. Jenkins, 35 Loveday Road, Ealing, W. Individual subscriptions are limited to 5s., and the list closes on the 18th inst.

Miss C. C. Page of Enfield, on her $3\frac{1}{2}$ h.p. two-speed Hummer and sidecar. Miss Page took to sidecar driving last May, and is now capable of driving the machine anywhere. She frequently covers fifty miles without the least fatigue and thinks it fine sport.

HUMBER ACTIVITY AT BROOKLANDS.

Fifty Miles, Hundred Miles, One Hour, and Two Hour Class B Records Broken.

S. Wright and P. J. Evans mounted on 2½ h.p. twin-cylinder Humbers at the start of the successful attempt on record.

ON Wednesday afternoon last week, Sam Wright, the Humber veteran, and P. J. Evans, the Junior Tourist Trophy winner, both under the parental protection of Bert Yates, another Humber veteran record breaker, set out to lower all the Class B record times they could in the space of two hours. Wright rode the 2¾ 60 by 60 mm. 340 c.c. twin which had competed both in the T.T. and the Six Days' Trials; Evans was similarly mounted, but on a newer machine.

At the end of two hours in which time 109 miles 980 yards were covered. Standing beside Wright are B. Yates and the brothers Bashall.

been doing so well his machine, owing to misfiring, slowed down at the thirty-sixth lap to 3m. 24s. per lap. At the fortieth lap he had to stop and replace a plug, and when this was done he found he had only sufficient time left to cover one lap. The record, however, was his, as in the two hours he covered 109 miles 980 yards. Previous best, 95 miles 1,230 yards, by H. J. Cox (2¾ h.p. Forward, 56.75 by 68 mm., 344 c.c., September 11th, 1911). Wright's time for the 100 miles was 1h. 45m. 31¼s., that of Cox 2h. 5m. 37¼s.

This performance is interesting, as it is the first record attained under the new Brooklands silencer regulations. Wright's machine had a standard T.T. exhaust pipe extending to the rear of the machine, with the end of the pipe flattened and holes bored ¼in. from the extremity.

S. Wright stops to have a plug changed.

TWO NOVEL THREE-WHEELERS.

A "WELL-TIMED" A.C.

THE accompanying illustration shows an A.C. passenger carrier that is attracting a good deal of attention in South London. It is owned by a firm of clock makers and repairers, and in front and on each side is fitted a large clock with circular dial—each clock being set to Greenwich time.

The body has been adapted to carry a passenger on a seat at the right-hand side, and a clock repairer and winder, as seen in the photograph, invariably travels with the machine. In addition to the three clocks, others which have received repair are carried in the delivery box insulated by means of soft matting.

The illuminated glass signs on each side that also serve as side lamps are another novelty. Both are lit by twin burners, and a car-sized head lamp is fitted, the whole being supplied by a large generator of six hours capacity.

An A.C. owned by a firm of clock makers.

Although this must be one of the heaviest loaded A.C.'s in use, it is quite satisfactory, and the air-cooled engine performs its work in first-rate style. In course of business, the machine runs about fifty miles daily.

So far the clocks have not been affected by the vibration.

With a chronometer or two fitted it would be a useful machine at trials and competitions, especially with the travelling expert.

A HOME-MADE SOCIABLE.

THE novel three-wheeled runabout illustrated herewith has been built and designed by Mr. Calvert, of Swandon, near Hull, with the assistance of a local engineer. The seats are arranged sociable fashion, the body being called a torpedo pattern. The engine, which is a twin-cylinder 6 h.p. Sarolea, transmits the power *via* a two-speed gear box, and we are told that the machine will attain a speed of 30 m.p.h. on the road, and that its consumption is

A locally-built twin-cylinder sociable, with tiller steering, some details of which are given in a paragraph on this page.

fifty miles to the gallon. The petrol tank will be noticed at the rear of the seats. There is no tendency for this three-wheeled machine to overturn at corners, we are assured by the owner, and the tiller steering answers all requirements.

A DETACHABLE FRONT WHEEL MUDGUARD.

WITH the advent of autumn, the mud problem again demands attention. We have received from Mr. W. F. S. Harding, of Frensham, Farnham, Surrey, a sample of his front wheel cover shield, which may be attached or detached in a few minutes. When not in use, the cover may be folded up into a small space to occupy a corner of the toolbag. It only weighs three ounces. The method of securing the cover is by eyelet holes and a leather lace. At the extreme lower end of the mudguard a small stud is fitted, which passes through an eyelet in the shield, thus securing the cover at this point.

A detachable front wheel covering for use on muddy roads. Inset the cover folded up and laid on the saddle.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

No Power on Hills.

? I have a $3\frac{1}{2}$ h.p. 1905 Rex with accumulator ignition and cannot get power. It fairly lies on level, but when it comes to a hill it won't go at all. The compression is excellent. Do you think a larger jet would be an advantage?—W.E.S.

You might try a larger jet with advantage, and also try a slightly lower gear.

Magneto Point Burning.

? Will you kindly suggest a possible cause and remedy for the platinum point on the bell crank lever of contact breaker on Bosch magneto burning out after about 1,000 miles running? The fibre on the lever doesn't bear on the steel segment the full arc, therefore the points close before the full distance of segment is traversed. Would this have any effect on them? Point on contact piece is still good, whilst two on the breaker have burned out.—W.R.C.

The trouble is due to a bad electrical connection to the condenser, that is, the steel strip leading from the condenser to the central contact screw inside the contact breaker case. See that these points are clean, and that a firm contact is made.

$3\frac{1}{2}$ h.p. or 5 h.p. for Sidecar.

? I have a 1911 f.e. Rudge which I use with a Herald rigid wheel sidecar. The combined weight of passenger and myself is twenty-one stones. I have the offer of a 5 h.p. f.e. twin Indian in exchange for my Rudge with a few pounds cash adjustment. Do you consider it advisable for me to accept this offer, taking into account (1) that I intend to keep whichever machine I decide on for several years. (2) Keeping two cylinders in order against one. (3) Chain drive compared with belt drive. (4) More expense in petrol, tyres, etc. (5) Would engine and frame of twin withstand the strain of sidecar work better? (6) Would it be necessary to change sidecar wheel to 28in. to match bicycle wheel. I should be glad if you could also tell me if you think a Jones three guinea speedometer would be a satisfactory investment, and if the three guinea variety can be reset after 10,000 miles.—W.C.A.

(1-2) There is no doubt that for sidecar work the larger twin-cylinder machine is

the better. Of course, it takes slightly more keeping in order than a single. (3) We prefer chain drive for passenger work. (4) On the other hand, there is slightly more expense as regards petrol and tyres. (5) The frame should be quite satisfactory. (6) It will not be necessary to change the sidecar wheel to 28in. We have no hesitation in recommending the speedometer mentioned, it is quite good. The speedometer in question resets itself automatically after 10,000 miles.

Respecting a Sidecar.

? I desire to get a passenger machine, but a perusal of your columns has not cleared away my doubts about what to get. The main consideration is economy of running, but the machine would be required to negotiate main road hills (e.g., between Manchester and Sheffield) with sidecar, and not more than 20 stones up. (1) I have a fancy for a N.S.U. $3\frac{1}{4}$ h.p., with two speeds and clutch. Do you consider this would be a suitable investment and meet my re-

quirements? As the undertaking is in the nature of an experiment (my intended passenger being excessively nervous), I don't want to lay down more than £30 or £35 at first. (2) Should you recommend a competition-used but otherwise new N.S.U., or advise a privately-owned second-hand? (3) What mileage could I expect to the gallon? (4) Would a twin-cylinder greatly increase running costs? (5) Would attaching and detaching the sidecar with every run, for storage, be liable to injure couplings, or should they be disturbed as rarely as possible?—J.W.

(1) The machine about which you enquire would suit your purpose admirably. (2) We should recommend the machine which has been slightly used, if it is for sale by the N.S.U. Company, as it would be overhauled before being sent out. (3) Between seventy and eighty miles to the gallon. (4) No, the increase in the cost of running would not be very great—say 15%. (5) No, with a modern sidecar, attaching and detaching does no harm, the couplings are too strong for that.

A FRENCH MOUNTAIN CLIMB.

Gabriel (T.T. Triumph) second in Class III, for 500 c.c. machines in the Mont Verdun (Lyons M.C.C.) hill-climb. His time was 4m. 0½s., that of the winner Escoffier (Magnat-Debon) 3m. 33½s.

Forced Induction.

?

I have a 1911 $3\frac{1}{2}$ h.p. Premier, fixed engine. I should be obliged if you would tell me if it is advisable to fit an extra air inlet pipe? What does this pipe actually do practically and theoretically? What should it be like, i.e., straight to the rear, or what? I must add that I have had no trouble with my machine, and only desire to add to its efficiency if possible.—O.H.S.

We should hardly think it would be worth while fitting an extra inlet pipe for ordinary touring purposes. The pipe in question should be about 4in. long, extending directly behind the carburetter. This is said to induce an extra flow of air, which carries with it an increased quantity of spirit, thus producing a slight increase of power and greater economy. The theoretical effect is that of forced induction.

Newark to Hastings and Brighton.

?

Can you tell me the best way from Newark to Hastings? (1.) To miss London. (2.) To go through a part of London. Also from Newark to Brighton.—J.A.C.

To go through London your best route would be as follows: Newark, Grant-ham, Stamford, Stilton, Eaton Socon, Biggleswade, Baldock, Stevenage, Hatfield, North Barnet, Regent's Park, London, cross Westminster Bridge, and after passing the railway bridge keep to the left. This will bring you eventually to Old Kent Road, which follow through Lewisham and Bromley. Continue through Sevenoaks, Tonbridge, Lambethurst, Robertsbridge, Battle, to Hastings. It would be infinitely preferable, however, to miss London altogether and to leave the Great North Road after Stamford, going through Hertford, Ware, Harlow, Chipping Ongar, Brentwood, Tilbury, by ferry to Gravesend, and go through Meopham, Wrotham, Tonbridge, where you join the Hastings Road. To reach Brighton from Newark follow the Great North Road to Hatfield, and then go through St. Albans, Watford, Rickmansworth, Denham, Uxbridge, Colnbrook, Staines, Chertsey, Woking, Guildford, Cranleigh, Horsham, Cowfold, Henfield, Piecombe, Brighton.

Sidecar and Speedometer Wanted.

?

As a constant reader of your valuable paper may I ask you a few queries? (1.) Will a sidecar with 26in. wheel fit an Indian twin which has 28in. wheels, or should I have to get a 28in. wheel fitted (most or all sidecars advertised have 26in. wheels)? (2.) When ordering a speedometer for an Indian cycle, must I specify for a 28in. wheel, or does it suit both 26in. and 28in.? (3.) Can a free engine clutch be fitted to a 5 h.p. fixed engine Indian, and about what is the cost? (4.) On what part of an Indian engine must one look for the date of manufacture? (5.) Where can I get a long registration number?—TROUBLESOME.

(1.) A 26in. wheel sidecar would fit. To 1911 models a 28in. wheel sidecar cannot be fitted. (2.) You must order the speedometer for a 28in. wheel. (3.) A free engine clutch could be fitted at a cost of

£4 10s. plus 10s. extra for the cost of fitting. (4.) The engine number is on the crank case. If you let the Hendee Mfg. Co. have this number they will tell you the date of manufacture. (5.) We should advise you to apply to the London County Council, Spring Gardens, S.W. (Motor Car Registration Department).

Two or Four-stroke?

?

I am getting either a P. and M. or Scott 1912 machine. Can you tell me which would be the most valuable after, say, five years, used carefully of course?

Could you tell me which would be likely to be the most lasting machine in wear? There seems to be nothing to get out of order on a Scott which a person of average mechanical intelligence could not attend to. I do not mind the extra petrol and oil consumption, provided it has the equivalent extra efficiency over the P. and M. It would be used mostly solo—sidecar work only occasionally. I know the P. and M. to be good, as I have one. But I have an inclination for a Scott owing to the various good ideas incorporated in it, but would like some information as to the wearing qualities of the engine, and how frequently the engine requires overhauling. Is the frame quite safe for sidecar work?—R.H.B.

It is impossible to say which will be the most valuable machine at the end of five years, as one does not know what improvements either of the two firms will bring out. We do not think there will be any difference with either as regards wear; both are first-class makes. We do not think you would find the two-stroke engine to be superior to the other as regards efficiency, but as regards even turning effort it is necessarily superior. There is no reason whatever why the engine should not wear extremely well. The frame is entirely satisfactory for sidecar work.

Knocking after being Rebushed.

?

Can you give me any information on the following? 1908 $3\frac{1}{2}$ h.p. just rebushed, new piston rings and gudgeon pin. Since this has been done the engine continually knocks. It never did so before. The magneto has been so timed that the engine can be made to roar, and also nearly to stop. When travelling I can retard until it will no longer pull, and it still knocks. If advanced it will knock louder. The piston is a good fit. Since the renewal of these parts the machine has run about 200 miles. It knocked from the first and is still doing so.—C.R.H.

We should say that the piston ring and gudgeon pin are rather too tight a fit in the engine. What we should recommend you to do is to take the machine to the works and let the manufacturers examine it.

EXPERIENCES WANTED.

"C.N." (Harrow). A.S.L. 1910 or 1911 model; reliability of air springs.
 "G.W." (Surrey). Rex 5 and 7 h.p. engines with overhead inlet valves.
 "R.O." (Chippenham). $2\frac{3}{4}$ h.p. Douglas and $2\frac{3}{4}$ h.p. Enfield.
 "H.C.W." (Chalfont St. Peter). $2\frac{1}{2}$ h.p. F.N. and $2\frac{3}{4}$ h.p. Moto-Rève.
 "A.M.S." (Cheltenham). $2\frac{1}{2}$ h.p. two-speed A.J.S.
 "G.H." (Torquay). 4 h.p. Scott.
 "W.B.D." (Derby). Four - cylinder F.N., two-speed gear model.
 "A.H.L." (Ramsgate). Douglas or Enfield lightweight.
 "H.A.C." (Cambridge). $2\frac{3}{4}$ Enfield.
 "R.L." (Anerley). $4\frac{1}{2}$ h.p. Precision and 4-5 h.p. Norton.
 "Camlin" (Croxeth). 7 h.p. T.A.C.
 "R.D." (Whyteleafe). $3\frac{1}{2}$ h.p. Rudge, fixed and free engine models, particularly with regard to adjustable pulley.
 "J.A.D." (Woodford). Clutch and free engine for a twin Bat.

NEW SOUTH WALES SIDECARISTS.

Left—Mr. and Mrs. J. Elliott; right, Mr. and Mrs. E. Cooper of Sydney, whose mounts are respectively a locally-built 5 h.p. Elliott-Jap, and a $3\frac{1}{2}$ h.p. L.M.C.

ELECTRICAL TIMING.

K NOWING that readers of *The Motor Cycle* are interested in the above subject, I give a short description of an apparatus which has been devised for the Canterbury and District M.C.C., specially for such events as hill-climbing, short speed trials against the clock, etc.

In the first place, I must acknowledge my indebtedness to the designer of a similar apparatus which won *The Motor Cycle* prize. (See page 666, issue of June 29th.)

Referring to the photographs, the interrupter and telephone A are fixed at the starting point, while the recorder C and second interrupter B are at the finish.

The communication wires are led up the side of the hill by means of a large drum mounted on a road wheel which is fitted with a simple automatic re-winding gear. The ends of the wires are connected to the terminals 1, 2, on A, and at the finish to the terminals 3 on C.

As it is not always convenient to have the recording apparatus set up exactly at the finishing point, provision is made for connecting the interrupter B to the recorder by means of a short length of flexible wire from the terminals 4 on B to those marked 5 on C.

It should be noted that the communication wires up the hill are not used in recording the finish; consequently, as will be shown later, full telephonic communication is available at all times except during the actual starting moment.

The apparatus A is used at the start and B at the finish.

The starting and finishing lines are cotton threads stretched lightly across the road and fixed at one end to a suitable post, while the other ends are hooked over levers 6, just visible on both A and B. The lever 6, when pushed against the disc 7, engages with

a small stop pin on the face of the disc, the latter being caused partially to rotate under the action of a weight in the cylinder 19, acting on the periphery of 7 by means of a fine cord. On touching the cotton, lever 6 clears the stop pin and the disc rotates partially, causing the crank-driven plunger 8 to dip into and withdraw from the mercury in cup 9, thus making and breaking the recording contact. During transport, a small cork inserted into the mouth of the mercury cup prevents spilling.

To obtain a definite duration of contact, the weight is made in the form of a light piston nearly fitting the cylinder 19 and forming an air dashpot of slight retarding effect. Contact is established immediately, but the fall of the piston is somewhat checked as it nears the end of its stroke.

The recorder containing the watch.

The Method of Working.

Coming now to the action of the recording apparatus, the necessary dry cells (four in number) are carried in case C, and suitably connected up permanently. The feeble current received from A through the relatively high resistance of the line wires actuates a magnetic relay 10 on C, which closes the circuit of the main electro-magnet 11 and starts the watch 13 through the brass plunger 12. On release of contact this plunger is returned by a spring shown in the photograph. The interrupter at the finish connects direct to 11 without the use of the relay, and thus the watch is stopped at the finish in a similar manner to that in which it is started. The time being observed, the watch is returned to zero by touching the button 14.

Telephonic communication is established by means of the change-over switch 15 seen on A and C. In actual practice these switches are both kept on "telephone" until a competitor is ready to start; the operator at the start then warns the one at the finish and both switches are reversed. The competitor having crossed the starting line (which is known at the finish by the watch having started), both switches are again placed on "telephone" and kept there until the next competitor is ready.

I found the apparatus to work very satisfactorily at its first trial, and a number of events were run off in very short time, results being recorded to one-tenth of a second with ease. The watch has a thirty seconds dial, consequently readings are made more easily than when the usual sixty seconds dial is employed.

H.A.D.

HOW TO BUY AND SELL MOTOR CYCLES.

It is an almost impossible thing to sell a motor cycle for cash to-day. We are now speaking from experience. We have sold over 1,000 Motor Cycles in the last eighteen months, and we consider that the number of cash deals that we have had will not be twenty-five. Every month will find it more difficult to dispose of machines for cash. When the cash buyer does arrive, he wants so much taken off for his cash that, as a rule, he is not worth bothering about.

We have found an enormous success from our system of selling other people's machines on commission. The following is an example: You send us along your machine, for which you want £30. We sell you this machine for £30, less five per cent. (our commission), and send you a cheque for £28 10s. Our customer may probably give us an accumulator machine for this, together with some cash, and pay the remainder at so much per week; or he may exchange with us a magneto machine and the balance in cash. Or, again, he may pay one-third down, and enter into an arrangement to pay the balance by monthly instalments. All these are chances which you (a private seller) never have. You have to wait until some Sunny Jim comes along with thirty golden sovereigns. These boys are bad to get hold of, and, when you get them, they are the worst possible people to deal with, as they in almost all cases don't want to part with their money, and yet want the machine, so that we don't envy the private seller when he has to sell for cash. Besides these examples you will be deluged with letters from people wanting to exchange bull pups, fancy canaries, prize poultry, pianos, sideboards, typewriters, and other luxuries; also probably the man with a lot of money to dispose of, and the man who is in the farming line with a lot of cheese on hand, which he thinks you ought to accept in part payment for a motor cycle. They all write to the man who advertises. If you answer them all you will want a staff of typewriters, and if you don't answer them they will feel highly indignant. On the top of this, they may drop in on a Sunday afternoon, when you are having a siesta, and perhaps bring a sample of their wares with them. Then, again, there is the amusing gentleman, who has exceptional ideas of his credit, and who writes and tells you that he will send £10 and the balance in a month. This is all right if you happen to be able to persuade him to let you keep the machine while you get the second instalment; but if you don't, in nine cases out of ten you will get no more than the £10.

If you are busy in your own profession or business it means that you have to give a great amount of attention to this matter, which would be utilised to greater advantage in your own particular line. Taking one thing with another, it never pays the private seller to advertise his goods. Note the numerous gentry who lose their machines when they are tempted to go in for amateur motor cycle dealing. At the same time we have great sympathy with them in their losses, but would remind them that Hitchen's, of Morecambe, are still prepared to sell on commission, so that when they buy another machine, they will not repeat the mistake of indulging in the motor cycle trade without experience and the facilities for successfully carrying through this intricate business.

The fact that we get so many machines through daily to sell on these terms proves conclusively to us that the five per cent. charged is acceptable to our clients, who prefer to let Hitchen's put the deal through, and pay him his commission in preference to being bothered with these messing jobs themselves.

The above shows you how to sell motor cycles. Now for the man who wants to buy one. If you can drop across someone who has one to sell at a very cut price, and who will let you pay, say, £10 down, and the remaining £20 some time else, you cannot do better than purchase from him; but if you ask us, there are not many of this sort about. If you want to do a deal in a straightforward manner, without any bunkum and coddery, you cannot do better than write to us. Tell us what you want to buy, what you want to pay for it, and how you want to pay; and, if we cannot fix you up, no one else can. Of course, we are now talking of the man who wants to buy a machine, and not the chap who expects to get a present, such as a 1911 Triumph for £11. These we cannot entertain, nor yet shall we be able to accommodate the bloke who thinks that he should come across a nice motor cycle, with two-speed gear and sidecar, for about £12 or £15, because the season is

over. To such like we would casually mention that we never find the season to be over to this extent, as there is always someone wanting motor cycles, and our mail-bag is always full of enquiries, presumably because we always answer every letter—even from the funny man.

By the by, a most important reason why you should let us have your order is because we are the only firm in the whole world who send you goods on approval, and if they don't suit you, you are at liberty to return them and have your money back within three days and an exchange any time. Or, if it is a swap, have your goods back in the same way. We make no charge for these favours. There is one thing that we do want, and that is to give satisfaction. We have written week after week that if you are not satisfied with our treatment, write and let us know what is the matter. If you are not satisfied, and you don't write, it is your own fault, and you must grin and bear it. If you have a machine that does not suit you, there is no need to keep it. We are always prepared to exchange it for another one. If you ever hear a man say that he is dissatisfied with a deal from Hitchen's, of Morecambe, tell him from us that he must be a fool, otherwise he would get into communication with the firm, and have his dissatisfaction turned into satisfaction. What more can we do than this? There are some people who never are pleased. However, this sort we can do without. If you are open to be satisfied, we are always pleased to hear from you, and our motto is on each billhead, as follows: "Anything you buy from us which suits you, tell your friends; if not, tell us."

Until next week so long, bloys!

1911 MODELS.

ZENITH-GRADUA, 3½ h.p.	£55 0

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Northumberland, Cumberland, Durham, and Westmoreland.

York and Lancashire.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants.

Channel Islands.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

Somerset, Devon, Dorset, and Cornwall.

Scotland.

Ireland and Isle of Man.

WRITE FOR LISTS.

WAUCHOPES

THE CITY HEADQUARTERS
FOR ALL BEST MAKES,
**9, SNOW HILL,
FLEET ST., LONDON, E.C.**
Telegrams: "Opifcer, London."
Telephone: 5777 Holborn.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 20, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o 'The Motor Cycle,' 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hille and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

ADDRESS: 20, TUDOR STREET, LONDON, E.C.

The 1912 Tourist Trophy Races.

WE announce elsewhere in these columns that the Auto Cycle Union has again decided to hold the Tourist Trophy Race in the Isle of Man, subject to the permission of the island authorities being granted. That this permission will be given there is no reason to doubt, as the hospitable little island is only too glad to welcome the A.C.U. and the attendant crowd of motor cyclists which follows. The Motor Cycle Manufacturers' Union thinks otherwise, and many prominent makers are prepared to sign a bond not to support the race if it be held in the island and under existing rules, being of opinion that the expense of sending machines to the Isle of Man and of keeping the riders and their attendants there for a fortnight is too great, and that the other reasons given on page 1132 of our issue of October 26th justify their action.

Hardly a motor cyclist sportsman in the country will approve of this decision, and we feel sure that the majority will applaud the Auto Cycle Union for the attitude it has taken. The ruling body fulfils a two-fold purpose. Being a society of encouragement, it exists to develop the machine and to look after the sporting side of the movement, as well as to serve the interests of the motor cyclist by looking after his wants, by carefully fostering the touring side, by helping him legally, and in other ways. Consequently the Union would not be fulfilling its duty if it allowed such a magnificent event as the Tourist Trophy to sink into oblivion. This event, which is looked forward to with the greatest interest by practically every motor cyclist in the United Kingdom and the British dominions beyond the seas, is the only road race we

are allowed to have. It is a test for man and machine which can be obtained in no other way, and beside it a long-distance race on Brooklands is dreary, tame, and boring to a degree.

At Brooklands we see the men rush past the fork, see them tear beneath the members' bridge, look at them speeding down the railway straight—the same scene is witnessed from every point of view. Let our readers carry their imagination to the Snaefell course and compare this dreary procession with the corner work at the Ramsey hairpin and Devil's Elbow, the rush down the mountain road, the exciting anticipation of the arrival of the leading man at Woodlands, the thrills to be witnessed at every turn. The element of danger appeals to every true sportsman; the nature of the course tests every minute detail in the machine—particularly variable gears.

Is all this to pass away, and is the movement so soon to lead the humdrum existence to which the Society of Motor Manufacturers and Traders has brought automobilism? We hope not, and trust that every man will subscribe his mite to help the A.C.U. to run the race. Only think of it! If 60,000 motor cyclists subscribed a shilling the amount subscribed would be £3,000, which proves that if motor cyclists will only combine and each man send his little amount, and merely sacrifice 1s. worth of petrol in the year, this splendid event will be saved for some years to come at any rate.

Taking the manufacturers' objections to the race as a whole, we do not see why they should not be remedied, and having given the manufacturers' reasons for withholding their support and the views of the motor cyclist sportsmen, we wish success to the 1912 T.T. Race in whatever form it is run.

IN SEARCH OF STEEP HILLS.

AT the beginning of last week a small party of motor cyclists left Harrogate with the intention of conquering a couple of hills which were said to have never been climbed by any motor cycle. The first call was at Darley, where the party was augmented to the number of twelve. The objective was now Middle Tongue Hill, one and a half miles from Pateley Bridge, which the competitors in the last Six Days' Trial will remember as lying between Greenhow Hill and Brownstay Ridge.

The hill in question runs up the same side of the valley as Greenhow. It starts with a watersplash, is then very narrow for about four hundred yards, in which is a severe right-hand turn and also a left turn, the road then broadens out, finally running by the side of a quarry, and joins Greenhow at the top. A short time ago the surface was practically impassable, owing to the large amount of the well-known Pateley stone being carted, the quantity at one time being no less than an average of eighty tons per day. Now, how-

A move was now made for lunch, and then an attempt was made on Hartwith Bank, which runs from Summerbridge to Brimham Rocks. Grange and Atkinson again were successful. Fortune managed about two-thirds, and the rest stopped on various parts of the hill, one man finishing with his machine in the hedge. The gradient is not exceptionally severe, but

Group at the foot of Middle Tongue Hill, near Pateley Bridge.
The water splash will be noted.

the surface is atrocious. The trouble, of course, is to go slow enough to miss the bumps.

Altogether a very enjoyable day was spent, although the rain somewhat interfered with comfort.

W. Aldon ($3\frac{1}{2}$ three-speed Premier and sidecar) climbing the first stretch of the hill.

ever, there is very little quarrying, and the surface is in fairly good condition.

W. Atkinson ($3\frac{1}{2}$ h.p. Triumph), W. Grange ($3\frac{1}{2}$ h.p. Bradbury), T. Maynard ($3\frac{1}{2}$ h.p. clutch Triumph), and B. Tindall ($3\frac{1}{2}$ h.p. T.T. Triumph) all made clean ascents first attempt. H. Fortune ($3\frac{1}{2}$ h.p. Triumph) managed it on his second attempt, as did also W. Aldon ($3\frac{1}{2}$ h.p. three-speed Premier and empty sidecar). The remainder failed. The last rider could not negotiate the first corner owing to the sidecar lifting, but when held down by someone running by the side he was able to get round.

B. Tindall ($3\frac{1}{2}$ T.T. Triumph) negotiating the first bend on Middle Tongue Hill.

Occasional Comments

by "Lion"

Wear of Big End Bearings.

Mr. John Kennedy, jun., is most certainly within his rights in complaining of an engine which has required two new big end bearings within 5,000 miles. I wonder what he would say if, like myself, he were faced by a bill for £3 10s. for new connecting rod, crank pin, and bushes when the engine was similarly repaired only sixty miles back? Engines of different makes show the most extraordinary differences in this respect.

I have owned very few modern engines on which the big ends were unworn after 5,000 miles; and this year I have owned two engines which wanted new bearings soon after 1,000 miles had been completed. *Per contra*, as far back as 1903 I owned engines which developed no very perceptible wear in 10,000 miles; but we should remember that the $2\frac{3}{4}$ h.p. De Dion and M.M.C. engines of that date had larger crank pins and bushes than some standard modern motor cycle engines, and that they ran slower and had lower compressions. Also the machines to which they were fitted were seldom ridden such long distances at high speed as modern mounts. The public were offered their choice between the 'bus horse and the Arab type of engine; and with no uncertain voice they have declared for ultra-efficiency, which does not always spell durability.

One or two very durable engines are still made and sold, but the demand for them is comparatively limited, and they require the aid of a variable gear before they can compete with the ultra-efficient $3\frac{1}{2}$ h.p. as touring power-units.

No doubt in time the trade will manage to combine the durability of a 1900-3 $2\frac{3}{4}$ h.p. De Dion or M.M.C. engine with the ultra-efficiency of a 1911 Brooklands or T.T. single; but we cannot have all we want in the twinkling of an eye, and the trade has made enormous strides in a very short time. To my mind the most urgent requirement is a better lubrication system. I have seen a great many of these worn engines taken down, and my judgment is that the wear has not been evenly distributed over the 1,000, 2,000, or 3,000 miles which the engine has run. The damage usually appears to indicate that the parts have been short of oil for a few brief periods.

As long as most of us have to oil on our present hit and miss system, the engine is bound to be rather starved of oil for, say, five miles out of every twenty, and a little negligence on the rider's part, or a partial failure of the miniature and delicate valve at the base of a concealed automatic pump, leaves the vital parts without a saving film of lubricant between hot surfaces pressed forcibly into rolling or sliding contact under enormous strains.

I seriously consider that mechanical pressure lubrication must be the eventual solution for engines running at colossal speeds with very restricted bearing surfaces and light reciprocating parts. The real

question is whether we are going to use bigger and heavier bearings, with a probable loss of horse-power and an increase of weight, or whether improved lubrication would render the existing bearing dimensions and materials satisfactory.

As Mr. Kennedy says, it is common knowledge that the modern bearings are short-lived to a degree which no car owner would tolerate. I have just seen the inside of a very cheap car engine which has been worked hard for three years, and the wear of the big ends is practically negligible. [What is the compression ratio of that engine, and is it water-cooled? —Ed.]

The Control of Gears.

Under most circumstances where a variable gear is particularly useful, it is perilous to remove a hand from the steering bar. Riders in the last A.C.U. Six Days' will realise what I mean. Whether a gear change is necessitated by a wicked corner on a long hill or by atrocious road surfaces, it remains true that even a courageous rider will prefer to keep his hands on the grips. Even when sheer gradient compels the change, the surface is almost certain to be jerking the machine about so ruthlessly that two-handed steering is desirable, and I have seen more than one bad smash in hill-climbs this year due to one-handed steering by experts on rough going.

Moreover, we have to consider the duffer, not only the expert; and if we want our share of the colonial trade, we have to design with one eye on conditions usually more exacting than the worst English roads afford.

I could not help noticing in the 'Six Days' that many presumably expert riders changed gear on the hills long before their engines asked for relief, simply because the men did not care to face one-handed steering on stony ground.

On the other hand, foot-rest control is equally bad, since the gear control may be disorganised by a tumble; and, personally, I consider a three feet side lever a disfigurement to an otherwise neat and handsome two-wheeler. Consequently, pedal control of gears already standard on some machines is an advantage, but the pedal should be pivoted where it cannot be damaged by falls.

Two or three possible alternatives deserve more attention than they have received. Handle-bar control contains vast possibilities, provided the ratchets are not of a gimcrack kind, and that the leverage demanded for the operation of the gear is suitably reduced. There is room for a pedal control mounted sufficiently high up on the front down tube of the diamond frame to be out of harm's way in the event of a fall. There are possibilities in a knee or thigh control lying snugly up against the tank side. At present not a single type of control is free from criticism; but the majority of the trade appears to be content to play follow-my-leader.

The Adjustment of Lamp Burners.

By P. W. BISCHOFF.

OUR noble champion "Ixion," to whom we motor cyclists owe many of the detail improvements in our machines, has lately been having a tilt at modern lamps. While by no means concurring in his general denunciation of these, I freely admit that a good many lamps are sent out by the makers giving nothing like as much light as they should and can. It frequently falls to my lot to "tune up" ailing lamps, either for my friends or for makers.

Judging from the fact that I hardly ever fail to get a good light eventually from a given lamp, however badly it may seem to burn at first, I am inclined to think that the fault very seldom lies in the mirror or lens. Therefore, I am offering no suggestions as to these. Nor do I propose to discuss the care and management of generators: this is an entirely distinct subject. But I take it as assumed that the rider has one of the modern big lens-mirror lamps, that the generator is charged with clean carbide and clear water, that the needle-valve is seen to be passing water steadily and freely; and that there is no reason why the lamp should not give a good light. As a matter of fact I am taking a good deal for granted. In heaps of cases the trouble has been traced to air-lock in the water tank, dirt in the grooves of the needle, deposit in the gas passages, a sodden filter-pad, or a partially choked burner.

When the Generator is at Fault.

If your lamp occasionally comes to life and gives a glorious beam, even if only for a few seconds, for goodness sake do not meddle with the burner. The trouble is quite certainly generative, and a thousand to one is an intermittent airlock. Air *must* pass into the tank or the water cannot get out. There is somewhere a small hole to allow of this, probably either in the filler cap or beside the central needle. This hole takes a malicious delight in getting stopped up. Before now I have had a drop of water settle over it and play havoc with the beam till the vacuum inside the water reservoir broke it up.

I can offer a useful tip to anyone who suspects this trouble. Get a long tapered cork of good quality and

Fig. 1.—Diagram to show how a burner should be placed; the focus is at the point marked X.

I would urge every rider who is dissatisfied with his lamp to use every endeavour to eliminate generator failure before touching anything else. But if your generator works all right with the lamp of a satisfied friend, whilst his generator makes your lamp no better, then and then only do I consider you are justified in laying the blame at the feet of the burner. [Is the burner a biped?—ED.] I have used this

expression purposely, as it is at this spot, or rather at the foot of the burner-holder, where adjustment errors can mostly be found.

The true lens-mirror is a parabola, and this has a geometric point called its focus, such that all light proceeding from this point would be projected forward in perfectly parallel beams. The calculation of this focus is an abstruse mathematical problem in conic sections, and I have not the slightest idea how to do it. Nor is it necessary for the practical rider, because his source of light is a flame and not a point. But the best beam can only be obtained when the brightest part of his flame is placed dead in focus. This can only be done by trial.

Presumably the makers have carefully felt for this spot, and I am sure they have found it. Probably they use jigs to ensure putting every lamp on the market in proper tune. If they do not they ought to.

But it is quite unfair to expect that each individual lamp will receive a road trial. The average purchaser would strongly resent buying a lamp that showed signs of use, nor can we expect the makers to hinder their output as such a procedure would entail. Hence it does follow that an occasional lamp gets through their hands which admittedly needs focussing, but I find such lamps are extremely rare, nearly all trouble being due to dirty or careless handling of the generator.

Directions for Adjustment.

When the true exception has been found, there are three directions in which adjustment can be made—(1) the height of the flame in the lamp, (2) the distance of the flame from the mirror, and (3) the angle of the flame to the mirror.

(1.) It is in the first of these that most of the bad lamps are wrongly adjusted. Put the lamp on the machine and support the latter vertically. Now carefully align the lamp till it is parallel to the road. Light the gas and get the flame a good normal size. Now look closely to see where the flame comes. The focus is on the axis of the mirror, i.e., on a line drawn through its centre and at right angles to it. If the top of the burner comes nearly up to this line, it follows that the black base of the flame is in the focus and the brightest part well above it. Just the reverse may be the case, but it is most unlikely. Now loosen the burner holder and reset it so that the brightest part of the flame (as nearly as you can judge by eye) comes exactly opposite the centre of the mirror. You then know that the source of light is on the axis, but it does not yet follow that it is in focus.

(2.) If the lamp construction allows it, once more loosen the holder, and, without altering its height, slide it slowly nearer to the lens. Get behind the lamp and watch the effect on the beam. Settle at what point you get the best beam and clamp up the holder. But be on your guard not to have it too near the lens for fear of cracking it. Makers possibly send

Fig. 2.—Showing how to find the central line of focus.

Fig. 3.—The method of preventing air-lock.

The Adjustment of Lamp Burners.—

out their lamps with the burner rather on the far side for this very purpose. So do not push it right up to the mirror, "do in" the latter, and then blame the maker. He may not see the joke!

(3.) Having got the flame central each way and approximately in focus, if you are still dissatisfied with the result, there is yet one more adjustment available. Slacken the holder, and, without altering its centring, slightly revolve it so that the flame is not quite parallel to the mirror. Absolutely end on, we get a very penetrating beam, but very narrow. This is the method employed in micro-photography or any occasion when an intensely concentrated light is required. Such a beam is quite unsuitable in a motor cycle lamp, but a small twist makes a lot of difference, and I have found it an improvement in one or two cases. Yet the most probable source of error is that detailed under No. 1.

It is not easy to find the central focal line of the mirror. The method I adopt is as follows: First light the lamp and find out how far above the top

of the burner is the best bit of the flame. Next with a pair of dividers find the centre of the mirror and stick on it a small dot of white wet paper. Do not use stamp edging, or you will damage the surface of the lens in getting it off again. Now do the same with the front glass. Then replace the burner with a piece of copper wire twisted round it, ending in a loop which encircles the spot where the best light is produced. It is then a fairly simple matter to get this loop so that you can see the two specks of paper to be in line with it. A ring of white paint instead of the paper on the front glass gives one a very accurate means of alignment.

Having done this, one has really done all that is possible. If the burner is out of line sideways in the body, the lamp (and its maker with it) deserves scrapping. But the tips I have given have never yet failed me in getting a first-class beam. Still I would repeat, in conclusion, the warning I have already reiterated, namely, to take infinite pains to prove that the failure is not due to the generator before beginning to meddle with the focus.

VICTORS IN THE MIDLAND INTER-CLUB RELIABILITY TRIAL.

F. H. Southam (6 h.p. Zenith), winner of the P. J. Evans Trophy.

J. J. Woodgate (3½ h.p. two-speed Singer), second, winner of Humber medal.

SILENCE AND SILENCERS.

NOW that the question of silencing is seriously engaging the attention of the Brooklands Automobile Racing Club and the Auto Cycle Union, the following extract from a South African paper will be of interest:

**NOISY MOTOR CYCLES,
MAGISTRATE'S JUDGMENT.**

Johannesburg, September 28th.

An interesting case affecting motor cyclists came before the magistrate to-day. The police superintendent charged a motor cyclist under the Traffic Byelaws with riding a machine in Commissioner Street, alleging that the silencer of his engine did not effectually deaden the sound of the exhaust explosions. The accused, it was stated, went to the agents, who declared that everything was all right. Whereupon, the police got the opinion of an expert, who declared that the silencer was inefficient.

The magistrate said that his difficulty was that, if he convicted in this case, it would be tantamount to declaring that every machine of the make concerned was illegal.

A long argument resulted in the court adjourning to give the accused an opportunity of demonstrating on his machine.

The case eventually turned on the point whether motor cycles should have baffle plates on silencers or not, and the magistrate held that he could not decide against what is a world-wide practice, and say that silencers without baffle plates were inefficient.

We believe that Johannesburg is the first place in which the police have taken action against the rider of a machine fitted with a noisy exhaust. Unfortunately the only means of suppressing the noisy machine is by similar steps being taken, but it seems inadvisable to give the police the power to discriminate between noisy and silent motor cycles.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Heat-resisting Plugs.

Q. I have a 6.8 h.p. M.M.C. engine which easily overheats. The sparking plug is set immediately over the exhaust, and the heat has quickly ruined several plugs, causing the porcelain, etc., to split and do other damage. Will you kindly inform me what to do?—H.L.

Change the position of the sparking plug; it should not be over the exhaust valve.

C.A.P. on A.C. Tricar.

Q. Will you please inform me if a C.A.P. carburetter can be used with good results on an A.C. tricar? I fully endorse "Ixion's" opinion as to the qualities of the semi-automatic carburetter, and this is why I should be glad to hear of any of your readers' experiences with the C.A.P.—A.E.M.

We do not see why the carburetter in question should not be fitted to your tricar. Before ordering one, however, we should recommend you to correspond with the makers and ask how best it can be adapted to your vehicle.

A Carburetter Conversion.

Q. I have a 2½ h.p. Excelsior motor bicycle which I have fitted with new 26in. wheels, otherwise it is as it left the works about 1902, surface carburetter, etc. I can get 27 m.p.h. or an average of 20 miles. I have only had the machine ten months, but have done thousands of miles. Would you recommend me to have a spray carburetter, new frame and tank, and what would be the cost, or sell and buy an up-to-date one? I may say that I am satisfied with the engine, which seems good for ever, but do not like the look of the machine.—H.T.

Yes, we think you would find an improvement by fitting a spray carburetter. Probably the old tank could be made to do, and the fitting of the new carburetter would cost very little. If, on the other hand, you have a new tank and frame specially made, we should say the cost would hardly be worth while, and you would do better to buy an up-to-date machine. You could get an estimate for the cost of the conversion from your local dealer, or a rough cost of the tank from any of the firms making tanks whose announcements are published in these

A Motor Cycle in North Borneo.

Q. I am going out to Sarawak, North Borneo, in December, and would be very much obliged if you would let me know if the roads are at all suitable for motor cycling, as I am a very keen motor cyclist, and do not want to have to sell my machine, which is a 3½ h.p. 1909 N.S.U. What would be the approximate cost by the Nippon line?—H.R.S.L.

The roads in North Borneo are fairly good, and we think on the whole it would be worth taking a motor bicycle out there. In the Malay Peninsula, however, which is comparatively close, the roads are good. The cost would be approximately 50s.

Sidecars—Axles, Belts, and Tyres.

Q. I should like to have your advice on the following point. (1.) I have purchased this summer a Montgomery rigid sidecar, £9 9s. model (No. 8). I have seen so many references lately in *The Motor Cycle* to the danger of sidecar axles, etc., that I should like to have your advice as to the safety of this model. Do you consider the car safe for a passenger of nine stones on average roads at the legal limit of pace, or if not could it be made safe? The car is used with a 3½ h.p. two-speed 1911 Humber. (2.) Would you consider a Lomax steel-studded tyre to be recommended for the driving wheel of the bicycle? I find that the ordinary rubber tyre will not stand the bad roads here. (3.) As to belts. I have had trouble in this direction, wearing out a rubber belt of one of the best known makes, size 7in., in a thousand miles. What belt would you advise me to put on? Would leather be best and what make?—G.H.F. (Killarney).

(1.) We do not think you will have any danger from this sidecar, which is of reputable make, especially as you are not using it with a very powerful machine. (2.) The band in question should suit excellently, but the wear of tyres with a sidecar is often caused by wrong alignment, which causes the tyre to drag sideways. (3.) You must expect belt trouble if you use a 7in. belt with a sidecar; far better to try a 1in. belt. You might try a leather belt of 1in. section.

Llandrindod Wells to Manchester.

Q. If the weather is favourable, I intend riding on my 2½ h.p. Motosacoche to Manchester from Llandrindod Wells on Saturday, returning the following Monday. Will you kindly inform me which is the best and shortest route, giving the distances between the chief places passed through and the total distance? Can you also give me a different route to return on the Monday? I do not want to go through large towns if I can help it. The part of Manchester I want to get to is Higher Crumpsall. I should like, if possible, to get there without going through much of Manchester itself.—R.R.W.

Your route will be as follows: Llandrindod Wells, Rhayader, 13; Llanidloes, 14; Newtown, 14; Welshpool, 13; Oswestry, 15; Wrexham, 15; Chester, 11; Northwich, 13; Manchester, 20. Crumpsall, 4 (about). Return *via* Alderley Edge, Congleton, Crewe, Nantwich, Whitechurch, Shrewsbury, Ludlow, Leominster, Pembridge, and New Radnor. Crumpsall is on the far side of Manchester, and you can only avoid going through the latter by turning off and going through Salford.

Wanted—A Runabout.

Q. I should feel very much obliged if you would let me know the name and address of the makers of the Morgan Runabout, built with 8 h.p. twin-cylinder and illustrated in *The Motor Cycle* of October 19th containing Quarterly Trials report. Would you be kind enough to give me at the same time the names and addresses of those whom you consider the best makers of tricars and light runabouts in England? I am a Belgian, but I consider that the best makers of tricars are in England.—F.D.

The address you require is Messrs. Morgan and Co., engineers, Malvern, Worcestershire. This machine and the A.C. (Auto-Carriers, Ltd., Martell Road, West Norwood, London, S.E.) are the best-known tricars in England. Humber Co., Coventry; G.N.—Godfrey and Nash, The Elms Motor Works, Golder's Green Road, Hendon, London, W.; L.M.—Wm. Cunningham, Clitheroe, Lancashire; Crescent—Crescent Motors, Pleck Road, Walsall; Sabella Motor Co., Ltd., 33, Southampton Street, Strand, W.C., and Crouch Motor Co., Coventry, all make runabouts.

Silencers.

Q—Which is the quietest silencer on the market? My machine is a 2½ h.p. J.A.P.—G.H.J.S.

There have been no recent silencer tests, so it is impossible to answer your question with certainty, as the winning silencer in the last test is no longer made. Silence without back pressure is largely a question of size. A long exhaust pipe is a help.

How to Protect a New Idea.

Q—I have an idea for an improvement on the present sidecar. There is not, to my knowledge, one on the market built in the same way. Can you inform me if I can have my idea registered, where, and what proceedings to take, and how long a registered pattern holds good for protection of same?—SIDECAR.

The best thing you can do is to put the matter in the hands of a good patent agent. We can give you the name of a good firm of patent agents who have had considerable experience with motor cycle design if you desire it. If you feel capable of wording your own specification and making the drawings you can obtain a provisional patent for £1. This you get on application at the Patent Office, Southampton Buildings, Chancery Lane, W.C. It holds good for one year.

Lamps on Approval.

Q—I advertised for a motor cycle lamp. I got an answer from an agent. The person in question sent his lamp on approval, and said he would refund my money if the lamp did not suit me. When the lamp arrived I did not like it, and more than that, the lamp glass was broken. I signed unexamined on the railway company's sheet, but I knew I could not claim anything because it was not sent at "glass rate." I returned the lamp by rail to the agent securely packed, but did not advise him that the glass had been cracked. In the meantime I ordered my post-dated (five days) money order to be stopped at the local post office. The owner of the lamp claimed from the railway company, but they would not pay anything because it was not sent "glass rate." He went to the post office to cash the money order but found it was stopped. He then asked me to pay for the damage, or let him cash the order and send me the lamp back. He says he has missed a chance of sale through the glass being broken and claims that it will cost nearly 15s. repairing and cost of postage to and from the makers. It is an old-fashioned Polkey projector with 5in. divided front glass. He says he will be content if I pay (7s. 6d.) half of the damages, and he will stand the rest. I have told him I will not pay a cent. He now threatens to summon me if I do not settle at once. (1.) How should I stand with the case in a court of law? (2.) Or what do you advise me to do? I may add that I do not want the lamp, and he refuses to return the money order until the matter is settled. (3.) Can I sue him for illegal detention of the money?—E.L.

Our legal adviser writes as follows: "Assuming there is nothing in the advertisement, or in the correspondence, to show that the lamp was being sent at 'E.L.'s' risk, your correspondent has a good defence to any action which may be brought by the agent in question. I presume he can conclusively prove that the lamp was in the condition he states when it arrived. He is quite right, therefore, in refusing to pay the 15s. claimed, or any part thereof. I do not quite understand the latter part of the query, as it would appear from the letter that the particular agent has not cashed the money order. If this is so, there can be no action for illegal detention of money. The money order being now valueless, he surely need not trouble about the return of that."

EXPERIENCES WANTED.

"J.K." (Huddersfield). Free engine Triumph and sidecar, also free engine Bradbury and sidecar.
 "C.R.W." (Brighton). 5-6 h.p. Clyno with sidecar.
 "J.D." (Dumbarton). 3½ h.p. Scott, consumption and wear of clutches.
 "H.J.H." (Toronto). The A.S.L. with regard to comfort and reliability.
 "H.L." (Polesworth). Indian, 5 or 7 h.p., reliability, consumption, and running costs.
 "J.S. 101" (Dingwall). Morgan Runabout.
 "T.J.L." (Headingley). Model D 2½ h.p. Douglas, engine reliability.
 "D.H.G." (Dartmouth). 2½ h.p. two-speed Enfield; speed, hill-climbing, and silence.

BIG GAME SHOOTING BY MOTOR CYCLE. C. Theobald, of Mysore, S. India, who, with his brother, do all their shooting with the help of the 2½ h.p. F.N. and Miniford sidecar, illustrated. The photograph shows the last panther they got twenty-five miles from Mysore.

An Admirable Crichton of Sport.

A Great Cricket and Football Player Enthuses over his Motor Cycle.

THE name of Mr. Jack Sharp is as a household word in the realm of sports and pastimes, for he holds the highest honours that the world can offer for football, as a member of the Everton F.C., League champions and English Cup winners; he has played for his country at cricket and football; he is one of the Lancashire County stalwarts with the bat, and does many a turn at bowling; also he is keen on golf. And it is the same with the motor cycle. I saw the sunny-faced, cheery-natured son of Herefordshire in the early summer very enthusiastic about motor cycling, and when I got in touch with him again specially for *The Motor Cycle* it was to find that the attractions of the pastime had not faded one jot or tittle, but that he had changed his machine, and added unto it the supplementary responsibility of a sidecar. Mr. Jack Sharp is a veritable Boyle-Roche bird, seemingly in two places at once. It's the motor cycle that gives him this startling ubiquity, from his sports outfitting depot to some golf links, or on to the King's highway, far from Liverpool's strenuous life.

He has been a petrol user for only about twelve months, and his "introductory" mount was a Triumph of 1907, which taught him much of the wonder-world that awaits the motor cyclist out for pleasure. He now has an 8 h.p. twin Matchless-Jap, and never takes the sidecar off it. This passenger-carrier, by the way, is a Montgomery (castor wheel), and he is immensely impressed with the sociability of the combination. Mrs. Sharp has grown equally fond of the attachment, and, owing to the ample engine power and two-speed gear, there is never any possibility of having to walk up hills.

Some of Jack's renowned friends of the field of play are already envious, and his famous colleague, Mr. J. T. Tyldesley, ensconced himself in the sidecar one day for a jaunt to Cambridge and back—180 miles each way—and everything went as merrily as the proverbial wedding bells. Mr. Sharp, however, has

not yet deemed it advisable to use his motor cycle for transporting him to Old Trafford, or from there to other parts of the country, to fulfil his cricket engagements, though this state of affairs may change ere long. Generally Jack-o'-both-sides, as he has aptly been called because of his versatility at both cricket and football, has contented himself with day and week-end jaunts. He has scoured North Wales so well that the machine can very nearly find its own way along some of the best-known highways.

"I haven't had any trouble with my present machine," he added, feelingly; and when I asked him whether he was an Expert mechanic (capital E, please) as well as The Expert Sports Provider (see catalogues!), he replied, with that characteristic modesty of his, "Not expert, but I have a useful knowledge."

To those, therefore, who hesitate to buy and board a motor cycle for fear of (largely imaginary) troubles, Mr. Jack Sharp's example is encouraging.

I was hoping my old friend, whose fleet foot, eagle eye, and supple wrist one has seen and admired for so many years, might have kept a diary record of mileages and expenses. He has

not, however, but he hastened to add, for the benefit of all whom it may concern, that, as regards financial outlay, the motor cycle is not a heavy drain at all. He is, by the way, not the only one of our great cricketers who motor cycle, for one might mention Messrs. Arnold (Worcestershire) and Kinneir (Warrwickshire).

In conclusion, quoth Mr. Sharp, "I'm in love with the motor cycle. Apart from pleasure spins of length, I use it for getting to various golf links, and the two combined have helped me a good deal to counteract the fact that this season I have retired from football."

In answering this advertisement it is desirable to mention "The Motor Cycle."

Are you "friends" with the road—rough or smooth—is it all the same to you—or do you find the rough annihilates your pleasure and makes you quarrel for the nonce, not only with the road, but with the pastime as a whole? If the latter, then you lack true saddle service. . . . That's the link that makes for friendship—kills vibration—and makes the surface of the road a matter of indifference. . . . And riders of the BROOKS will tell you that there is only one Saddle which makes that service possible, the Saddle which, in all its models, embodies that exclusive feature—the BROOKS Patent Compound Spring—the spring that absorbs vibration within itself yet, by its compensating action, eliminates all tendency to bounce. . . . Are you "friends" with the road?—If not, just change your saddle for a

NEW DESIGN
MOTOR CYCLES

1912 MODELS

TO BE EXHIBITED
AT OLYMPIA.

Olympia, the Mecca of motor cyclists, opens its doors on Monday, November 20th, at 10 a.m., and closes at 10 p.m. The Exhibition finally closes on the following Saturday, the 26th inst. The price of admission is 1s. The number of motor cycle exhibitors at this second annual show is a record, viz., 169. All readers who can, should find time to pay a visit. Below we continue our illustrated forecast of the exhibits. Our next two issues will be special numbers chiefly devoted to the Show, viz., Thursday, November 16th, *The Motor Cycle Buyers' Guide*, and November 23rd, Olympia Show report.

The 2½ h.p. Two-stroke Stuart.

The 2½ h.p. two-stroke Stuart motor bicycle which will be shown on the stand of Messrs. R. G. Nye and Co. is manufactured by the well-known engineers, Messrs. Stuart, Turner and Co., Ship-lake Works, Henley-on-Thames. The most interesting part of the machine is the power unit, since the bicycle part follows lines adopted by most manufacturers. The two-stroke engine, 71 x 75.5 mm., is of the two-port type, and has the transfer port G neatly cast in the cylinder. Compression is retained in the crank case by means of patent oil-retaining ball bearings, details of which we are not yet at liberty to disclose. It suffices only to say that the firm's experimental machine which has been running for a year shows no trace of oil leakage, and has one of the cleanest and neatest crank cases we have seen. It is as free as possible of projections and has no lettering, and so is easy to wipe down, though cleaning does not appear to be necessary. The piston, which has two wide rings, possesses the usual deflector common to two-stroke engines, while the connecting rod is of steel, and is bushed at both ends. The flywheels have a heavy periphery, and are fitted with aluminium plates to enclose the space formed by the periphery and inner disc, so as to reduce the compression area in the crank case. The crank case is provided with a safety release valve A. It is well-known that two-stroke engines

when they do backfire (which is not often) do so into the crank case, and in the case of a crank case explosion in the Stuart the safety release valve would allow exit for the increased pressure.

The lubrication system is interesting. Pressure issuing from the crank case through the non-return valve B is delivered into the oil tank, which forces the lubricant through the controllable sight-feed on the top tube, and into the cylinder walls at the union H. A hand oil pump is provided merely for the purpose of injecting oil into the crank case when the latter is empty. The carburettor is the well-known Amac.

from which gas enters the cylinders through a non-return valve F. The valve casing is held on by a stirrup fastening, and so can be easily dismounted. To remove the power unit from the frame it is only necessary to withdraw the footrests C,

and the bolts DD. The valve E is the compression release which serves the same purpose as the exhaust valve lifter on a four-stroke engine. It will be seen by the illustration that the released compression to avoid noise is conducted to the exhaust pipe. The ignition is by chain driven Bosch magneto, handle-bar controlled. The adjustable pulley, which is simple and ingenious, can be altered without the aid of tools, and gives gears from 4 to 6½ to 1. The movable flange has two dogs which engage with steps cut in a rotating ring which by the aid of a ball catch stays in the required position. The accompanying illustration of the pulley is practically self-explanatory. The engine is full of ingenuity, and a pleasing change from the monotony of the standard type of machine now so

1912 Models.—

Next year's $3\frac{1}{2}$ h.p. 85 x 88 mm. single-gear'd Singer.**Singer Improvements.**

The Singer Company have made it their endeavour to produce as light as possible a $3\frac{1}{2}$ h.p. machine to give lasting satisfaction, and to be fitted with all necessary refinements. From an inspection of one of their 1912 mounts we may say that we consider that they have succeeded admirably.

The engine retains all this year's features, but, as will be seen from the illustration, it has been altered in the timing gear.

Only one intermediate wheel is now placed between the exhaust cam wheel and the magneto, and the gear case cover is held on by counter-sunk screws instead of nuts. This gives a considerably neater appearance to the engine, and should reduce gear noise. The combined valve cover and trouser guard is now shaped to the top of the crank case, while large windows are cut opposite the valve chambers so as to allow more air to pass for cooling purposes. All control levers

Improved spring snap terminal fitted by the Singer Co. to Bosch magnetos.

now have rounded metal ends formed on the lever, and so prevent the loss of screwed-on knobs and the consequent discomfort to the fingers. A neat front wheel stand is fitted to the front forks. The model we inspected was fitted with a plate clutch in the rear hub operated by pedals conveniently placed and coming under the right foot, the foot brake being on the left side. A very simple terminal is fitted to the high-tension lead from the Bosch magneto, and consists of a long vulcanite collar fitted with a split brass "push-in" end (illustrated herewith). The frame design and engine generally have undergone no important alterations, but the tank has an improved finish, and the oil pump is set at a greater angle so as to be more conveniently operated.

The new $3\frac{1}{2}$ h.p. Singer engine showing combined valve cover and trouser shield, also position adopted for the gear-driven magneto.

The Trump-Jap adjustable pulley dismantled.

gallons of petrol and half a gallon of oil and is carried by four clips. Each of these clips is screwed to a bridge piece holding the tank well away from the frame, and on the inside is fixed to a strap passing round three sides of the tank. We are told that this is the one tank construction which cannot be smashed at Brooklands. Lubrication is by a positive glass barrelled oil pump on the outside of the tank, but Best and Lloyd semi-automatic sight feed lubrication can be fitted as an extra. The B. and B. carburetter is employed on the Tourist model, and on the T.T. either J.A.P. or C.A.P. can

1912 Models.—

be fitted. The magneto is placed in front of the engine, and supported on a bracket cast with the back of the chain case. A special type of Druid forks is used, and the front wheel has ample side guards. The finish is in grey, the tank being aluminium, with a green panel, while a transfer representing the Ace of Hearts and underneath the word Trump is

Elevation of Canoelet sidecar axle and plan of stand and clip. A, flange to deflect mud. B, left washer. C, tubular stand. E, revolving lug brazed to stand. F, mudguard.

certainly distinctive. Both head lugs and bottom bracket lugs respectively are cast in one. There is one other feature which we do not remember seeing elsewhere, that is that the belt rim is both spoked on and clipped to the wheel spokes. As will be seen from our illustration, the machine has a low saddle position, and is in every way built for hard work.

Canoelet Sidecar.

The accompanying illustrations show a very original sidecar made by Messrs. Mead and Deakin, 61, Ladypool Road, Sparkbrook, Birmingham. The frame

consists of a tube bent hairpin fashion, the bend is in front, and the two ends are turned upwards at the back almost to the top of the body, which is attached at this point to laminated C springs and shackles. There are two transverse tubes at the back of the frame, a continuation of the lower of these is attached to the motor cycle near the centre of the back wheel, while the upper is bent forward and clipped to the saddle pillar. This arrangement, with special clips of quite original design, gives a very rigid frame. The body is coach built and very comfortable, the angle of the seat being adjustable; there is ample room and protection for the feet and a glass screen is fitted. The weight is 77 lbs. Another 15 lbs. must be added for screen and luggage carrier. The front clip consists of a slotted sleeve cone shaped at the end, which, when screwed up, grips the tube firmly in any position, somewhat after the manner of a carburetter attachment, making further adjustment unnecessary. A neat luggage carrier is fitted in the rear, which when not wanted folds up against the back of the sidecar.

The suspension of the Canoelet sidecar, also showing folding stand.

The stand when not in use takes the place of a rear mudguard stay. The vertical mudguard stay has a flange at the bottom to carry any mud which may run down the stay from the bearing. A delivery body is made which is interchangeable with the ordinary sidecar.

Veloce.

Last week we were shown a most ingenious motor cycle manufactured by the Veloce Co., of Birmingham. The frame is on standard lines, having a dropped top tube, Druid forks, and side flaps to front guard, but the engine and two-speed gear are distinctly novel. The engine has a solid crankshaft supported

Sectional drawing of the Veloce power unit, and two-speed counter-shaft gear in front of the engine.

on one side only by two ball bearings; between these bearings lie two gear wheels, fixed to the crankshaft. In the front part of the crank case lies a counter-shaft carrying two special bronze gear wheels, formed to take a double conical clutch within. These gears are always in mesh, and one of them runs at half engine speed and acts as a timing wheel. The double-faced clutch is actuated by a quick thread screw, and locks either one or other of the special bronze wheels to the counter shaft, on the near side of which is fixed a 6 in. pulley.

The lubrication is most ingenious. In front of the counter-shaft and driven by

Side view of the new Canoelet sidecar, which has many original features embodied in its design.

Rear view of sidecar showing the luggage platform folded up and the sidecar stand in operation

1912 Models.—

an intermediate wheel lies the magneto and a small eccentric oil pump. This pump draws oil from a filter placed in a large sump below the crank case and delivers it, through a regulator with a sight indicator, through a pipe joined to the gear case into the hollow counter-shaft by means of a cap constantly filled with oil from the pump. From the counter-shaft oil holes are drilled to the gear bearings and cams, the holes in the cams being arranged so as to throw oil direct on to the big end bearing, it then returns to the crank case and sump.

Power plant of the new 2 1/2 h.p. Veloce two-speeder.

The engine has a bore and stroke of 68 x 76 mm., and is fitted with a 9 1/4 in. outside flywheel. Both valves are mechanically operated and are situated in front of the cylinder, the inlet over the exhaust. No oil reservoir is fitted to the tank, as the sump holds two pints and is fitted with a large filler cap from which the level can be seen. The gears are operated by a double pedal on the right side of the machine, and from a short run we found the machine and gears

Three-quarter view of the 1912 model 3 1/2 h.p. Brown and sidecar.

very silent and easy to work. The engine is rated at 2 1/2 h.p., and is fitted with Bosch magneto and B. and B. carburetter. The large pulley in front of the engine should make for immunity from belt slip. The option is given of three gear ratios—5 to 1 and 8 to 1, 5 1/2 to 1 and 9.55 to 1, and 6 to 1 and 10.2 to 1. A point we raised in connection with the lubrication system as to whether the crank case could be kept oiltight with the considerable amount of oil used was answered in the affirmative, and certainly the engine we tried was almost spotless.

The Brown Motor Bicycle.

It is not surprising that a firm like Brown Bros., Ltd., which has been steadily engaged in the motor cycle industry since 1902, should in 1911 have brought its motor bicycles to such a state of perfection that startling innovations are not needed. There is, however, we understand, to be shortly added to

the Brown a two-speed gear and free engine, the details of which are unfortunately not yet available. The Brown motor bicycle is a well-designed and well-made machine, fitted with the 3 1/2 h.p. engine which has performed so well in the past in the hands of R. M. Brice, good spring forks, stand and luggage carrier, petrol gauge, and other items, which the A.C.U. judges sum up under the heading of "convenience." The lightweight 96 lbs. model, 3 h.p. 70 mm. x 76 mm., will also be shown, and a new type of sidecar, fitted with comfortable basket body. The sidecar is of the rigid variety, and has, we understand, met with great demand. It is illustrated herewith fitted to a 3 1/2 h.p. Brown motor bicycle.

F.N.

The alterations to the four-cylinder F.N. for 1912 are comparatively few—the machine having given universal satisfaction, the makers have not found it necessary or advisable to make more than a few minor improvements. The magneto machine is provided with a distributor combined with the magneto, as is the usual practice on cars fitted with four-cylinder engines; previous models have had a separate distributor for the four sparks, with the usual motor cycle type contact maker. The sparking plugs are specially short, and to obviate any possibility of short circuiting owing to the reduced length of the porcelain insulators, special ebonite connections are fitted to the terminals of the plugs. A special type of B. and L. combined drip feed and hand lubricating pump is fitted in

Clutch control lever of the 1912 model four-cylinder F.N.

Another new model, the 2 1/2 h.p. Veloce two-speed machine.

1912 Models.—

the fore part of the main tank. The front mudguard is now provided with metal side wings, and a strong tubular carrier and stand are fitted; these supersede the combined carrier and stand which was fitted to order for the British market. Now the stand is pivoted to studs on the frame, and does not depend on the rear wheel spindle for attachment; it also forms the stays for the mudguard. The carrier is a solidly built up article and strong enough to carry a passenger on if desired.

The new F.N. magneto machine with combined distributor.

The saddle position is slightly lower, and 10 gauge spokes are used for the driving wheel. The 1911 2½ h.p. lightweight was always provided with an outside adjustment for the bevel gear. This convenient refinement has now been added to the four-cylinder model for next year and enables the small bevel pinion to be accurately meshed with the large gear wheel with comparative ease. Other minor improvements are increased leverage to the rear brake and Bowden wire to operate it from the handle-bar. The 2½ h.p. lightweight two-speed model remains unaltered.

The 1912 model four-cylinder bevel driven F.N.

1912 model 7-9 h.p. twin-cylinder Indian, with foot-starting device and two-speed gear.

Indian Improvements.

The Hendee Co., so we were informed by their London manager, Mr. W. H. Wells, have decided to market two Indian models only for 1912, viz., the 3½ h.p. single-cylinder and the 7-9 h.p. twin. The standard models will both have the free engine clutch on the counter-shaft and a slightly altered frame. Both the single and twin will be supplied with the counter-shaft two-speed gear and free engine device to order, but the change speed gear cannot be supplied for the standard models after they have once been purchased as single-geared machines. A foot starting device is a feature of all patterns, and this is illustrated in the photograph of the complete machine. On the engine-shaft a free engine clutch enables starting to be effected by means of the chain and chain wheel shown. The crank is pushed forward, one downward thrust of the pedal revolving the engine one complete revolution. Folding foot-boards and no pedalling gears are also features of the new machines.

The rear driving chain is neatly protected by a metal guard on the lines of

the protector already fitted to the 1911 models. This guard is readily detachable, and should increase the life of the chain by keeping it free from mud and dust. The brakes are two, on the rear wheel. One is an internal expanding and the other an external contracting band brake; they are Raybestos faced and fitted on the right side, thus facilitating the removal and lubrication of the driving chain. Both brakes are foot controlled, as in the 1911 T.T. models. The hollow spindle fitted to the front wheel this year will also be used for the rear wheel in

Showing the notched quadrant control on the new variable gear Rudge, also large square filler caps.

1912. This enables the wheel to be removed from the machine in one minute. An innovation, so far as motor cycles are concerned, is the adoption of Timken roller bearings to the hub of the rear road wheel. The 1912 petrol tanks hold two gallons of spirit. The tool case on the Indian is metal, arched over the top tube of the frame, and occupies a space midway between the saddle peak and the steering head. The case contains a leather tool roll, which is made to fit snugly in the case.

The standard finish is blue, with tyre rim edges nickel-plated.

The Midget Bicar.

The Brown Midget Bicar, for the design of which Mr. J. T. Brown, Reading, is responsible, still retains its unusual but wholly successful sheet steel frame, built up on ash stays. The illustration of the ladies' model, now provided with doors

1912 Models.—

to allow easy access to the engine, shows the position in the frame the wood stay takes. Two bars of wood used are with the grain running different ways, and the bars are firmly bolted together. While at Mr. Brown's works we were shown a photograph of one of these machines, the front forks of which were completely smashed up owing to a collision with a wall, while the frame was untouched. The chief novelty in the Midget Bicar is in the expanding pulley gear. Formerly the back wheel was moved backwards to tighten the belt by tilting the footboards, the wheel being locked in place by a hand lever on the top tube.

The three-speed pulley on the 1912 Midget Bicar. The pull (by the operating fork) on the spindle A draws the pawl B out of engagement with the ratchets.

The new mechanism, however, does the whole process of contracting or expanding the pulley and adjusting the belt tension with the aid of one lever. This when pushed forward operates the pulley, and when pulled up or pushed down slides the rear wheel backwards or forwards. The lever works up or down in leather-faced guides, and is provided with an expanding grip brought into play by twisting the knob at the top. Moving the lever backwards or forwards gives the lateral movement to a fork which operates the expanding pulley. The loose flange of this works in an ingenious manner, and is locked by means of a ratchet and pawl; the operating fork pulls on a spindle which immediately releases the pawl and allows the pulley to be expanded to one of the three notches, or, if desired, at once to its extreme limit, which is, of course, the lowest gear. When pressed in, the flange engages the pawl into one or other of the three notches, and the pawl prevents it from slipping back against the pressure of the belt. The models shown on Stand 87 will be a $4\frac{1}{2}$

The lady's Midget Bicar sheet-metal frame. The dotted lines show the supports.

The new Gloria sidecar, features of which are the patent spring wheel and the special frame fixings.

b.p. single-cylinder for sidecar, a $3\frac{1}{2}$ h.p., and a $2\frac{1}{2}$ h.p. lightweight, while one lady's machine will also be exhibited. Precision engines will be used on all models.

The New Zeniths.

To talk of improvements in the Zenith is to talk of painting the lily. But such a talented designer as Mr. F. W. Barnes is not the sort of man to deny that what he has introduced cannot be brought still nearer perfection. For 1912 he has started an innovation quite as important as the introduction of the Gradua gear, but of a much more simple nature. We all know what a tedious matter it is to remove a back wheel from a motor bicycle,

Zenith fork-end for detachable wheel.

and no one apparently has been more alive to the fact than Mr. Barnes, as he has made the Zenith rear wheel detachable in about thirty seconds. This is considerably quicker than the smartest

amateur motor car driver can remove a detachable wheel on a car, as, in addition to getting out a special spanner, a mallet, and a jack, he has to raise the wheel off the ground to detach it, while the Zenith stand comes into action in two seconds.

Combined rear number plate and reflex light on the new Zeniths.

Were there room to carry one conveniently, a spare wheel complete could be carried and utilised in the 1912 Zenith. The improvement is simplicity itself. Two fork ends are screwed into the sliding plungers in the chain stays, and adjacent to the near side one the brake carrier is fixed, the end of which is also shaped like a fork end. To detach the wheel it is only necessary to slack both the spindle nuts, drop away the brake carrier, hold it to one side, twist

1912 Models.—

the wheel to clear it, and the rider is free to mend a puncture or change a cover. Barnes will be probably wheel changing against time at the coming Show.

The slots through which the plungers slide are now underneath the chain stays, so that any dirt which may adhere when wet, falls away when dry. The 1912 Zenith frame has its top tube slightly dropped at the rear, and has a horizontal seat-pillar, but should the purchaser be a tall man provision is made for a vertical seat-pillar. The spacious luggage carrier is bent over and fastened to the rear guard, and above where it joins the latter a number-plate is fixed at the bottom of which a red reflector is fitted as a standard. The position and design of the brake pedal have been improved, so that the pedal may be operated by the toe if the rider's foot is on the rear footrest, or by his heel if his foot is on the front rest. The rear footrests are now made easily detachable, so that they may be removed to be straightened if bent by a fall. The engine is now built into the diamond portion of the frame, and the back forks and chain stays are bolted on separately. The silencer of the single is now made so that it can be easily detached for cleaning, and the two ends are rigidly bolted to the engine cradle. Other improvements are a cover to the gear-

Sturdy design of steering head on the new Alldays.

angle after hardening. The models shown will be the $3\frac{1}{2}$ h.p. single-cylinder and the 6 and 8 h.p. twins with and without sidecar attachments

operating chain between the sprockets, and a new method of lubricating the expanding pulley by injecting grease through the hollow engine-shaft by means of an injector supplied with every machine. The faces of the pulley flanges are ground to the correct

A new model for Olympia. The twin-cylinder two-speed Rex-Jap, which as its name implies, is a Jap-engined machine, built in the Rex works. It is sold by the Premier Motor Co.

Zenith rear wheel and special attachments rendering the wheel readily removable.

New Imperial Cycle Co.

The above firm is marketing three entirely new models, these being a $4\frac{1}{2}$ h.p. sidecar machine, a $3\frac{1}{2}$ tourist, and a $2\frac{1}{2}$ lightweight. The sidecar vehicle is very carefully designed, and is the result of long tests. All lugs for brake rods, guides, and sidecar attachments, are

Design of crank employed on the New Imperial motor cycles to enable a straight rod control to the clutch.

The clutch-operating pedal mounted on a special lug of the New Imperial.

Latest model $3\frac{1}{2}$ h.p. Zenith-Gradua, the improvements in which are enumerated in the reading matter.

brazed to the frame and have a very neat workmanlike appearance. A $4\frac{1}{2}$ h.p. single-cylinder engine of 90 mm. bore \times 96 mm. stroke is fitted vertically in the frame and drives through a Roc two-speed gear situated in the rear hub. The chief feature with regard to this engine is the fitting of a ratchet exhaust lifter which enables the rider to lift the valve right off the seat or to leave it just clear. It is claimed by the makers that when running at moderate speeds the engine keeps cooler and develops more power when the valve is held very slightly off its seating. The clutch and brake pedals are carried on special studs fixed in the engine plates and quite separate from the footrests. Side flaps are made in one piece with both front and rear mudguards, and the finish is in dark green suitably lined. A substantial stand is used and the carrier is brazed to the frame; a special sidecar is being manufactured with heavy gauge tubing, and we understand that by show time we are likely to see something quite new in this line coming from the new Imperial works

1912 Models.

The first point to strike us on the 3½ h.p. model was the transparent bronze finish. We hear that this has excellent wearing qualities, and it is certainly neat and distinctive. The engine has a bore and stroke of 85 mm. × 88 mm. respectively, and the machine is in most

A 1912 Triumph refinement. The carburettor and high tension wires are carried in a neat metal tube as in car practice. Observe also needle valve to petrol injector.

respects similar to the 4½ h.p. type; it is, however, fitted either with fixed gear or a hub plate clutch. The 2½ h.p. lightweight is finished in black, and can be fitted with the Armstrong three-speed hub gear; the pedals for operating this are carried on a lug brazed to the frame. All three types have dropped top tubes, giving a low riding position, comfortable V handle-bars joined by cross bar and Druid forks. The brazed-on lugs make a very clean job, and we hear that in future even the controls will be brazed to the handle-bars.

1912 Triumphs.

This week we are enabled to outline the Triumph Cycle Co.'s programme for 1912. The four models which appeared at Olympia last year will be retained, and an additional one, the two-speed machine illustrated and described in our last issue, will be first exhibited to the public gaze at the Show. We are given to understand by Mr. Schulte, however, that it will be shown more to interest motor cyclists than anything else, the company making no secret of the fact that they are not so

enthusiastic over this mount as over their single-geared machines.

The 1912 catalogue models are as follow: 1, the free engine machine; 2, the roadster model (with pedals); 3, the T.T. roadster; 4, the Tourist Trophy racer.

The curved clutch pedal and adjustable dropped footrests on the new Triumph.

The improvements in next year's mounts at once attract the eye. The tank has been altered considerably, now being made with round top edges, the one longitudinal seam and riveted end still

1912 model 8 h.p. Dot-Jap fitted with V.S. gear and handle starting. This machine may be inspected on the Service Co.'s stand at Olympia.

being used. The tank fixings are underneath. Instead of the clips and screws around the top tube, a flat plate formed on the tube under the tank extends the whole width of the tank, which not only considerably strengthens this portion but gives it a much neater appearance. Needle valves have superseded taps in respect of petrol feed to carburettor and injector, whilst the screwed-on filler caps give place to a patent push-on spring cap.

Foot-operated Spark Advance.

The most novel departure is in connection with the advance and retard of the magneto contact breaker. A tiny pedal is mounted on an extension of the foot brake spindle, its movement being geared up from the contact breaker disc. We are told that this device works perfectly in practice.

The pedal operated magneto spark advance on the 1912 Triumph. A movement of the tiny pedal results in a much smaller movement of the contact breaker disc.

The 1912 pattern 3½ h.p. free-engine Triumph.

The footrests have been considerably amended in design. They are now dropped several inches lower than formerly, and, what is still more important, they are adjustable, and so may be canted at any angle to suit the individual rider. The new pattern spring fork, with large single coil spring acting in tension and compression, which has had severe testing all this year, is, of course, adopted as standard for 1912; and a new Brooks-Triumph saddle, with Brooks's patent compound springing and the seat

1912 Models.—

portion of padded pigskin, shaped anatomically, should conduce to much more comfortable riding. In future, Triumph machines will have belt rims for $\frac{3}{4}$ in. or lin. belts.

A new design of front brake has also been adopted. Instead of the stirrup which operates the brake shoes protruding through the front mudguard (which weaken the latter and cause breakages), they are now farther apart, and are outside the guard. Another advantage of this arrangement is that the stirrup, by overlapping the front guard, does not interfere with the removal of the latter fitment. The ball bearing engine has undergone very little alteration, which, however, is not surprising in view of its past successes. Adjustable spring tappets are provided, which should be especially handy should the valves be prone to stretching, and in those far apart periods when a Triumph engine does wear.

Finally, the brake pads are made of a special composition which is non-glazing, and thus gives a powerful grip in fine or wet weather. The pannier bags are of improved design, and have a more secure locking arrangement.

A new Precision engine for 1912. This 6 h.p. twin-engine has a bore and stroke of 75 x 85 mm.

P. and M.

For 1912 the alterations to the P. and M. are of a minor description. The engine dimensions remain unaltered. A foot starter is now fitted which is operated by a pedal on the right side. The pedal, when sharply depressed, revolves a shaft

carried on a bush through the 2 to 1 gear box, this shaft being connected to the pedal by a small chain. On one end of the shaft is a small chain wheel, on the

Engine unit of the new long stroke Norton.

other end are ratchet-faced teeth, which engage similar teeth on the mainshaft. On releasing the pedal these automatically become disengaged. The subsidiary-shaft is held out of engagement by a coiled spring. This, in conjunction with the half-compression device, enables rapid starting with one downward thrust of a pedal. This, of course, can be done with the wheels resting on the ground and with the rider seated on the saddle. The 1912 carburetter is of an entirely new pattern, combining great efficiency and simplicity. The single jet can be removed by unscrewing one screw; the air and throttle pistons can also be withdrawn simultaneously by the removal of one screw, both these screws having the same sized head, which fits the small B.S.A. key supplied with the machine. The float chamber cap is instantly detachable, being held in position by a flat spring of the same type as used on a magneto contact breaker cover. The petrol level is adjusted by means of two small nuts threaded on the needle valve stem.

Illston and Smith

are manufacturing a neat lightweight motor cycle engine of 76 mm. bore x 65 mm. stroke. It is fitted with a mechanically operated inlet valve situated directly over the exhaust valve. The magneto is carried behind the cylinder and is gear-driven. A simple form of adjustable pulley is fitted. There is a neat half compression device, which works as follows: The tappet has a D-shaped extension on the bottom end, which when parallel to the flywheels works in the ordinary manner, but when turned through an angle of 90° is brought over an auxiliary lever and operated by a half compression cam. Both tappets are adjustable. The inlet valve is detached by a single ring nut. The flywheels are exceptionally heavy, being 7 in. in diameter and weighing 14 lbs. The crankshaft is supported on ball bearings. The lubrication system is quite novel, the oil being led into a well at the top of the crank case, into which

Power unit of the new Illston and Smith lightweight.

the piston dips. The valves are of large proportions. The Illston and Smith machine has been designed by Mr. H. A. Smith.

Forward.

The 1912 twin 2 $\frac{1}{2}$ h.p. Forward will have several minor improvements. Instead of having a dropped top tube, the whole frame has been lowered and a straight top tube is employed. The tank, which has been redesigned and made considerably neater, is now carried on two lugs brazed solid to the lower tube. The inlet pipe has a more direct flow than previously, and the Amac carburetter is employed. The machine will be fitted with a larger saddle (Brooks 130 size 3) and the wheels are shod with 26 in. x 2 in. square tread rubber studded tyres. A ladies' model (which we illustrate) will also be shown for the first time at Olympia.

With reference to the paragraph in a recent issue respecting the Enfield Cycle Co.'s gear, the firm is not selling the lightweight two-speed and free engine device, but is willing to supply the heavier type of Enfield two-speed and free engine gear suitable for machines up to 8 h.p.

New lady's 2 $\frac{1}{2}$ h.p. twin-cylinder Forward.

ACCESSORIES OF THE SHOW

By R. Jones

Bluebel.

We recently visited Bluebel Bros., of Wolston, and were shown several neat motor cycle fittings, notably an attachment consisting of side wings to be fitted to existing mudguards. These wings clip on to the bead of the guard so neatly that the joint is hardly noticeable, and yet are easily detachable for cleaning or tyre repairing purposes. We were also shown a plug in which enamel is used instead of packing washers, and which is absolutely compression tight; also a pump with folding foot stirrup, which is now fitted with a light metal lining to prevent the possibility of warping.

Forward Fittings.

Two neat accessories are being marketed by the Forward Co., namely, a new belt fastener, illustrated herewith, and a new sparking plug which it is claimed will

The new Forward belt fastener. The hook, of which three sizes are supplied, works on hardened steel roller bearings.

never soot up. The chief advantage is that the central point lies in a small hole formed in the cup-shaped end piece.

Cycar Tyre.

Cuthbe and Co. will be exhibiting the Max Cycar tyre, recently described in *The Motor Cycle*. This is a really substantial cover for powerful machines designed to propel a sidecar. A belt which was used with great success in the Irish End-to-end record ride and in numerous hill-climbs during the past season will also be on view. Another speciality of this firm is a butt-ended inner tube and also Leakure, a new puncture preventive, which neither damages the tube nor prevents patches from sticking. A further novelty is the idea of selling pedal rubbers by the yard, so that a pedal rubber of any length can be cut off to suit any type of pedal.

Kerry combined steel and rubber studded cover.

Kempshalls.

The 1912 Kempshall tyre is made exactly on car lines, and not manufactured by wrapping the tread on to a drum. These tyres will be found on Stand 181. The cover is made under tremendous hydraulic pressure, with the result that the tyre is turned out a better shape. Great care is also taken to make the tyre fit the standard rims absolutely exactly, so that nipping of the tube is impossible.

The chief types are the anti-skid pattern, the tread of which has been slightly improved, and the non-skid cover, which remains outwardly the same, but of course both types are now made under the new process.

Section of the Midland Tyre Co.'s lightweight motor cycle tyre.

Palmer.
